SPOTS ON FINGER NAILS.—The white spots which appear on our finger nails are due to the variable nutrition of the nails. When the vital forces are vigorous and every part of the body is supplied with good blood, their growth is steady, and there is uniformity in color and consistence. It is a peculiarity in the growth of the nails that if a person experience a severe attack of disease, or some strange shock to his organization, the nails will indicate it. There will be a change of color, a partial cessation of growth, and as they emerge from the skin, ridges may appear. In some remarkable cases the nails have dropped out as a consequence of illness.—*Phrenological Journal.*

GRAY HAIR.—The causes of gray hair are numerous. One that is fundamental is inheritance; another is weakness of constitution; another is improprieties of life, or bad habits, while climate also has something to do with it. Where it is constitutional for the hair to grow gray early, the effect upon the health is nothing. It is the opinion of a good medical authority that most of the cases of premature gray hair are due to the "fast" or dissipated habits of young people.

The Week.

After a long continued storm of rain, the warm snnshine bas made its appearance and seems to revive the drooping energies of men, as well as to start into more rapid growth the vegetation in the fields of the farmers. It is to be hoped that the genial temperature may continue during the proper season, and add hy its influence to the speedy maturity and abundant quantity of the coming crop. Our jobbing merchants are full of business; the outside orders are not large, but such as the necessities of the interior demand; and their smallness compels them to he more frequent, consequently keeping the dealers more continuously employed. The trade of the State and the slope has never heen in as sound a condition as it is at present. Buyers have learned the danger of excessive purchases, and the sellers prefer to fill moderate and sure orders, rather than to incur the risk of filling more ample ones.

Our mining interests are progressing upon a sure and safe hasis. Investors are exercising, as a general rule, more care and caution in their investments, and require positive proofs of excellence in mines before emharking in their exploration and development. When—if such should ever be the case—the operations in this channel are conducted upon rigid, economical and careful principles, mining will cease to be any more speculative than the purchase of a stock of goods in the hope of disposing of them to customers. It must then become the leading industry of the Pacilio coast.

The warm weather will soon set the hydraulic mines "booming" again, and there has heen so much snow this winter that an ahundant supply of water is stored up for the season, which is expected to he a prosperous one.

The arrangement has been completed whereby the Pacific Coast Blood Horse Association bold the spring meeting on the Bay District course. In all prohahility the races will he the best ever held in the State.

In the Parliamentary elections in England the Liherals have gained 58 seats and lost 17, while the Homo Rulers sbow a gain of tbree seats.

Active Outside Mining Centers.

While the mors productive mines and mining localities of California are gensrally diffused throughout the metalliferous regions of the State, a like condition of things prevailing also in Utah, the mineral wealth of most of our neighhors appears to have been largely aggregated in isolated and oftsn widsly separated districts. Thus there are in Nevada not more than a dozen camps that have been much distinguished for their output of hullion, while in Arizona, Idaho, Montana and even in Colorado, the number is still less.

Having recently had something to say about the condition and progrsss of mining in Utah and California, we add here some remarks on the outlook for this industry at what promises to hecome very soon some of its more active centers in Idaho and Montana. In the former, these localities, judging from presant appearances, will prove to he the Carihou district and the Snaks River country in the southsrn and southeastern, and the Salmon Rivsr region in ths central part of ths Territory, into which a considerahle population is likely to be attracted the present spring. To Snake river there will not he such a rush this year as there was last, only such miners returning as have ditches for introducing full and steady supplies of water on their claims. Those who depended upon wheels and like expedients for raising water from the river upon their claims, fonnd these means so uncertain and inadcquate last year that they will hardly care to experiment further with them hereafter; hence there is likely to come less disappointment to those seeking to operate on that stream in the future. As the Salmon River and Yankee Fork country lie pretty well in the interior and ie very elevated, the working season there will not open until late in the spring, notwithstanding the mineral deposits are of a character calculatsd to stimulate the adventurous to earnest efforts at making their way into them.

Of the Caribon mines very glowing accounts reach us as well through the press of Idaho and Utah as through more private hut equally reliable channels, leading ns to think that they will draw to them hoth capital and population at an early day; they heing more easy of approach from the great central lines of travel, and situated in a less snowy country than the Salmon River mines. The deposits here consist of gold-hearing quartz, the lodes being of great size, the ore rich and the metal free; conditions that ought to make these mines attractive alike to tho prospector, the lahorer and the capitalist, all of which classes are said to he pretty well represented in the district already. As usual, some of our most shrewed San Francisco investors have managed through their agents to ohtain large interests in this Idaho Carihou, in advance of its great merit gaining general publicity. Not here, however, as at Silver Reef, Frisco, Uinta and other localities in Utah, bave these sharp operators been ahle to secure the entire wealth, or perhaps even the choice properties in the district, these latter heing altogether too numerous to bave heen corralled by any one or even several parties, however shrewdly they may have managed or whatever their financial strength. It would appear, in fact, that locators there have felt such confidence in the ultimate outcome of their claims, that they have heen in no hurry to dispose of them, preferring to hold on and develop them rather than part with them at mere nominal prices, a circumstance tbat speaks well for the permanent prosperity of the district.

In Montana mining operations are destined to he especially lively the coming summer in the Butte district, where the Walker Bros., of Salt Lake City, are large interested, having invested there in mining properties and improvements to the extent of a million dollars, or more. For taking the general supervision of their large interests and operations at that point, these parties have secured the services of Prof. J. E. Clayton, who is already on the ground, and will hereafter give to the work his individual attention. For filling this important position the proprietors could have made no hetter cboice, a factof which they were douhtless well advised through their hnsiness relations and intimate acquaintance with Prof. Clayton, extending over a long series of years. The situation, it is reported, will he made one of great pecuniary advantage to tbe Professor.

The Mechanics' Fair.—The managers of the Mechanics' Industrial exhihition have decided to commence the fifteenth annnal exhihition on the 10th of August, and to continue it five weeks from that date. The following gentlemen constitute the Board: President, Irving M. Scott; Vice-President, P. B. Cornwall; Treasurer, J. A. Bauer; Directors—A. L. Fish, C. Waterhouse, James Drury, Nathaniel Hunter, Samuel Dinsmore, David Kerr, A. W. Starbird, F. A. Frank, Edward Fretwell, J. R. Wilcox and Geo. H. Hopps. It is to he hoped that all our mechanics and manufacturers will hegin in time to prepare their displays, and that we shall have a better exhihition than we ever had hefore.

The United States steamer *Pensacola* left Panama on March 12th for this port. She will stop at all the ports on the way, and may be looked for here the latter part of this month.

The Pleasure of Labor.

Wben tbe fiat of omnipotsncs was nttersd to man: "In the sweat of thy face shalt thon eat bread," there was an intermixture of mercy in the punishment hy toil then decresd, and the self-consciousnsss of duty performed mitigatsd the sesming harshness of the penalty.

Wben the toiler has accomplished his allotted task the sensation of having done so, blended with the anticipation of peaceful rest, produces a pleasnre and a delight whicb ths idler can never experience. To have lahored with an object in view, and to have accomplished the desired result, is a gratification which rsnders tbe toil less irksome and lightens ths fatigue attendant upon it.

In whatevsr field of labor man may put fortb his exertions, the satisfaction of seeing the consummation of his efforts creates a joy which amply compensates him for having labored. If he is working for recompense, the receipt of his earnings gives to him the proud fesling of indepen-dence and of self-sustaining powers. He receives the trihuts for his lahor as a just return for it; it is his hecause he has given his strength of muscle or of brain for it. The obligation was mutual hetween the employee and the employer. One had the means with whicb to purchase, the other had the lahor to sell. Of the two the lahorer stood upon the firmest pedestal. The riches of the one might "take to themselves wings and fly away," hut the hrawn of tbc otber would always he availahle.

The autbor may have passed long years in gatbering the facts or the knowledge which he transcribes on the pages of his volume; but when the task is finished and the hook goes forth to he scanned by his fellow men, he feels a glow of pleasure in having awakened from their dormant slumber in his brain the ideas which shall create iu his readers sensations of delight or thoughts of an elevating nature. If he has added to the general intelligence of the world; if his words have given strength to the weak; if they have nerved the wavering to steadiness of purpose; if they have dried tho tear of sorrow; if they have brought into existonce the cbeering smile, or the kindly glance, he knows that his toil has not heen in vain, and there comes to his soul a reward which is above all price when he considers the benefits he has conferred npon his race.

The artisan may etrike heavy blows and tax his muscular power to its utmost extent as he forges the shaft, or tempers the tool with which to complete bis work, which, wben finished, he exhihits with honest pride, as its utility and excellence of design are self-cvident to all. If by it he has lightened the hours of toil; if be has increased the power of production; if he has made the seasons of rest to the wearied ones longer and more frequent; if he has given to the homes of all more comfort, heauty and cheerfulness; if he has rendered life's hurthens less difficult to hear, he must find a gratification in the result of his labors sucb as tbe drono could never know.

If the toiler is working for the support of his family how will his heart throh with delight as he witnesses the happiness which the expenditure of his wages hrings into his home. His fare, simple though it may he, seems to him like a luxurious and sumptuous hanqnet, sweetened as it is hy the glad satisfaction that he has added to the joy of the loved ones there. If he has brought to tbem pleasing apparel; if he has given them wherewith to adorn themselves; if he has found for them the long-wished-for object, even if it he hut a trifle in itself; if be has hrought to them the volume, the picture, or some article of utility; if he has contrihuted to their joy or their happiness, he finds his own still more augmented as he receives tbeir grateful acknowledgment for his kindly gifts.

Does not the artist, in the rich enthusiasm which pervades his soul, as the delineations of his conceptions of the heantifnl are traced in hrilliant hues, or cut from the Parian, experience a delight which seems to transcsnd all earthly hliss, and he far deeper and purer even for a hrief moment, than the pampered idler could experience during the whole period of his existence.

Lahor adds to the complete development of the physical and mental powers. It creates a healthy condition of the hody and mind, and such a condition is always conducive to happiness. Lahor does not depress; it recuperates and strengthens, and in the full flow of spirits and the flush of physical well heing, there arises a pleasure and enjoyment that indolence can never hring into action.

H. B. M. frigate *Triumph*, flagship of the Pacific squadron, Commander Rear Admiral Frederick H. Sterling, arrived at this port on Saturday last, 18 days from Acapulco. The *Triumph* is an armor-plated frigate of the first-class, carries 14 guns of heavy caliher, measures 6,650 tons, and her engines have a nominal horse-power of 800, capahle of heing worked up to 4,892.

Bodie has levied assessmsnts aggregating $2,480,000. Its dividends have heen $2,850,000. Excess of dividends, $369,500. The dividends have *all* heen paid hy two mines, viz.: Standard, $1,650,000; Bodie, $1,200,000. Only $75,000 were put into these two mines, which produced nearly $3,000,000.

Mineral Department of the University.

We ses it statsd that tbe item of $31,000 for the Univsrsity of California, in the Assembly gsneral appropriation bill, has heen reduced to $15,000. This reduction of $16,000 is exactly the amount asked for equipping the Dspartment of Mineralogy and Economic Geology, and it appears likely that that department will go hsgging again.

It is significant, at the same timo, that Wasson's hill, for the establishment of a mineralogical collsction in San Francisco—to which we have prsviously rsferred at length—has passed ths Assembly.

As this bill practically duplicatss tho department, collsctions and functions at the Universitv, its friends have douhtless besn instrumental in striking off the $16,000 above refsrred to. This money is absolutely necessary for the equipment of the mining department of the University, in order that it may discharge evsn its strictly University functions. The mining department will he sadly crippled unless this monsy is voted. If ths mining bureau, to hs established by Wasson's hill, is only to collect mineralogical specimens, as it appears, there is absolutely no demand whatever for its existence, since its functions can he hettcr performed hy the University, where there are now the State Geological Survey collections, those of H. G. Hanks, F. L. A. Pioche, C. D. Voy, and a large amount of material from other sources. These collections are tbe best in the State and a new bureau could not collect one as good in the aggregate in ten years. While a mining hureau might be useful if scope enough were given to it, the single collection of minerals will he of little henefit to practical miners, since the University can furnish all that is desired in that direction. Whether Mr, Wasson's bureau is established or not, we hope tbe mining department of the University will not he crippled for lack of a few thousand dollars to equip it.

Legislative Matters.

A great deal of time has heen occupied tbis week over the discussion on the dohris question, but we have not the space to give the argument and statements made. No decision has yet been arrived at. The tax whicb will fall upon tbe varions counties under the proposed hill to keep the debris off tho farming lands by huilding dams is as follows:

Alameda, $20,843.44; Alpine, $284.82; Amador, $1,270.70; Butte, $5,250.77; Calavcras, $991.29; Colusa, $5,668.26; Contra Costa, $3,518.47; Del Norte, $333.84; El Dorado, $1,163.73; Fresno, $3,036.68; Humboldt, $2,559.37; Inyo. $867.64; Kern, $2,756.96; Lako, $1,078.20; Lassen, $611.88; Los Angeles, $7,895.02; Marin, $3,983.28; Mariposa, $738.65; Mendocino, $3,003.42; Modoc, $545.46; Merced, $2,517.05; Monterey, $3,626.40; Napa, $3,998.29; Nevada, $3,516.59; Placer, $2,917.82; Plumas, $1,022.48; Shasta, $976.78; Sacramento, $8,998;25; San Bsrnardino, $1,204.19; San Diego, $2,083.59; San Francisco, $127,432.95; San Luis Obispo, $2,072.95; San Mateo, $3,255.80; Santa Barhara, $2,093.58; Santa Clara, $13,995.22; Santa Cruz, $3,254.39; Sierra, $809.84; Siskiyou, $1,319.01; Solano, $4,511.05; Sonoma, $7,774.33; Stanislaus, $2,712.55; Sutter, $1,994.06; Tehama, $1,919.73; Trinity $403.32; Tulare, $2,403.23; Tuolumne, $826.77; Ventnra, $1,518.09; Yolo, $4,966.48; Yuha, $2,145.70; San Benito, $1,905.11. Total, $293,483.05. Thcse figures are hased on last year's assessment rolls.

The Assemhly passed the Tuttle-Braunhart mining bill hy a vote of 44 to 17, hut the Senate Committee has amended it very materially. David McClure appeared for the hrokers, and claimed that the Legislature had no power to impose a tax for a Mining Commission under the Constitution. The committee thought the same way, and struck ont all that part of the hill imposing a tax. Section 5, providing for liling a hond hy corporations outside of the State, was struck ont. That part of Section 7 requiring officers of mining companies to file bonds was struck out, as was all that about perqnisites of the Commissioner. As amended, the hill is completely nullified.

The Committee on Corporation have reportsd for passage Senate bill No. 60, providing for the rsmoval of officers of mining companies. Wasson, of Mono's, Mining Bureau hill led to another dehate—May, Merry, McCallion, Braunhart and McIntosh opposing the hill, as it took $30,000 from San Francisco and created useless office, entailing great expense.

It was defended hy Tyler, Anothony, and others. The hill was passed—ayes 44, noes 24—May changing and giving notice of reconsideration.

In New York Govcrnment honds are quoted at 107 for 4s of 1907; 103½ for 5s of 1881; 109½ for 4½s; sterling, $4.86@$4.89; silver hars, 114½; silver coin, ¼ discount huying, par selling.

Company C, Sixth Cavalry, has heen ordered from Arizona to New Mexico, to assist in the protection of the settlers of that section.

The death of Rear Admiral Thatcher, U. S. N., is announced from Boston.

The Sun.

As Described by Prof. R. A. Proctor.

The citizens of San Francisco have enjoyed a rich and rare privilege during the past week in listening to a series of three lectures from that world-renowned scientist and physicist, Prof. Richard A. Proctor, of the Royal Astronomical Society of England. The audiences have been the most select of any which have ever greeted a public lecturer on this coast. Every seat in the large hall has been filled at each lecture, and even the standing room has been crowded, until it has been necessary to discontinue the sale of tickets even for the privilege of standing. The first lecture was delivered on Monday evening, at the Mercantile Library hall, and is the only one for a report of which we have space in the present issue. The subject,

"The Glory, Nature and Magnitude of the Sun,"

Was most ably treated, and a well digested review was given of the most recent scientific researches into this particular sphere of astronomical study. The lecture was profusely illustrated with brilliant stereopticon views of the solar system, and of the sun in all its varied and interesting phenomena.

It is easy, said the lecturer in opening, to estimate in figures the magnitude of the sun and its distance from the earth, but it is difficult to convey to the mind any correct idea of what those figures really represent. The lecturer had in early life endeavored to gain some idea of the magnitude of the American continent; yet he had but recently been able to form any really adequate idea of it—and that was accomplished only through crossing it by rail. It is easy to say that the sun is from ninety-two to ninety-three millions of miles distant; but a railroad journey that distance would require 500 years. A cannon ball, moving at its initial velocity, would require thirteen years to get there, while the report would not reach the sun until half a year later. Another interesting illustration in this direction has been given by supposing a human arm extended from the earth to the sun; 130 years would be required for the nerves to inform the head that the fingers were burned by coming in contact with the solar surface. The sun possesses a most

Wonderful Power of Gravity.

It controls the entire solar system and keeps all the planets in their order, as they continue in their grand, silent progress through space. So great is its power of attraction, that a half-ounce weight, if raised above the surface of the sun and dropped from rest, would acquire a velocity of 435 feet in the first second. Its magnitude is 108 times the diameter of the earth, and exceeds it in volume 1,252,700 times.

The Heat of the Sun.

To form an approximate idea of the heat of the sun, we must remember that it is estimated it would require the heat from 11,700 trillions of tons of coal, consumed in every second, to produce a heat equal to that diffused by the sun in the same space of time. Of all this immense emission of heat, only one part in 230 millions falls upon the earth. All the rest appears to us to be wasted in space. Yet this seeming waste has doubtless a meaning, and is probably subservient of some other kind of work or good, associated with the great whole of the universe. Without the heat which results from solar rays, every form of life on earth would cease. The same is true, relatively, of all stars, which are suns to other systems. A beam of

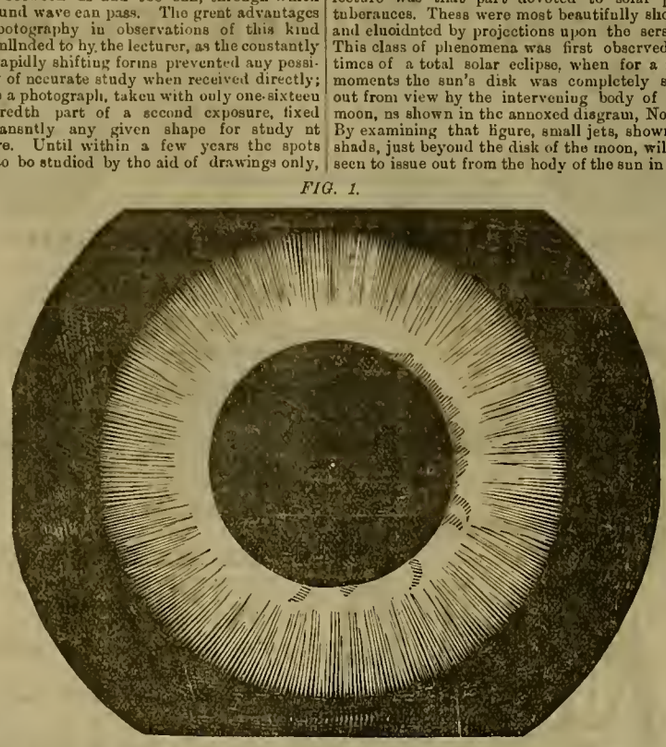
The Sun's Light

Is 150 times more intense than that of the lime light—such as the lecturer was using to project his illustrations upon the screen. We know this, in degree, from the fact that when the lime light is placed between the observer's eyes and the sun, the lime light appears as a black object. Even the intense light of the electric arc is one-third less than that of the sun. The sun is brighter in parts than it appears to the eye. Floating in its upper atmosphere are clouds of intense brightness, many times brighter than the average glow of that luminary. These clouds are technically known as "rice grains," which give to the sun, as viewed through a telescope, a fine mottled appearance. This was beautifully shown upon the screen. These clouds are thought to emit 99% of the sun's light. But, instead of being composed of the vapor of water, as clouds in our atmosphere, they are the vapors of iron, magnesium, calcium, copper, etc., heated to an intense degree of luminosity. Another class of most important and interesting phenomena is what is known as

Sun Spots,

Which were shown in a most strikingly vivid manner from photographs of the sun's face, as taken by Dr. Rutherford. These views were telescopic, and portrayed the lights and shades of the sun's surface in a most striking manner, showing the spots with long, cirrous threads, now radiating *from* the spots and again seeming to reveal an inward draft towards the sun's center. The physical characteristics connected with these phenomena were briefly alluded to and explained so far as science has penetrated into their mysteries. Every change in one of these spots, said Mr. Proctor, must be accompanied with atmospheric turmoil and disturbance, to which the most terrific phenomena of tornadoes and volcanic eruptions upon earth are but gentle zephyrs and harmless detonations. The terrific noise by which they must be accompanied is such as no human ear could hear; but which is utterly lost by the great void between us and the sun, through which no sound wave can pass. The great advantages of photography in observations of this kind were alluded to by the lecturer, as the constantly and rapidly shifting forms prevented any possibility of accurate study when received directly; while a photograph, taken with only one-sixteen hundredth part of a second exposure, fixed permanently any given shape for study at leisure. Until within a few years the spots had to be studied by the aid of drawings only,

FIG. 1.



which were generally quite imperfect. The lecturer here jocularly alluded to such exaggerations in a book on the sun, published a few years ago "by a man named Richard A. Proctor." The question,

Of What the Sun is Composed?

Was briefly discussed. Some progress had been made in the solution of this question, but only enough to discover that we know but very little about it. The principle of spectrum analysis was explained by beautifully illuminated diagrams in colors; also the manner in which the principle was made applicable to determining the nature and composition of the heavenly bodies. By the use of the spectroscope it has been most unmistakably shown that quite a number of elements known on the earth existed also in the sun, and that some elements existed there which are not known on earth. Among the elements common to both were sodium, calcium, magnesium, aluminium, hydrogen and several others. The existence of oxygen in the sun was somewhat uncertain in the minds of many; while others, including the speaker, Prof. Young and several other prominent astronomers, believed that its presence in our luminary had been fully proven. One new metal, unknown here, was instanced, and had been named by Prof. Young, helium, from *helios*, the Greek for sun.

Solar Protuberances.

Perhaps the most interesting portion of the lecture was that part devoted to solar protuberances. These were most beautifully shown and elucidated by projections upon the screen. This class of phenomena was first observed at times of a total solar eclipse, when for a few moments the sun's disk was completely shut out from view by the intervening body of the moon, as shown in the annexed diagram, No. 1. By examining that figure, small jets, shown in shade, just beyond the disk of the moon, will be seen to issue out from the body of the sun in the form of flames. When properly observed, these jets have a red, flame-like appearance, and the spectroscope has revealed to us the fact that they are really tongues of flame or incandescent gas, which are now known to shoot up from all parts of the sun's surface to the distance of fifty, an hundred, and even, in one case, at least, to the enormous altitude of 210,000 miles. Astronomers are now enabled to make their observations at any time, without any regard to the presence of an eclipse. These flames are supposed to be caused by explosions or eruptions from within the more solid portion of the sun's body. The lecturer gave it as his opinion that the flames seen, which are known to consist of hydrogen, sodium and magnesium gases, merely mark the track of more solid, but unseen matter—molten material—just as the flame and smoke which issues from the mouth of a cannon, marks the track of the unseen ball.

FIG. 2.

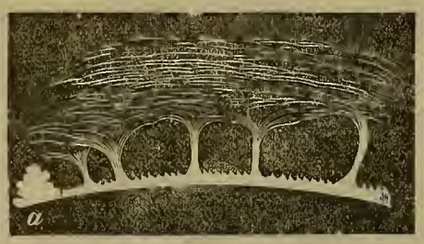


FIG. 4.

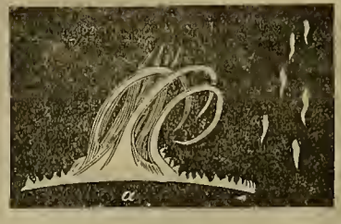
FIG. 3.

Remarkable Explosion in the Sun.

One of the most remarkable of this class of phenomena ever observed by any scientist, occurred some ten or eleven years ago, while Prof. Young, the well-known American astronomer and scientist, chanced to be observing our solar luminary. A description of this phenomenon formed a most conspicuous, and perhaps the most interesting part of the lecture, and the phenomena itself developed an outburst of solar energy most remarkable for its suddenness and violence, and one which shows what *can* be done in the way of explosions when all the conditions are on a scale of grandeur commensurate with the magnitude and anomalous physical energy of our great solar luminary. So much interest attaches to this portion of the lecture that we herewith produce several very perfect drawings of the stereoptic views, with which Mr. Proctor most happily illustrated his remarks. Those who were present cannot fail to observe the perfect accuracy in all the detail, with which our artist has reproduced them.

FIG. 5.



While viewing the sun, and studying a tree-like prominence, shown by the lecturer, but not reproduced here, Prof. Young noticed a smaller mass of cloud to the left, glowing with a brightness quite superior to any other portion. The tree-like prominence gradually passed away and assumed the very peculiar appearance as shown in figure 2—the glowing cloud upon the left still remaining but little changed, as at *a* in the same figure. The length of this cloud, by careful measurement, was about 100,000 miles, by some 54,000 in hight. Just at this moment the Professor was most unfortunately called away and was absent about half an hour. When he returned, the whole thing had been literally blown to shreds by some inconceivable explosion or up-rush from beneath. In place of the quiet but threatening cloud which he was observing when he left his instrument, his vision was greeted by the remarkable appearance as shown in Fig. 3, with "the little bright cloud" disrupted, as shown at *a* in same figure. Some portions of the fragments, or fusiform filaments, into which the larger cloud was separated, reached the enormous hight of over 200,000 miles. These filaments gradually faded away like dissolving cloudlets, while the little disrupted cloud at *a*, Fig. 3, grew and developed into a mass of rolling and ever-changing flame, to all appearance. At one time it rose, as in Fig. 4, to a hight of 50,000 miles. Then it was drawn out into long filaments, which were most curiously rolled backwards and downwards—something like the volutes of an Ionic capital, as shown in Fig. 5. Within the space of about an hour and a half, it had entirely disappeared.

It was remarked by the lecturer that the velocity with which the eruptive matter, as shown in Fig. 3, left the sun's surface, was 500 miles per second—a velocity so great that it could never have returned to that luminary. It was thus, no doubt, that the sun was forcing from itself matter which could never return to it—a power which the earth and all the planets, great and small, possessed in their original, incandescent state.

It was remarked that, after all, our best astronomers know but very little about the sun, and, with a singular paradox, all their greatest discoveries have been made while that luminary was in the utter darkness of a total eclipse. In fact, the best knowledge which a man can acquire, under any circumstances, is most incomplete and unsatisfying to the earnest and intelligent seeker after knowledge.

There was more than ordinary interest manifested as the distinguished lecturer proceeded with his address, and as each illuminated diagram was in turn projected upon the screen and dilated upon with a clearness and distinctness which held his large audience with a most silent and enwraped attention, the fact must have been apparent to him that the highly pleased company of intelligent faces before him came to learn, and were all most intensely gratified.

Mr. Proctor, in conclusion, spoke of

The Mysteries of these Infinities

And how bewildered and lost the human mind becomes in contemplating such vast magnitudes and distances, as are involved in the science of astronomy. He took his leave of his audience after reciting the following lines from Shelly:

> In the interminable wildness
> Of worlds, at whose immensity
> E'en soaring fancy staggers,
> Here is thy fitting temple;
> Yet not the lightest leaf
> That quivers to the passing breeze,
> Is less instinct with thee!

Close Working of Ore.—Mr. Miles B. Dodge, of this city, whose experience impressed him with the idea that we crush nine-tenths of our gold ores too fine in California, has been experimenting on the subject for some time. He thinks gold ore should not be crushed any finer than is necessary to pass through a No. 20 screen, and that if it is, loss is sure to ensue. Mr. Dodge has crushed some ore from Georgetown, El Dorado county, for Mr. P. J. Beardsley, passing it through a No. 20 screen, and afterwards concentrating it. This ore has been tested by Kustel & Riotte, at Mr. Beardsley's request. The ore assayed originally $15.07 per ton. Crushed through a 20 screen and concentrated, the concentration assayed $7,146 per ton. The tailings assayed only a *trace* of gold. Messrs. Kustel & Riotte say that several lots concentrated in the same way have given extraordinary results, similar to the above; and Mr. Beardsley verifies their statement. This is working ore very close.

Foreign Stump-Pulling on the Pacific Coast.—We read in an Eastern exchange that a company has been organized at Glasgow, Scotland, to go into the business of stump-pulling in Oregon and Washington Territory on a big scale. They will use a portable steam apparatus, which will, it is said, lift several trees a day bodily, by the roots.

A grand banquet was given at Paris, Sunday last, in honor of Nordenskjold, the Arctic explorer.

John Swinton declines the nomination for President tendered him by the National Labor party.

A NEW USE FOR THE POTATO.—A material that can be carved may be made out of peeled potatoes, which is prepared for this purpose by being first blackened for thirty-six hours in eight parts of sulphuric acid to one hundred of water; it is next dried with blotting paper, and then pressed. The French now manufacture pipes, in close imitation, it is said, of meerschaum, from this novel substance. A heavy pressnre gives a material so hard, that good billard balls, in imitation of ivory, can he made from it.

AN INGENIOUS DEVICE.—A window blind that can be converted into an awning has been long sought after, but it was reserved for the E. P. Pierce Manufacturing Company, 32 Hawley street, Boston, to solve the problem with their patent improved binges and fixtures. They now offer a unique arrangement for the immediate change of a closed and well-fastened blind into a perfect screen.

TO CEMENT VULCANITE.—To cement together two pieces of vulcanite, melt together equal parts of pitch and gutta-percha, and add about one-fiftb part of shellac. Stir until a perfectly homogeneous mixture is obtained. Use hot (avoiding excess), and submit the joint to strong pressure until the cement has properly hardened.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and hand Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swazing, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid

Kendall's Spavin Cure

Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the hunch without blistering.

Office U. S. Marshal, Western Dist. of Michigan, Kalamazoo, April 15th, 1879.

B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse estored to usefulness. Very truly yours, JOHN PARKER.

Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

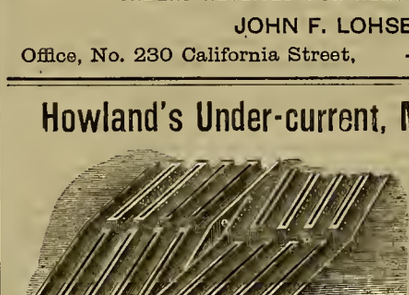
Office, No. 230 California Street, - - San Francisco, Cal.

Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

GEO. S. LADD, President. ANDREW WHITE, Secretary.

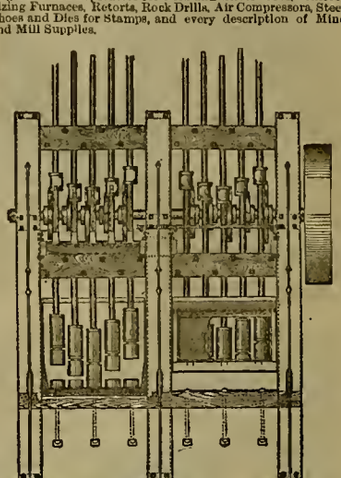
Grinding and Amalgamating
MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlorodizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Mecker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter.*

CONTINUED FROM PAGE 229.

double compartment working shaft is down 100 ft; ore taken out at bottom of the 100 ft shaft looks finer than any on the dump. At the Silver Nugget, the ore output of this mine has averaged for the last 10 days $1,000 a day. On the Golden Eagle, the vein at 160 ft in depth shows by actual measurement 16 ft 6 inches between walls. The hanging wall carries 8 inches of talc, and the foot wall 4 inches. Ore, whole width of ledge, averages and assays $45 in gold to the ton. The present developments have exposed fully 4,000 tons of ore.

HEAD CENTER.—Tombstone *Nugget*, April 1: Rich ore, carrying free gold and horn silver, seemingly in large bodies, has been taken out, which gave an average assay for the entire production of $250. The first level is in carbonate ore, and is drifting south 40 ft on its way to the old shaft, which, when completed, will be 190 feet. The second level is down 210 ft, from which there is a prospect out of 15 ft, which shows a ledge 6 ft it width, in which are free gold and horn silver, some the richest specimens we have ever seen in camp, and the vein matter shows up largely as the work advances.

EMPIRE.—Has upon its dump 150 tons of ore, which yields an average assay of $125 to the ton. The old shaft is down 200 ft, from which a level runs southerly on a gouge, and a crosscut runs east, which is now in 70 ft, all in ore, some of very high grade, and is improving every day as to quantity of rich ore. The new shaft is down 95 ft.

SILVER KING.—Tucson *Citizen*, Mar. 27: The working shaft is down 400 ft, but no ore is being taken from it at present. A Mr. Swain, of Oakland, has purchased the tailings from the Silver King mill, and will soon erect suitable machinery for working them. The "'76" mill has changed hands, passing into the possession of Eastern men. Superintendent Mason, of the Silver King, is erecting a $10,000 residence, which will be quite an ornament to the place. There are about 200 men at work on the Silver King.

DAKOTA.

HOMESTAKE.—*Black Hills Times*, Mar. 31: The mills of this company are now turning out over $200,000 a month, on the lowest grade rock they have. A body of ore has been struck in the lower level, and as soon as this remarkable mass of quartz is sufficiently exposed, the stamps will be fed on it, when the clean-ups of the Homestake will be $500,000 a month, instead of $200,000 as at present. It is confidently believed that the new ore body will yield from $20 to $40 per ton.

SNOW STORM.—The clean-up amounted to 370 ounces, which is 60% gold, from 10 tons of rock. They expected to make another clean-up of 400 ounces, after which the mill will shut down until the roads become passable for loaded teams.

ESMERALDA.—Has been working since Nov. 20th, and has turned out $30,000 in bullion. There is in this mine a body of ore 30 ft thick, that will mill $7 to the ton.

GALENA DISTRICT ITEMS.—The excitement created by the rich strike in the Cora still continues in that section. A large number of tunnels have been run into the mountain upon which the native silver ore was struck, and in every one mineral has been found. This veiu seems to extend the whole length of the hill. The Washington mine, the most extensively developed on the new belt, has a vertical vein of this rich rock, while the ledge in the Cora and others is flat, but pitching.

IDAHO.

IDAHO SPRINGS.—*Iris*, Mar. 20: The property of this company consists of 11 lodes, to be developed by a crosscut tunnel, which will intersect them in the following order: Althea, Little Etta, Bulger, Manchester, Cleopatra, Underwood, Alma Brooks, Helen Bassett, Garoo, Winning Horse and Gilbert. The shaft on the Little Etta is 10 ft deep, and the crevice matter for a width of 3 ft gives a return of $50 per ton, selected specimens averaging as high as $300. A 30-ft shaft on the Manchester shows 10 inches of galena, worth $80 per ton. The Cleopatra shows about 16 inches of ore, assaying $210. The Bulger carries an 8 or 10-inch vein of decomposed ore, which yielded $50 per ton in gold from the grass roots. These mines are situated in Spring gulch, a tributary of Chicago creek, 3½ miles from town.

CHARLES DICKENS.—The second tunnel is in 160 ft. It is being run on the ledge, which is 12 ft wide. The width and richness of the veiu is greater than in the level above. A contract was let for the running of a tunnel still lower. It is now in 250 ft, and will tap the mine at a great depth. A large quantity of high-grade ore is being taken out, and the arastra will be kept constantly running as soon as spring opens.

CUSTER.—There is sufficient ore to justify the erection of a large mill, which is being built in San Francisco. Enough ore to keep the mill running a long time is in sight.

News in Brief.

THE Anglo-American cable is broken.

Mining Partnerships and Abandonment of Claims.

The Weske Gravel Mining Decision.

A very important mining decision was this week rendered by Judge Daingerfield, of the Superior Court, in the cases of Leet vs. Weske, and Leet vs. the Weske Gravel mining company. The actions were brought in the Old Twelfth District Court, in 1873, and they involved the ownership of a very rich gravel mining claim at Turkey Hill, Placer county, covering 160 acres. Judgment was given for the defendants.

The following is the full text of the decision:

Theso two cases are submitted together, and involve the determination of the same question, to-wit: whether the plaintiffs and intervenors have any rights to certain mining claims known as the Washington mining company's claims in Placer county, near Michigan Bluffs. If so, plaintiffs claim an accounting for the rents and profits, and a decree that defendants hold in trust for plaintiffs. The evidence shows that, in 1861, the original locators of the said mine, being a company of some eight men, had located and unsuccessfully worked the Washington mining claims, having been associated as a company from 1857 or 1858.

In the year 1861, the company mutually agreed to separate and leave the claim, saying "that it would not pay," and some saying that they "abandoned" the claim. They left their tools and mining implements, and departed, each going where he thought was most to his own interest. But one Drury, an original locator of the claim, remained in the company's cabin, and, by permission of some members of the company, worked in the moutb of the tunnel and "creviced," and used a rocker in taking out gold to support himself.

Weske was working in an adjoining claim, and in 1863, at the latest, took possession of the land in dispute, and openly used the same, employing from ten to twenty men daily in developing the mine. In the year 1870, or thereabouts, it was discovered that the mine was paying liberally, and then the plaintiff herein asserted a claim to an interest in the rich mining ground, which is the subject of this action.

He claims that one Drury occupied the land, and held it under a permit from him, and that thus his title was kept good for the six or eight years during which Weske was in the open, notorious, adverse possession, as claimed by him. The evidence shows that Leet purchased an interest in the property after the year 1861, for an overdue debt, and he says that he took possession under a bill of sale from one of the original locators. What he did, as sworn to by himself, was to go on the ground and take a little gold from the mouth of the old tunnel, and tell one of the original locators that he had bought an interest, and claimed a joint possession witb him.

The claim was a tunnel claim, and was so taken and held, and has been so worked, and not otherwise, and, in my opinion, no such occupation for a few hours, as Leet testified to, on his part would bo considered as possession at all. He never worked a day thereon afterward, never paid or tendered to Weske anything until the bringing of this suit, and although he preteuded to be the owner of an interest in the claim where Weske was working openly and notoriously, and claiming the mine as bis own for more than seven years, Weske never was informed of Leet's claim, until after the mine thus developed by him was a noted success.

The dissolution of tbe partnership, in my opinion, was complete in 1861, and if any one held thereafter, be held by actual, personal possession, as an individual, and not as a tenant in common or partner. The partners have never come together or asserted any rigbts to this mine since 1861, and at no time has more than one of them been near the claim, and then not to claim it as a partnership venture. In the case of Wariug vs. Crow, 11 *Cal. Repts*, tried before me in Shasta county, I held that the possession of one tenant in common of a mining claim was the possession of all, and the Supreme Court affirmed that decision and extended it to general partnersbips also. That was a living partnership, however, where all but *one* remained and worked, and tbat one went off, and on his return brought that suit to be put in possession; but it would be folly to hold that a single person remaining in possession *after partnership was dissolved* could hold for the *non-existing* body. The person remaining could only bold by new acquisition for *himself*. Tbus Leet's grantor, if he ever held any interest, only held a personal one by new appropriation, and only wbat he personally appropriated. There is no proof as to what this was. But before Leet acquired any interest to anything, Weske had a title by adverse occupation. It is claimed that Weske cannot dispute the original title, because he bolds the deed from one of tbe original claimants in the Washington mine. I do not so understand the law. At the time he took his deed from the original locator, or claimant, *his title* had become perfect by adverse use and occupancy, and under those circumstances he cannot be held as claiming under tbat title, but must be considered as buying an adverse claim, worthless in itself, perhaps, for the sake of peace.

Weske has been holding this property for several years under a patent from the United States. If Leet was a tenant in common in that land, he holds, in my opinion, for Leet; but I cannot find that Leet ever had acqnired, either by purcbase or possession, any interest in the land claimed.

Again, if Lect ever had a title to tbis mining ground, his claim was stale long before this suit was brought.

The rule is that an equity, such as is sought to be here enforced, must be speedily presented and an offer made to do equity by promptly contributing to the expense of the enterprise. If he knew that Weske was working 15 or 20 men a day, at an enormous expense, for six years and over, and did not offer in the night of adversity to relieve him of a portion of these expenses, it would seem unjust to permit him now to say, "You may keep all the money you made, after paying me what I did not help accumulate." He should have *promptly* contributed and been willing to share the losses before a court of equity would divide the profits with him. Before the acquisition of a Federal title to mining land, I know of no otber way of acquiring such property than by actual possession, or by claim under mining rules and regulations. No such rules are shown to have existed in this locality. Possession alone governed until Weske acqnired his patent thereto.

He holds, therefore, under actual continued possession, and by working on his claim for more than six years, adversely and notoriously claiming it as his own.

Leet does not and cannot hold it because it was abandoned before he pretends to have bought it, and because he has never done any substantial work upon it.

Weske holds it nnder a patent from the United States, and a judgment must therefore be entered in favor of defendants in both actions.

This case has occupied a great deal of timo, both before my immediate predecessor and myself, and on account of its very great importance financially I have thought it proper to give my views at greater length than the questions involved would warrant. The question of fact above decided was not solved in the same manner by my predecessor that I have decided it, but the proofs were different, and many additional facts were proven before me that were not before him, and there is no necessary conflict between us. Months have been spent in taking testimony, tens of thousand of dollars have been paid out in this litigation, and I sincerely hope that in this decision the law has been fairly anuounced and the facts set out. It is well that there should be an end of litigation, and I hope that such end is now reached.

Mining Maps.

Since the "mining boom" began to spread so widely, the literature of mining has increased, and many journals which never before paid any attentiou to the subject, are now publishing a mining column. A great many new mining maps are also being published, and we have received several this week.

The "Pocket Mining Atlas," compiled by Edwin Bolitho, of 27 Park place, New York, is a very handsome little publication, neatly bound in morocco. It has colored lithograph maps, on small scale, of the mining districts of Georgia and Michigan, of Deadwood district, Dakota, 6 districts in Colorado, 6 in Nevada; a map of Utah, Idaho, Montana, New Mexico and Arizona; also, one of Bodie district, California. It is the neatest publication of the kind we have ever seen, and very useful for mining men. Price, $1 per copy. The maps show signs of accuracy and care in their compilation.

R. T. Sorin, of Tucson, Arizona, has published a pocket companion, for prospector, investor and tourist, of the mineral fields of southern Arizona. It gives all tbe mining districts within 100 miles of Tucson, the supply depot of the camps of southern Arizona and Utah. Circular lines represent 25, 50, 75 and 100 miles distance air line.

Bancroft & Co., 721 Market street, in this city, have sent us a very handsome "Official map of the Territory of Arizona.

The map, constructed on a scale sufficiently large to admit every detail, exhibits the entire hydrographic system and the topography in clear relief, altitudes according to accepted authorities, public surveys (townships) as far as run; location of towns, settlements, ranches, mines, mining camps, mills, postoffices, all roads and stations, telegraph lines and offices, military and Indian reservations, pueblos, etc. Especial attention has been given to the location of mines and mining districts, the boundaries of which, together with county and reservation lines, are distinguished by appropriate coloring.

To enhance tbe utility of the work, an entirely new and important feature has been added: Along the several roads and between "stations," or other prominent points, the distances in miles and fractions are distinctly printed, converting the map into a graphic itinerary, more comprehensive and useful than the most elaborate classification in its usual form—an advantage which every traveler will readily appreciate. The map has been compiled by Eckhoff & Riecker, civil engineers. Pocket size on paper sold for $3, and on linen and roller, $5. Tbis is tbe best map of Arizona yet published and contains all the latest information.

"The Californian."

"Tbe *Californian*, a Western Monthly Magazine," published by "The A. Roman Publishing Co.," San Francisco, although only four numbers have been issued, has met with a hearty reception by an appreciative public. The following table of contents of the April number will give to those who have not seen the magazine, a good idea of its scope.

Sand, Chapter IV.....J. W. Gally.
The Story of Australia and New Zealand..R. E. Desmond.
The Hermit of Treasure Peaks.....Sam Davis.
Pallas.....Chas. H. Phelps.
Shepherds and Sheep-Herding, II..Robert Duncan Milne.
At Agua Tibia.....Agnes M. Manning.
Americanism in Literature.....Edgar Fawcett.
Captain Molly.....E. W. Ludlum.
The Ethics of Suicide.....Albert Williams.
Our Ophidian Friend.....John Vance Cheney.
Notable Autographs.....Fourquci.
Ruby.....J. H. S. Bugela.
Arizona.....James Wyatt Oates.
A Glimpse of the Unusual.....W. C. Morrow.
Outcroppings—"About Pets," "Waiting for the Galleon," "Pencil Shavings," "Ike gives his Opinion on Total Depravity," "A Stroll Through Chinatown," "Elsie," "The Voice of the Sea," "Under the Smilax," "A Vaquero's Love Song," "Winter Rain."

This able California magazine should receive the support of the literary community of the Pacific States in the most libcral manner.

THE freight-handlers of the Cbicago, Milwaukee and St. Paul railroad at Chicago bave struck for an advance of wages.

SHEEP and hogs are perishing by the score in upper Willamette valley, Oregon, under the effects of the late severe weather.

NELSON GOROM, Serg't Signal Corps, U. S. A.

HALL'S VEGETABLE SICILIAN HAIR RENEWER is a scientific combination of some of the most powerful restorative agents in the vegetable kingdom. It restores gray hair to its original color. It makes the scalp white and clean. It cures dandruff and humors, and falling out of the hair. It furnishes the nutritive principle by which the hair is nourished and supported. It makes tho hair moist, soft and glossy, and is unsurpassed as a bair dressing. It is the most economical preparation ever offered to the public, as its effects remain a long time, making only an occasional application necessary. It is recommended and used by eminent medical men, and officially endorsed by the State Assayer of Massachusetts. The popularity of Hall's Hair Renewer has increased with the test of many years, both in this country and in foreign lands, and it is now known and used in all the civilized countries of the world.

FOR SALE BY ALL DEALERS.

EVERY new subscriber who does not receive the paper, and every old subscriber not credited on the label, within two weeks after paying for this paper, should write personally to the publishers without delay, to secure propor credit. This is necessary to protect ourselves and subscribers against the acts and mistakes of otbers.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Consolidated Pacific Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Bodie Mining District, Bodie, Mono County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the Thirteenth day of March, 1880, an assessment (No. 1), of One Dollar per share was levied upon the capital stock of the corporation, payable immediately in lawful money of the United States, to the Secretary, at the office of the Company, 330 Pine st., room 5, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Sixteenth day of April, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Saturday, the Eighth day of May, 1880, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors. F. E LUTY, Secretary.

Office—No. 330 Pine street, room 5, San Francisco, Cal.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given that at a meeting of the Directors held on the Eighth day of March, 1880, an assessment (No. 41) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twelfth day of April, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the Third day of May, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office—402 Front street, room 8, San Francisco, California.

Rocky Point Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment (No. 2) levied on the 14th day of January, 1880, the several amounts set opposite the names of the respective shareholders, as follows:

Rotary Pulverizer,

(WHITE'S IMPROVED,)

For Disintegrating Ores and Other Substances.

GUARANTEED TO BE EQUAL IN CAPACITY TO A

HUNDRED STAMP BATTERY!

IS FITTED UP WITH

Homogeneous Steel Beater Bars.

Found to be more durable than either Hard Steel or Soft Iron. Dry-crushing the hardest rock; will last for months, and without the slightest danger of breakage.

The Pulverizer requires about one-third the power usually expended for the reduction of the same amount of Ore by Stamps.

Price List, Etc., of the White Rotary Pulverizer.

No.	Tons Per Hour.	Inches Diameter.	Revolutions Per Minute.	Horse Power Required.	Shipping Weight.	Lumber Required.	Price.
1	6	56	600	40	12	6,000 ft.	$5,000
2	10	72	470	60	15	9,000 "	8,000
3	16	84	400	75	20	12,000 "	10,000

The Repairs on the Pulverizer will not exceed those of a 10-Stamp Battery.

The Shipping Weight of the entire apparatus is not one-eighth of that of Stamp-Mortars required to do an equal amount of work. It can be placed and put running at the Mill in from fifteen to twenty days.

Address GEO. W. WHITE, Inventor.

Manufactured exclusively at the ÆTNA IRON WORKS, 217 Fremont St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, APRIL 17, 1880.

VOLUME XL Number 16.

California Shipping Copper to the East.

We saw, a day or two since, about 16 tons of ingot copper, 98 fine, which was awaiting shipment to the Eastern refineries. It was produced at the mine of the S. F. copper mining company, which is situated in Nevada county, Cal., on a branch of the C. P. R. R., 12 miles from Wheatland.

During 1879, the mine turned out 6,000 tons of copper similar to the above, and also 512,128 pounds cement, or precipitate copper. The capacity of the work is 60 tons per day.

This is only one of the productive copper mines upon this coast. There are others which are producing copper for shipment. There are hundreds of copper mines that are not worked, but which would be if refineries were established, where the ore could be readily received, or the mats of copper find purchasers.

Here is one of a great many industries that are lying dormant and unproductive among us because there are no facilities for rendering their products marketable. In this case, the copper has to be shipped to the Eastern States in sailing vessels, costing no small item for transportation from the mines to the seaboard, and shipment thence to the Atlantic or European ports, there to be refined, rolled into sheets, bars and rods, made into rivets, bolts and nails, and reshipped back to our own doors, and, in some of its forms, taken back to the very mines which produced the copper, to be used there. All the time occupied in the double transit is so much time lost, is so much of a burthen that the mines must bear, to which must be added the cost entailed by the transportation. This is a heavy though indirect tax upon this great industry.

The PRESS was the first paper published on this coast to call attention to the necessity of having rolling mills and refineries established here to aid in the development of new mines. It demonstrated the fact that it would not only be better for the money expended in transportation, refining, rolling, and manufacturing the copper produced here, retained and paid out among our own laborers. It proved that there would be a fair margin of profit to those who might invest in the establishment of such works here, provided the present producing mines kept at work and new ones were opened. It also proved, what is necessary to ascertain before embarking in the enterprise, that ample supplies of copper can be obtained here, and, with the renewed facilities that such works would afford for rendering the copper marketable, there would be an inducement and an incitive for the now dormant mines to spring into renewed activity. It would also have the tendency to open new mines, and, by its genial influence, render our copper exports an item of great value.

We are pleased to learn that the matter is being agitated in monied circles, and that capital is now ready for the starting of such an operation as soon as the requisite talent and practical experience can be obtained to supervise the erection of suitable buildings, and the construction of the needed furnaces and machinery, combined with the requisite skill for conducting the manipulations of the crude material, which consist of ores, matte ingots and precipitats, until the refined copper is produced.

With the commencement of the operations of a capacious refinery and rolling works, would dawn upon the copper mining interest a brilliant epoch. Activity and enterprise would be awakened, and labor find a new and extensive field for its employment. We hope in the near future to be able to give definite information of the initiative steps having been taken in this direction.

TOMBSTONE district, Arizona, is now shipping from $5,000 to $8,000 worth of bullion per day, and it is expected that it will reach $10,000 per day as soon as the new mills get in thorough working order. Last week $52,000 was received in Tucson from Tombstone district.

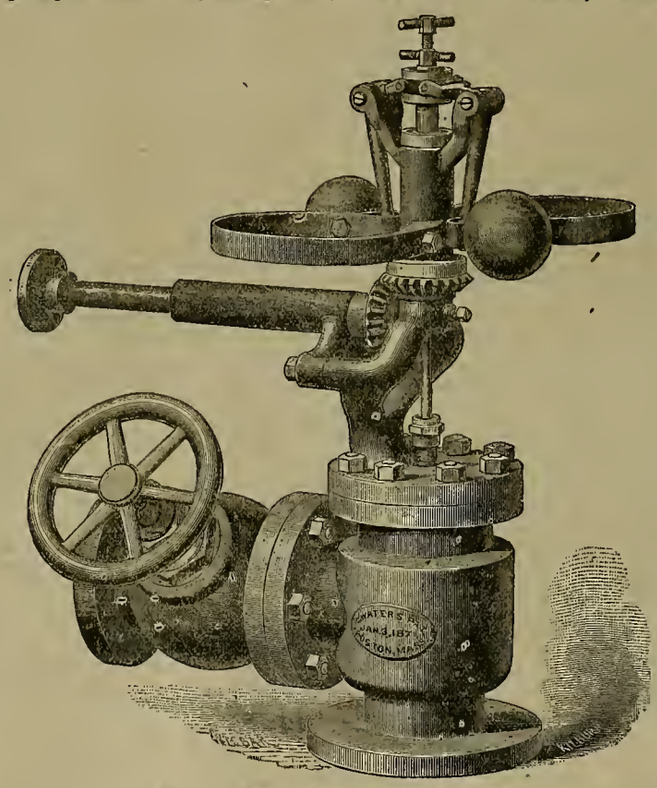
A REVENUE cutter is to be fitted out immediately to go to the relief of the exploring ship *Jeannette* and the whaling vessels, supposed to be frozen-in somewhere this side of Wrangel Land.

The Hydraulic and Drift Mines.

The recent advent of warm weather having cleared the ditches of the snow and ice, that had so long obstructed them, gravel washing has been started up along the entire hydraulic belt, or, at least, as far north as Brandy City, at which locality piping is in active progress. The incoming season will, it is thought, be a prosperous one with this class of miners, notwithstanding the months of February and March have this year been wholly lost to them. This loss, it is hoped, will be in good part made up through an abundance of water and the excellent condition in which the miners had placed their claims prior to the coming of the winter rains. Never before had this preparatory sort of work been done with such thoroughness as during the past autumn, to say nothing of the advance that this branch of mining has every year made through the introduction of improved gravel-washing and gold-saving appliances, the gains secured thereby amounting of late years to 10% or 15% annually. Not only have greater efficiency and economy in the working of the gravel been secured, but almost equal benefits have of late accrued to the hydraulic miner through the employment of machine drills for driving the long bedrock tunnels, so often required for opening up his claims. Then, too, the productive capabilities of this class of mines have, through increased water supplies, met with steady and material enlargement.

Wherever we look along the path of this industry, as it leads from Placer across Nevada into Sierra county, these evidences of progress and improvement are noticeable. At Gold Run on the south, and Brandy City on the north, as well as at all intermediate points of importance, the effects of this onward movement are apparent. The Gold Run ditch and mining company have for ten consecutive years disbursed all their net earnings in betterments on their estate. After all these years of careful planning, persevering effort and large expenditure, this company has at last succeeded in so far perfecting their grand scheme of improvement as to have greatly increased the productive capacity of their property, which, when that system shall have reached final completion, will stand second to none in California as regards gross production, net revenues and intrinsic value. At Dutch Flat, Liberty Hill and You Bet, and further on at Blue Tent, Brandy City and North Bloomfield, a like purpose is being worked out through the improvements undertaken and now being prosecuted by the several companies owning mines, ditches, etc., at these places.

Drift mining along this belt is being actively and successfully carried on at Gold Run, at Liberty Hill, at various localities on Chalk Bluff ridge, about Moore's Flat, at Allegheny, Forest City, and along Slate Creek, and also to a greater or less extent at many intermediate points. At Liberty Hill and Chalk Bluff drift mining will be especially active this season, the rich strikes that are constantly occurring at these localities tending to encourage prospecting and greatly promote this branch of mining.



THE WATERS "PERFECT" GOVERNOR.

DECOMPOSING THE ELEMENTS.—That eminent physicist, Raoul Pictet, who a year or two ago first liquified and then solidified the subtle hydrogen gas into shining metallic specks, has conceived the idea of decomposing some of those chemical elements which chemists have for a long time thought to be compound. Pictet proposes to begin with bromine, and he will use heat as the decomposing agent. As the heat of the electric current, which scarcely reaches 7,000 degrees is insufficient, he proposes to use solar heat. This he will accomplish by employing a number of concave mirrors, each having an area of one square meter. Enough of these mirrors will be used to attain a temperature of 20,000 degrees. The gaseous products will be drawn through a lime tube surrounded by a freezing mixture of 350° temperature. This will prevent the component parts from again combining chemically, should bromine prove to be a compound substance instead of an element.

The Waters Governor.

We illustrate herewith the "Waters Perfect Governor," for which Parke & Lacy, Nos. 21 and 23 Fremont street, in this city, are agents for the Pacific coast. The governor is supported on a frame of novel design which also closes the opening in upper end of valve chamber. The peculiar shape of this frame admits of easy access to stuffing-box, bolts, etc., even in the smallest sizes. Into this frame is fastened by a set screw a stud, which supports the casting composing the governor proper, and which is made to revolve around the stud. This casting is provided at top with proper care to receive the joints of the arms which revolve with it, and at the lower end with two projections to which are bolted one end of a steel spring. The free end of this spring is formed into a slot, and also of such shape as to receive the ball, which is secured to the spring by bolts. One end of the arm is formed into a small ball, and fits loosely into the slot of spring; the other end of arm carries a piece of hardened steel which works in a grooved composition collar, fitted to move up and down in the central stud. The valve stem is screwed through this collar, and communicates motion directly to the valve. The balls being supported and rotated by the springs, all friction is taken off the joints of arms, and the balls do not rise and fall by the rotation of the arm around its pivot, the slot in spring compensating for all difference in motion. The end of the valve stem is extended through the top of composition collar, and furnished with a handle, with which to turn it, and a check nut to hold it in place. Screwing this stem down causes the engine to run slower; screwing it up causes it to run faster. The check nut holds it wherever wanted. The bearing of horizontal shaft is bolted to the frame, and if broken off by accident, can be easily and cheaply replaced without damage to other parts of the governor. All bearings are made of babbitt metal, and all parts are duplicate.

The theory embodied in the construction of this valve is, to relieve the joints of the ball arms or levers from all friction, and also the weight of the ball; to have the balls always revolve in the same plane without rising or falling, the force usually supplied by gravity being furnished by springs, which also sustain the weight of the balls. Having a valve of large area insures the highest economy consistent with the use of plain engines, and also the nearest to perfection in regulating; the use of comparatively light balls, springs, and a medium high speed, all tend to correct results in regulation, especially if combined with large valves. The valves are, practically, indestructible. Being made of composition, they will neither rust nor corrode, and they are claimed to be proof against the action of what is called steam-cut, which quickly renders a governor worse than useless. The ready means of adjusting the speed of the engine is another great convenience, the range of variation being as high as seventy-five per cent. This governor is especially adapted to very small engines also. Being unusually quick in its action, it is remarkably adapted to sawmills, rolling-mills, and all places where the changes are sudden and severe. It is claimed that with this governor an engine can be made to do its work with very low boiler pressure, as the large opening to the valves does not throttle the steam in time of need, and it enters the cylinder nearly at boiler pressure.

WE see by the Nevada City *Transcript* that quartz prospectors have been more successful in that district for six months past, than during any previous winter for several years. A number of miners who have hitherto confined all their attention to explorations in gravel have forsaken that business and begun looking for ore deposits with encouraging results. Several of the newly discovered properties are being negotiated for by capitalists and agents now stopping in the city, and with every prospect of bargains being effected soon.

PETITIONS against the proposed new mining laws are being circulated in many of the mining districts of this and adjoining States and Territories.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Side Lines of Mining Claims.

Editors Press:—The eubject of broad or narrow eide lines, involvee a qnestion of vast importance to mining interests, that should have been settled long ago. There are many opinions on this qnestion, but I now think ninety per cent. of the facts and arguments are on the side of broad side lines. That I have not alwaye thought so, and have gradually been forced to thie conclueion from facts in the actual development of mines, satisfies me the more that I am right. I will briefly state the only reasons used to advocate narrow side lines. They are, first, that when a patent is obtained, you pay for a minimum number of acres, and they are all you need. Second, that with the full side linee allowed by the law of May 10, 1872, to-wit, 300 feet on each side from the center of the lode, a few claims cover a whole district. These two reasons embrace all that can be said, of any force, in favor of the one hundred-foot side lines etill claimed in perhaps a majority of the districts.

Now, the facts against the above reasons are, first, the narrow side linee seldom embrace the croppings of the vein, if a large one, hardly ever when it lies along the trend or face of a mountain, and never, when it crope along the backbone of a sharp ridge.

I now speak of lodes in northern Utah, at elevations of from 6,000 to 10,000 feet. In these cases, the croppings shoot out to the surface through the broken debris that covers the mountain side, sometimes in nearly horizontal lines, making their appearance on the surface hundrede of feet from the main lode. Suppose several of these have been taken up; a conflict of title ensues; the purchaser must buy them all to dispel the clond on the title. The miner wants enough side line to cover all the croppinge of hie vein, so that he may have the benefit of all the title to his lode. The law of May 10, 1872, is good enough. I would amend it in this only: make it compulsory, and prohibit the districts from cutting down the side lines. This is in the true intereets of the miner and capitalist alike.

"Why, then, do eo many districts reduce the side lines to a minimum?"

For the eelfish reason that, when a rich lode has been found, the wish to get as near as poeeible—in the hope that a cropping, parallel lode, feeder or spur may be obtained, to get a elice of the purchase money when a title is eought for. The true miner and prospector seldom takee advantage of the situation. The command, however, "Thou shalt not covet," is hard to obey. The class of men who will kick against the broad side lines of the *coyote* miners—chaps who sit out on the hillsides, with a bottle of whiskey, and howl for a piece of any man'e claim, through any adventitious circumstance, except to work or pay for it. Much more may be said on this subject if a discussion ensues.

"49er."

Siskiyou Items.

Editors Press:—On the night of the 30th of March, after a nice snow of about two inches, it commenced raining—the first rain since the 4th of Decemher—aud up to date it is still raining by epells—an "Oregon mist." The ground is thawed out and muddy. The lowlands are wet, and our crope are all late thie eeason. We have just passed through the hardest, coldest and longest winter known in this county for the last 20 years, eo old residents inform me. The snow on all the mountain ranges is deep. This makes the miner rejoice. A large amount of enow implies plenty of water; water means an ahnndance of work; work pays well usually; lots of "filthy lucre" taken out of the bosom of old Mother Earth insures better times. We look for a prosperous year. All the mines report well so far, Salmon river, Klamath, Black Bear, Scott's Bar, Sawyer'e Bar, Oro Fino, Muggineville, Quartz Valley, South Fork, French creek and in fact from all parts of the county comes a good report. Cory & Kingery, on French creek, report the ledge looking well and plenty of rich rock in sight, heside a good supply out. I hear that there is a good prospect of theee mines changing hands, possibly this month, one at $30,000, the other at $75,000. Hartstrand will resume work as soon as he gets his crops in, as will also Root and others. Roberts is running the Welsh placer mine. Nelson ie piping on Miners' creek. Jim Connor hae a good prospect in hie quartz.

Our towns are all improving. Of our county seat, Yreka, I can say but little, not having been there since last fall, but I hear of several business changes and improvements.

Fort Jones ie improving. Several nice, aubatantial buildings have been lately erected, and quite an increase in the population goes to show that that vicinity is prospering.

Etna has inaugurated several changes. The oldest atore, that of Denny & Brown, was lately eold, lot, buildings, stock of goods, etc. The new owners propose erecting a two-story brick building this eummer. The old Diggles stand, owned hy Alex. Parker is to be moved and a brick put in its place.

It is said we are to have a fine brick blacksmith shop by Ames & Johnson. Several neat cottages are under headway. J. O. Welsh, our photographer, informs me he contemplates erecting a two-etory building, the lower etory for a store, the upper one for a gallery.

Callaghan'e Ranch has had the honor of erecting quite a number of neat residences, and now Albert Denny is building a stone edifice to be ueed for a etore.

The farmers, not be left in the background, are improving their farms. I hardly know of a farm that oannot boast of eome new buildings, fences, addition of land, stock, or in some way showing that they are prospering. A few farms are changing hands, not many; and those few at good round prices. The farmer is now getting good prices for all his produce. I gave 90 cents per bushel for wheat April 3d. Barley rangos at $1.25 to $1.50 per 100 pounds; oats at $1 to $1.50; potatoes, 1½ to 2 cents; beans, 6 to 8 cents; hay, $15 to $20 here, $40 to $45 in Yreka, etc. Now, at these prices with fair crops, ought we complain? It is true we are snowed in almost every winter—that is, the roads sonth are closed for freight teams, and sometimes only eleighe can pass for several months, but we can go to any of the towns in the county, and we usually enjoy good health. Our lands produce well, etock does well, and we handle money, if we don't save much of it. Well, I tire your patience, so for the present.

R. D. Nunnally.

The Proposed Mining Law.

Editors Press:—I see, from the provisions of the bill introduced into Congress by Mr. Converse to provide for the survey and disposal of the public lands of the United States, that some of the most sweeping and radical changes are proposed as to the manner of locating mining claims, as to the application for patents to the eame, and as to the manner of contesting rights to mining claims.

It seems to me, Messre. Editors, that either the attention of the people of the Pacific coast has not been sufficiently aroused and called to these proposed changes, or else that they are marvelously lethargic and indifferent to their rights and interests. If they were sufficiently aroused and awake to the ruinous effects of the bill of Mr. Converse, if enacted into a law, they would be holding indignation meetings all over the coast. There are many features of this bill which are very objectionable to me, and some of which I propose to notice through your journal, if you will publish my communications or articlee.

The first moet radical change I desire to notice, is that proposed in Section 169 of the hill, whereby it is proposed that all mining olaime located after a certain day in this year, "ehall be bounded, as to surface, by etraight lines, and all right to minerals contained therein ehall be confined within vertical planes passing downward through said straight boundary lines." This provision, if it becomes a law, will, without any donbt as to all mining claims located after its enactment, cut off the right of the locator or owner to follow his ledge or vein on its dip outside of the eurface boundaries of his claim, or outside of the "vertical planes passing downward throngh said etraight (or surface) boundary lines." Under the law as it now is (see Section 2320 of the U. S. Revised Statutes), no location of a mining claim can be made until the discovery of the vein or lode within the limits of the claim located, and the vein or lode must be in the center of the claim, for the statute says, "no olaim shall extend more than 300 feet on each side of the middle of the vein at the surface." Under the bill of Mr. Converse, there is no such provision as this, as I understand it, but the locator can locate his ledge or vein, either in the center of his claim or on one side of it, as he may choose. Now to illustrate one of the effects of the operation of this feature of hie bill, suppose that "A" should make a location of a mining claim, believing from the eurface indications that his ledge dipped to the west (as was the case at first with the Ophir or Comstock ledge in the Virginia mining district, Nevada), and, therefore, with a view of covering the ledge as much ae possible on its dip, should make his location mostly to the west of the croppings of his ledge, and after some little development "B" should come along and see that the ledge was dipping to the east and should locate the eurface ground for a ledge to the east of "A's" claim, will it not readily be seen that "B" would take "A's" ledge so eoon as it dipped outside of the snrface boundary and into or under "B's" surface ground? And this might happen within a few feet from the surface, for "A" might he mistaken as to the dip of his ledge at the enrface, whereas, after getting down a short distance from the anrface, he might find hia ledge dipping in just an opposite direction to what he supposed when he located it. Is it intended by the bill to work any such injustice and wrong as this? That it will do so there can be no doubt.

A mining corporation, which may have expended large amounts of money in prospecting and opening up ite claim, under auch a law as this bill proposes, might, just at the time it reaches the pay portion of its ledge and thinks it is going to reap the fruits of its large expenditures and great efforts, faith and perseverance, awake to a knowledge of the fact that it has no mine or ledge, but that some one else owns what it purchased or located and always supposed rightly helonged to it—that some one else owned the pay portion of the ledge it located or purchased and has alwaye worked since its location. Would this not discourage prospecting? Would it not discourage, in a great degree at least, mining as an industry? We do not like to expend our money and work that others may enjoy it *only*. It is the hope and expectation that we will come into the enjoyment and possession of the fruits of our own lahor that stimulates and nerves us to endurance, hardships and risks. Take this hope and expectation away from us, and we cease to try and will refuse to risk. Faith, hope and expectation are the levers which move the mining world. And yet it is eeriously proposed in Congress to take these elements away from the miner, the prospector and locator, by cutting off his right to follow his ledge, and thereby to deprive him of the fruits of his lahors, faith, hope, pereeverance and industry. Who would risk anything under such a law? It would utterly paralyze mining and prospecting for mines.

There is another feature of this bill, which, if it ehould become a law, will be more paralyzing and destructive to the miuing industry and prospecting for the mines, than the one noticed.

By the fourth subdivision of Section 174 of the hill, the locator, his assigns or his duly authorized agent, is required to make, under oath, an application in the propsr land office for a patent to his mining claim. This is required to be done within one year after the approval by the Surveyor-General of his survey, and this approval, I understand from the third subdivision of the same eection, must be made or given within 90 days from the posting of the notice of location. This has reference to all claims located after the passage of the bill. As to those claims located prior to the passage of the hill we will notice further on. It will be further noticed or observed that if the owner of a mining claim does not make application for a patent within the time required hy the bill, it will he forfeited and become subjsct to relocation, for this fourth subdivision says, "within one year from the approval, by the United Statee Surveyor-General, of said survey, the locator, his assigns or his duly authorized agent, (who) has or have complied with the terms of this chapter, shall file in the proper land office an application for pateut under oath," etc; and Section 177 expressly declares, "that failure of the claimant to make proof of work aud payment, within the time, herein hefore prescribed, shall work a complete forfeituro of the claim, and the survey theretofore made ehall he canceled." These two sections make it clear and indisputable that the owners of mining claims located under the bill enacted into a law, must apply for a patent thereto, within one year from the date of the approval, by the United States Surveyor-General, of the survey of the claim, or within 15 months from the location of the claim, or in case of failure to eo do, said claim will be and become "completely forfeited."

Now, in order or to enable the locator of a claim to make application for a patent, he ie required to show that he has paid the $50 required hy the third subdivision of this section, and that he has expended as much as $500 in labor and improvements on his claim, as required by the fourth subdivision. This makes $550. Now to this we must add the Government price of the mining ground, say, 22 acres at $5 per acre, the price of mineral land under the law as it now exists, and we have $110 more to he added to the $550, or $660. To thie we shall he compelled to add $100 more at least for attorney'e fees, in making the application and procuring the patent, making the sum of $760. This is the lowest figure at which he could patent his claim, if the Government surveyed his claim for him, but I understand from Section 187, that the expense of eurveying claims shall he paid by the applicants. The expense of the eurvey of his claim will run all the way from $100 to $250 or $300, owing to the dietance the claim is from where the Deputy United States Mineral Surveyor lives, and to the expense of getting to and from the claim and the time and assistance required in making the eurvey. Say then that his eurvey will cost him $200, and we have $960, which he will be compelled to pay for his patent, and all of this within 15 months from the date of bis location. When you take into the account cost of abstract of title, notarial fees and the necessary cost of the applicant in traveling to and from the county seat of his county, where he must go to get his eurveyor and see his attorney, I venture the assertion that $1,000 will not more than pay all the expense necessarily incurred by the applicant in procuring or getting his patent, and this, it must he borne in mind, he will be compelled to pay within 15 months from the date of his location. What becomes of your poor prospector under such a law? Will the poor prospector or miuer care to prospect for mines when he knows that he never can perfect a title to his mine? Your "Prospect Bills," "Old Virginias," "Comstocks," "O'Reileys," and other prospectors will be no more if this proposed bill becomes a law. The idea of compelling a person to apply for a patent to his mining claim within any time is all wrong anyway. The law ae it now is, compelling him to do $100 worth of work on his claim, if located after the 10th of May, A. D. 1872, or $10 for each 100 feet, if located prior to that date, is a efficient coercive towards inducing owners of mining claims to apply for patents to their claims. This compelling owners of mining claims to apply for patents within a certain time was what made the so-called "Negley Amendment," so obnoxious and objectionable to the people of this Virginia mining district. The proposed bill proposee to extend the principle of the "Negley Amendment" to all the mineral lands of the Unitéd States, except in certain States excepted from the operations of the bill. As proposed in the "Negley Amendment," it only applied to the mining claims within 2,000 feet on either side of the Sutro tunnel, and the time within which the application for patent was to be made, was eix months from the passage of the bill. The mineral lands of the United Statee should be not only open and free to appropriation, occupation, or possession and development by citizene of the United States, but no obstructions should be placed in the way and no unnecessary burdene ehould be impoeed upon such citizens by legislation in reference to such lands. To require them to apply for patents would not only be placing obstructione in the way and imposing heavy and unnecessary burdens upon the mining industry of the country, hut it will almost put an end to the further development of new mines. It will discourage and almost terminate prospecting for mines. This is a hard rule, and nine-tenths, and possibly 99 out of 100 of the claime located under the bill if it becomes a law, will lapse—will be forfeited. Indeed, but few new claime will be located after it becomes a law.

But will this bill, if it becomes, a law, compel owners of mining claims, located prior to the passage of the law, to apply for patents to their claims under this law? I say it will. Section 190 of the bill says: "That all rights which havo attached to mining claims, under previous acte of Congress, shall not be affected by the operations of thie chapter: Provided, That where such claims have not been, or ehall not, within one year thereafter, he consummated by the required payment of purchase money, such unconsummated claims shall lapse, and the land embraced therein shall thereafter he subject only to the operations of this chapter." It is my opinion that the proviso to the above section will compel all owners of mining claims, whether located under previous acts of Congress or under this bill enacted into a law, to apply for patents to their claims. It is true that the beginning of this section saye, "that all rights which have attached to miuing claims, under the previous acts of Congress, ehall not he affected by the operations of thie chapter;" and hy reason of this language and the construction placed upon the proviso itself, I have heard it said that it is not the purposo of the proviso to compel the application for a pateut. The construction placed on the provizo hy those taking this view of the object and purposo of the eection is this: They say, that whilst it is not intended by this proviso to compel the application for a patent, yet it is intended to compel the owners of mining claims to pay the Government for them, that such owners might, by depositing the Government price of their claims in the local land office, take no other or further steps towards perfecting their claims until it suited their convenience and pleasure. It will not, I suppose, be contended by any one that a title can he obtaioed under the proviso or the bill enacted into a law without the owner making his application to the Government therefor. It ie only contended that the owners of mining claims under this proviso may simply pay the Government price of his claim iuto the local land office, there to await the final perfecting or consummating of his title by applying for and obtaining his patent. Now admitting that the above construction of this proviso is correct, yet when you compel the miner to pay the Government for hie claim, or lose it, you compel him to perform or discharge one of the burdene in applying for a patent. It is doubtless true that if the payment iuto the local land office of the Government price of his land or claim is all that is required by this proviso of the owner of a mining claim, he would be relieved of some of the burdene of the proviso, supposing it to require the owner to apply for a patent, and to do all those things required by the bill, in order to obtain a patent; yet even this would be an unnecessary burden imposed on the owner of a mining claim, for the roaeon that it would frequently require him to pay for his claim before he has sufficiently developed it to determine whether it is of any value or not; and for the further reason that it would frequently require him to pay the Government price of his claim when he would be least able to do so. But is this construction of the proviso right? Is it maintainable? Is it the proper construction to be placed on that proviso? I say not. In construing all statutes or conetitutional provisions we are to ascertain, if we can, the intention of the Legislature which passed the the law or the convention which framed the constitution. This intention is to he ascertained, first, if we can, from the language of the statute or Constitutional provision; second, from the context; third, the apirit and object of the law; and fourth, from the surrounding circumstances and conditions of the country under which the law is enacted or the provisions framed. The language of the proviso is that "where auch claims (that is, those claims located under previous acts of Congress) have

MECHANICAL PROGRESS.

Blistering of Paint and Varnish.

Many are the opinions expressed regarding blistering, and although some very sensible theories are advanced, we are inclined to believe that the bottom of the subject has never been reached. We hold an opinion of the cause of this trouble, and it may be that this opinion has been forestalled by others, but as we have never seen the points laid down in print, we present them here.

Blistering of a varnished surface after the varnish has had proper time to harden is due to the evaporation of moisture which lies confined under the shell of varnish. This evaporation is caused by heat, and it is seldom, if ever, a blister will rise upon a varnished surface without the temperature is raised to an extreme degree, near to that which the varnish received in its manufacture.

The accumulation of moisture *under* the varnish may be brought about in several ways, the most particular one being in the closing in of moisture in the rough stuff. During the rubbing of the rough stuff the water used is partly absorbed, and unless due care is taken to give ample time for "drying out" before the application of subsequent coats, a great amount of moisture will be confined within the cells of the rough stuff.

Boiled oil contains moisture, as of water, and in cases where steam is used to express the oil from the seed this percentage is increased. Turpentine, an extremely volatile liquid, also forms an evaporating substance which is rendered active by a slight heat, and in its haste to reach the air it disturbs the outer surface, either lifting an elastic coating into bubbles or blisters, or bursting open a hard and inelastic one into cracks.

The primary cause, then, of blistering is moisture, either in the form of wet moisture or of evaporating liquids, such as turpentine. The wood may be unseasoned, or it may have been wetted in the course of preparation, such as steaming to bend, etc. The rough stuff water may have been applied before the evaporation of liquids had taken place, either of which would bring about disastrous results.

"Dry blistering" is simply the hasty absorption of the liquids from outer coats by putty or paint which is expressly porous, depriving the coating of the requisite amount of binding and adhesiveness.

To prevent blistering, close up every lurking place for moisture by the use of the A B C system of painting, which will be found to be as easily done as repeating the alphabet. Be careful to have each coat dry before applying another, and you may laugh at the trouble which some of the craft call "deviltries."—*Coach Painter.*

On Drills and Drilling.

The attention of many professional men and others interested in mechanical operations has for a lengthened period been directed to this subject. As must be well known, there are a great many descriptions of drills now in use—some good, some indifferent. The American twist-drills are now sold in large quantities, and for some purposes answer exceedingly well; but at the same time there are points to be reckoned against them. Firstly, it is very difficult to grind both edges at the same angle, and if this is not done, the result will be that the hole will not be the true size of the drill used; this will deceive a workman, and may probably spoil good work. And another objection to them is, that when the drill is about to come through the hole being bored, the quick twist causes it to worm through at such a speed that, in many cases, the drill is either broken, or the work forced up to the end of the twist, thus spoiling what might otherwise have been a smooth hole. We consider that the best description now in use is the straight-fluted drill, which was originally introduced by a Mr. Martin, of Charlton; but this gentleman having for some long time ceased to make them, there arose a difficulty in procuring them. They are now, however, to be had more readily, and a set of these drills should certainly be found amongst the tools in every workship.

With all the improvements that have from time to time been introduced in the various drills, in most factories, we have frequently noticed, that except for very large work, every workman prefers to make his own drills, and from personal experience we have found no better drills than those thus made, to do which is a simple process. For example, a drill-chuck being fitted to the lathe, with a round hole one-fourth inch in diameter, and a fixing-screw; have always at hand a bar of round cast steel of the correct diameter, to fit the hole, and cut off a length as required. If the drill is to be made of a large diameter, it must be flattened out at the forge to the desired size, and then finished with a file. Most workmen, nowadays, simply forge their drills and grind them into shape; this answers every purpose for work that does not require any finish, all that is necessary is that the tool should run pretty true in the lathe and cut well. In boring a hole in thin work it becomes necessary to make it flat at the bottom. To do this a small half-round bit placed in the same chuck answers the purpose. This is essential where the hole has to be topped, as it allows of one or two more threads being made by the top. If the drill is required to be smaller in diameter than the steel from which it is made, it is a simple matter to turn down the end and then file it flat on both sides, to the same shape as the larger one previously mentioned. A great point with regard to drilling is the hardening of the drills. * * * In using all drills for boring a hole between the centers of the lathe, it is a most essential thing to let the work turn round occasionally in the hand. A certain way of boring a true hole of large diameter, say three-fourth to one inch, is to fix in the chuck a well-made cylinder-bit, and carefully fix the work on the saddle of a self-acting lathe, and place on the change-wheel used for a fine finishing cut. * * * For very small work the bow drill is a most useful tool. Bows are made in many ways, and from different materials. Those for sale are of steel, with a hook at the end, over which a thin catgut is looped, with another hook near the handle, and to alter the tension a small toothed wheel with a detent is used. * * The Archimedian drill is also used for many small pieces of work. This is made from pinion-wire carefully twisted into the form of a very quick screw; and to tap the nut for it a similar short piece must be made and the end tapered off to the bottom as if it were of the thread. This done a hole must be drilled in the piece of metal that is to form the nut, and the tap, as we will call it, be driven through it. This will form a corresponding screw for the long one to work in. * * * To know how such a thread is put into a piece of metal may be of service for other purposes.—*Forge and Lathe.*

Structural Changes in Wrought Iron—Bridge Accidents.

A correspondent of the *Railway Age* writes, in regard to a change in the tensile strength of iron, as follows: I have collected and sent to you some iron bolts, links, etc., that have been in use a long time (I wish I knew how long); they are broken short off and exhibit in the fracture all the appearance of cast iron, showing that even the very best wrought iron, such as is selected for links and link-pins, undergoes a radical change in structure by long usage in a continuous state of vibration, which seems to be violent enough to rupture the fibers of the iron and to totally destroy their continuity. Now I have reason to believe as the result of observation, that the metal of an iron bridge is subjected to a continual and almost uninterrupted succession of concussions while in a state of extreme tension, precisely similar in effect to those sustained by a link which connects a long freight train with the engine. Lateral jerks, without tension, seem to produce the same effect upon the large vertical bolts which connect the body of the car with the truck.

When you look at these specimens you will think I have had some cast-iron bolts made and boxed them up for you, for I believe they can all be broken short off with a sledge. One of them I saw broken myself, opposite the depot with a sledge to detach it from the draw head. It was intended only to loosen the bolt, but it broke like a pipe stem. This bolt or pin of iron from appearances, had been in constant use for 10 years.

It is a singular fact that in the conclusion reached by committees of investigation in bridge accidents, no thought of a possible deterioration in *the tensile strength of the iron*, ever enters their minds. The verdict is, universally, that the plan of the bridge was perfect, and the cause of ite fall involved in mystery. They never seem to suspect that the bridge fell because it was too weak to stand, although it would appear to be palpable fact. How strange that it never occurs to them that, however strong the bridge was originally, so strong as to bear twice the weight that broke it down, its strength must have been impaired or it would never have failed to sustain the usual weight.

It will be acknowledged before long that all iron truss framed bridges are every year impaired in tensile strength, and that their sudden fall is inevitable, especially with the heavy loaded cars now in use.

HEAVY LOCOMOTIVES.—The tendency at this time seems to be to increase the weight and draft of railroad locomotives, and to decrease the weight of care in proportion to the load which they are designed to carry. The Pennsylvania Railroad Company are now building at their shops in Altoona a new fast passenger engine, to run between Philadelphia and New York. It will have drivers five feet eight inches in diameter. If it works satisfactorily nine more of them will be immediately constructed for the same road. They are also building 60 locomotives of the Modoc pattern, recently described in these columns—the heaviest ever built. The engineers do not like these heavy engines, but the company appears well satisfied with their pulling capacity.

WELDING TUBES AND TIRES.—Herr Krupp, of Essen, has recently patented in Germany a method of welding tubes and tires, which is based upon an excellent idea. He draws the tube over one of a pair of ordinary rolls, and then heats the whole length of the portions to be welded by a special contrivance, which is a portable fire-box, into which air is so blown that the heat is directed against the weld. After the necessary heat is attained the rolls are set in motion and the place to be welded is repeatedly drawn through them.

SCIENTIFIC PROGRESS.

Cold Light.

There are many operations connected with industrial pursuits in which the employment of artificial light is an absolute necessity, and there are conditions under which such light, if deprived of its dangerous attribute, heat, would prove of inestimable value. Amongst the many purposes for which such a light might be advantageously utilized, we have only to mention the working in mines, in powder magazines, and in ships' holds, stores, and other smaller compartments. Many attempts to produce such a light have been made from time to time, and to a certain limited extent some have succeeded, although hardly in a practical sense. In 1864, Geissler's tubes were introduced for this purpose into several French collieries, with some success, the battery arrangements being modified to suit the intended purpose. Since then we have had several attempts to produce what we may term a "cold light" by means of agents possessing phosphorescent powers. Amongst others, Mr. W. H. Balmain has succeeded in producing a compound which in some points resembles paint, and inasmuch as it becomes highly luminous in the dark, it has received the name of "luminous paint."

With regard to the composition of this paint we can only say that its components are chiefly lime and sulphur, the remarkable results of their combination being the effect of special manipulation. We know that the sulphides of lime and baryta and some kinds of marine shells become luminous in the dark after having been exposed to the daylight for a short time. It was precisely on these lines that Mr. Balmain worked, and he succeeded in producing a compound which can be painted over any surfaces, and which, after exposure to light for a few minutes, becomes highly luminous when taken into a darkened apartment. It will retain its luminosity for about six hours, after which it must be again exposed to the light in order that it may absorb a fresh supply of rays to be afterwards usefully given off in darkness.

The precise nature of the luminous ingredients are not known to us, but they are stated to be produced from the chalk of our cliffs. Whatever they may be they are simply compounded with the usual carriers of ordinary paints, and are similarly applied. We recently had the opportunity of inspecting a number of articles prepared with this paint, which after having been exposed to daylight for a few minutes, gave forth in a darkened room a beautiful soft violet light, sufficient in some cases to enable any object in the apartment to be clearly distinguished. Should it be necessary to revivify the luminous object at night, it can be done by burning a few inches of magnesium ribbon in front of it. The explanation of these phenomena, perhaps, is that the molecules of the sensitive salt are put into vibration by the waves of light impinging upon them, and that the vibration continues long after the motive light is withdrawn, an action being set up which affects the eye in the same way as the vibrations of a bell struck by a hammer affect the ear.

The applications of which this remarkable invention is susceptible are very numerous. Amongst other things we may mention its use on life-buoys, which are thus rendered useful at night, and for lighting up the lower compartments of ironclads. Divers will also find it useful in their sub-aqueous operations. In fact, a diver recently found it of great assistance to him in 27 feet of water in the Southampton Docks, his dress and head-gear having been coated with the luminous paint. As a means of affording light in a portable form the luminous paint is applied on sheets of glass of various sizes which have received the name of Aladdin's lamps, and which are in use on board some of our ironclads, and in the spirit vaults of some railways. In fine, we deem this invention to be one possessing great merit, and one, moreover, which can hardly fail to prove a practical success, inasmuch as it supplies the desideratum of cold light.—*Iron.*

Prehistoric Man.

S. B. T. Skertchly, at a late meeting of the British Association, as reported in *Nature*, gave evidences of the existence of man in East Anglia during the glacial period. Human implements occur in the beds underlying the chalky bowlder clay, equivalents of the middle glacial series of S. V. Wood, Jr., and F. W. Harmer, near Mildenhall, Warren Hill, Culford in Suffolk, West Stow in Suffolk, and Brandon. Near Brandon the same beds have been dug into beneath the bowlder clay, with the same results. These proved the existence of man in those districts previous to the glacial periods. W. Boyd Dawkins, in the ensuing discussion, said the glacial period should not be looked upon as a dividing line in classification. The same animals lived in Europe before and after this period, which could not be a hard and fast line. Upon applying this consideration to the question of the antiquity of man, there was no *a priori* reason for supposing that man was not here in the pre-glacial age. Seeing that animals were living in Europe before the cold period arrived at its maximum, it was probable that man was here too. Man was living in the south of this country when the area north of the Thames was submerged — when the sea there was bearing icebergs, which were accumulating the bowlder clay. Sir John Lubbock felt considerable difficulty in resisting the conclusions drawn by Mr. Skertchly. Prof. Huxley could not see the slightest reason for supposing that pre-glacial man was in any respect different from post-glacial man. The evidence Mr. Skertchly had brought forward was very satisfactory. At a later meeting of the Cambridge Philosophical Society, O. Fisher gave an account of two visits to the localities described by Mr. Skertchly. At first he was not convinced; but, on making a more thorough examination, as at Mildenhall and Bury St. Edmunds, he found Mr. Skertchly's views confirmed. That gentleman was present at the meeting, and showed a worked flint taken by his own hands from the loam underlying the chalky bowlder clay. Hence, the conclusions of the Association paper were confirmed by Fisher, an independent observer and at first a doubter of Skertchly's statement.

The Influence of the Electric Light upon Vegetation.

At a recent meeting of the Royal Society, of London, Dr. C. W. Siemens, F. R. S., gave a detailed description of some experiments upon the above subject which have been conducted during the last two months at his house at Sherwood, and exhibited specimens. The method pursued was to plant quick-growing seeds and plants, such as mustard, carrots, swedes, beans, cucumbers and melons, in pots, and these pots were divided into four groups, one of which was kept entirely in the dark, one was exposed to the influence of the electric light only, one to the influence of daylight only, and one to daylight and electric light in succession. The electric light was applied for six hours each evening, from 5 to 11, and the plants were then left in total darkness during the remainder of the night. The general result was that the plants kept entirely in the dark soon died; those exposed to the electric light only or to daylight only throve about equally; and those exposed to both day and electric light throve far better than either, the specimens of mustard and carrots exhibited to the society showing the difference in a very remarkable way.

Dr. Siemens only considers himself as yet on the threshold of the investigation, but thinks the experiments already made are sufficient to justify the following conclusions: 1. That electric light is efficacious in producing chlorophyl in the leaves of plants, and in promoting growth. 2. That an electric center of light equal to 1,400 candles placed at a distance of two meters from growing plants appeared to be equal in effect to average daylight at this season of the year; but that more economical effects can be obtained by more powerful light centers. 3. That the carbonic acid and nitrogenous compounds generated in diminutive quantities in the electric arc produce no sensible deleterious effects upon plants enclosed in the same space. 4. That plants do not appear to require a period of rest during the twenty-four hours of the day, but make increased and vigorous progress if subjected during daytime to sunlight and during the night to electric light. 5. That the radiation of heat from powerful electric arcs can be made available to counteract the effect of night frost, and is likely to promote the setting and ripening of fruit in the open air. 6. That while under the influence of electric light plants can sustain increased stove heat without collapsing, a circumstance favorable to forcing by electric light. 7. That the expense of electro-horticulture depends mainly upon the cost of mechanical energy, and is very moderate where natural sources of such energy, such as waterfalls, can be made available. The paper gave rise to a highly-interesting discussion, in which it was pointed out that the evidence afforded of the practical identity, as regards vegetation, of solar and electric light, besides the probability that it would be turned to immediate account by horticulturists, would afford great facilities for the scientific investigation of the influence exerted by light, as compared with other agencies, in promoting the formation of the active principles or most valuable constituents of plants, such as the quinine of the cinchona bark, the gluten of wheat and so forth. Before concluding his observations, Dr. Siemens placed a pot of budding tulips in the full brightness of an electric lamp in the meeting room, and in about forty minutes the buds had expanded into full bloom.

INFLUENCE OF SHAPE UPON ATTRACTION.—C. Lagrange refers to the following proposition, which he demonstrated two years ago: "When attraction varies inversely as the squares of the distance, if the distance is considerable, any mass acts with maximum, mean, and minimum energies, in three rectangular directions which are respectively the axes of minimum, mean, and maximum inertia." From this proposition he deduces the following results: "1. A mass of any form, at a certain definite distance from its center of inertia, acts with maximum, mean, and minimum energies, in three rectangular directions, which coincide respectively with the three axes of minimum, mean, and maximum inertia. 2. The relative positions of a point and of a material system, submitted to their mutual attraction, are determined by the stable axes of equilibrium in the system; the axes of minimum, mean, and maximum inertia are respectively axes of stable equilibrium, stable in one plane and unstable in a perpendicular plane, or unstable." The first of these deductions he regards as fundamental in the mechanical theory of crystallization.

Mining Share Market.

The mining share market, as usual, remains in a depressed condition. There has been no information forwarded from the mines to cause any change for the better, and without it there isn't likely to be any change. In fact unless a "bonanza" is uncovered in some of the stock mines before long, we do not see what is to be come of the market. With so many of the mining magnates and stock operators going off East, Pine street langnishes for an excitement of some kind, and those that remain do not seem able even to get up a fictitions one.

On the Comstock the main interest is at the north end. With the completion this week of the sump to the winze from the 2400 to the 2500 level of Union, preparations will be inaugurated for connecting that winze with the Union shaft. The *News* says it is a fact that of late no striko in Belcher is so satisfactorily successful as an oyo-opener as that of the diamond drill when it recently encountered water on the 3000 level. When the flood forced itself through the feed pipe up to the 2560 level it said in plain words that all the eastings on all the levels from the 2560 to the 3000 level had been in vain. None of them had been far enough or in the right spot to tap this water; hence here is an unexplored vein, the condition of which is entirely unknown. Its horderings to the west on the 3000 level are good; the indications on the 2760 are suggestive, hut further than this all is conjecture. That strike of water multiplied the prospects of Belcher at least a hundred fold. Further south interest centers chiefly around the crosscuts recently started in Alta, which have not yet been pushed far enough to he productive and to the opening of virgin ground in Silver Hill.

The Dangers of Tunnel Driving.

The disease and mortality among the laborers in the St. Gothard tunnel has been excessive. The distance between the entrance to the tunnel and tho places where the perforators were at work, which was nearly five miles on the north side, coupled with the frequent freezing of the compressers, rendered ventilation extremely difficulty; nnd the nir was further fouled hy frequent explosions of dynamite, the smoke of some 500 oil lamps and the exhalations of 400 men and 40 horses, working in a temperaturo of 80° to 95°. The horses, nlthough working only eight hours in twenty-four, died at the rate of 25% per month, often dropping down suddenly in their tracks as though shot dead. The men died in large numhers of n peculiar disease called tunnel trichinoses, from the presence of an entozoon in the intestines. Three or four months lahor in the tunnel brought on the disease, aud twolve months generally made the laborer a confirmed invalid, even if he survived. The symptoms were yellowness of skin, features drawn, eyes half closed, lips discolored, skin humid and gait difficult. Even when the food was taken with appetite it would not digest, and wine was invariahly rejected. The Italian doctors pronounced the tunnel "a veritable h—l."

Bullion Shipments.*

Since our last issue, we have noticed the following hullion shipments:

Oneida, for March, $7,321; Christy, Apr. 6, $3,707.17; Contention, Mnr. 30, $5,083.92; Alice, Mar. 30, $8,000; Dexter, Mar. 30, $2,500; Wells, Fargo & Co., at Eureka, Apr. 7, $1,800; Richmond, Mar. 7, $15,720.05; Standard Con., Mar. 5, $30,070.49; Bulwer, Con., Mar. 5, $8,781.79; Bodie Con., Mar. 5, $4,884.80; Mar. 1 to Mar. 24, $24,284; Grand Prize mine, for March, $18,722; Con. Virginia, Apr. 10, $58,556.50; Northern Belle, Apr. 7, $7,902.78; Paradise Valley, Apr. 7, $3,556.10; Northern Belle, Apr. 10, $9,033.08; Christy, Apr. 13, $6,306; Golden Terra, Apr. 3, $27,000; Standard Con., Apr. 12, $40,704.68; Bulwer Con., Apr. 12, $7,771.75; Gold Hill (I. T.), Apr. 8, $28,120; Noonday, Mar. 1 to Mar. 24, $16,598.

*Desiring to make our list of Bullion Shipments as complete as possible, we will be thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

THE Postoffice Department, during the first nine months of the present year, issued to Postmasters $23,979,335 in postage stamps, stamped envelopes and postal cards.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

PROSPECTING. Amador *Dispatch*, April 10: There seems to be quite a revival in quartz prospecting in the vicinity of the Montcrichard mine. We understand that Rigney & Caminetti and Wilson & Kitridge have struck encouraging leads, and are now sinking shafts on their respective claims.

DRYTOWN ITEMS.—The Gover has been getting out good rock lately, but not in sufficient quantities to keep the mill running steadily, as the vein is at present only 2 or 3 ft wide. The Quartz Mountain company is progressing rapidly with their preparations for roasting and milling, and will probably be ready to commence in a few days. The outlook for them seems to be very favorable, as they have had assays of $36 gold, and $80 in silver out of the refuse rock on the old dump. The Yellow Jacket has had no crushing yet, on account of the high water washing their pipe away, but they intend connecting the pipe which runs the pump at the mine with the Bonanza mill, to which runs a newly-graded track on trestle work across the creek. They have a ledge about 5½ ft in width, of splendid rock. There is a rumor here to the effect that a company of New York capitalists have bonded the California and N. California mines (formerly the Potosi and Webster), and are also negotiating for the North Gover.

SHAKE RIDGE ITEMS.—The Ourang Gutang quartz-mining company, of Shake Ridge, has commenced operations on their claim, which is located about 1½ miles southeast of the Golden Gate mine. We understand that Mr. Heath, from Whitmore's mill, has struck some very rich diggings on Mill creek, from which he is taking out about $10 per day.

CALAVERAS.

HYDRAULIC "DROPS."—Calaveras *Chronicle*, April 10: Clean-ups have been made this week in 2 of the great hydraulic claims in this vicinity. First, the Mammoth, on Tunnel ridge, "Veith's claim," gave an account of itself. The golden brick is said to have been one of the biggest ever cast here, worth between $25,000 and $30,000. Next comes the Maison de Sente with a handsome clean-up; not quite so large as that of the Mammoth, but reaching well into the thousands, nevertheless. The Maison de Sante is one of the best paying mines in this vicinity, relatively speaking, the scale of operations being taken into consideration.

BREAK IN THE DITCH.—During the severe rainstorm of Friday of last week, the Water company's ditch broke. By dint of hard work and perseverance, damages have been so far repaired that the water will be got through this morning.

SHEEP RANCH.—We have it from excellent authority that the future prospects of the Wallace & Ferguson mine, at Sheep Ranch, are more brilliant than ever. The main shaft has now reached a depth of 400 ft, and levels are about to be run. At that point the ledge shows wider than ever, while the rock is fully the equal in richness of any ever taken from the mine.

STRUCK IT.—We are very glad to hear that a wide ledge of good rock has been struck in San Pedro at Glencoe.

ABOUT ANGELS.—*Echo*, April 10: We learn that John Miller, of Albany Flat, recently discovered a huge pocket, out of which he obtained as high as $60 to the pan. The Dogtown mines were never looking better. The mines in the vicinity of Angels are doing as well or better than at any time during the past 2 years. Quite a number of men are engaged in working on the Invincible, with good prospects ahead. We hear favorable reports from the Murphys mines. Some of the claims are paying better than the most sanguine had hoped for. The mines in the vicinity of Vallecito are said to be doing well. Some claims on the flat are immensely rich. Henry Geriach, of Angels, found a piece of gold the other day weighing considerably less than $700.

EL DORADO.

GREENWOOD ITEMS.—Georgetown *Gazette*, April 10: The French mine, owned by the California Water Co. and Simon Desmarchels, under the management of the latter, is paying handsomely. F. C. Leavitt has sent to San Francisco 10 tons of ore from the French mine to be tested by Frank Shay & Co.'s new process, by which it is claimed all the precious metals will be extracted and saved. The Bower have run a sluice grade tunnel from American canyon through the hill, and are now under bedrock flat, formerly noted for its rich gold deposits. They are now raising the tunnel, and when the opening is made to the surface they will commence washing said flat by hydraulic process. The Blibtrue & Schaller mine, located on west side of American canyon, is steadily worked by hydraulic process, and the owners are realizing handsomely. The Brockmann mine is located on the south side of the toll road from Greenwood to Georgetown. A decomposed quartz lode for the cropping can readily be traced on the surface for a long distance on the range. The Black Rock mine, owned by C. Leavitt, T. Pendergast and other residents of San Francisco, having erected a fine five-stamp mill on the premises, are now steadily developing the mine.

MARIPOSA.

MERCED HYDRAULIC MINING CO.—Mariposa *Gazette*, April 10: The Merced Hydraulic Co. at the Red Bank are pushing the work of hydraulic mining most vigorously ahead. At present there is an ample supply of water, which is received from Scott's gulch. The little giant exposed a boulder of about 500 pounds of slate and quartz mixed, one side of which was covered with quartz well filled with free gold. The Red Bank aside from its vast body of good paying dirt and gravel is known to contain rich deposits of the precious metal mixed with quartz and other substances carrying minerals. Already Surveyor Bost is on the ground surveying the route for a canal, to connect the works with the Benton mill dam, a distance of about 2 miles. This will insure plenty of water for hydraulicing purposes the whole year.

MONO.

ADDENDA.—Bodie *News*, April 11th. Preparations for putting guides in the shaft and placing cages in position for facilitating the work of development are now in progress, and when completed this mine will be worked on the true Comstock style.

SOUTH NOONDAY.—The north drift, 150 level, is 0 ft wide of good milling ore. Work in the north drift has been suspended for the present at a point 44 ft north of the main east crosscut, at which place a winze has been started on the ledge and is now down 6 ft. Judging from present appearances in the winze a large body of high-grade ore will be opened up. Are still piling up the ore extracted, on the ore dump for future use.

QUEEN BEE.—Work in the north drift on the 400 level is being pushed steadily forward. The ledge shows a very fine body of ore of a better quality than yet uncovered and gives promise of opening out into a very heavy body of high-grade ore. The character of the ore is decomposed quartz that crumbles in the hand and borns free gold.

TIOGA.—The flow of water continues about the same, the average being 3,600 gallons per day. Since connecting with the Syndicate at the 520 level it has become necessary to timber about 000 ft of the tunnel, which is now being done.

SOUTH STANDARD.—The rock works and breaks well, the formation continuing of the same favorable character, cutting seams of ore that give good assays and clay seams that yield free gold, all standing in nearly a vertical position, making from the surface. The mine is now entirely free from water.

KING BEE.—The formation continues of the same favorable character, bunches and stringers of bright, lively quartz continually coming in. A station set has been put in at the 200 level preparatory to drifting and crosscutting.

BODIE TUNNEL.—The building at the month of the tunnel for the reception of the company's machinery is all raised and partially closed in. The machinery is now due here and expected to arrive at any day, when it will be immediately set in place and the work of extracting milling ore from the numerous veins of the company will be prosecuted.

NORTH STANDARD AND BULWER.—Since cutting the Calhahan lode they have passed through a very fine formation of vein porphyry that works well and gives good indications of cutting other ore bodies.

NEVADA.

BROINNINO WORK.—Nevada *Transcript*, April 10: Dr. Holdsworth has ordered of the Marysville foundry a water-power saw mill and four-stamp quartz mill, with which to begin work on the Mastodon gravel claim above Eureka. The machinery will be delivered on the ground about May 15th.

A GOOD PROSPECT.—A. Vance & Co., who are developing a ledge near the Sneath & Clay mine, on Ould Flat, have thus far extracted about three tons of ore, which is said to be of very good quality.

SIERRA.

NORTH FORK.—*Mountain Messenger*, April 10: From a candle box of gravel, taken out of this rich drifting claim at Forest City, the handsome sum of $11 was realized. In the North Fork gangways gravel extends down one-third the depth of the tunnel.

KENTON.—Nothing is being done at the Kenton. A sale of this quartz property is being negotiated in New York by C. S. Benham, L. C. Butterfield and others, with good prospect of its advantageous disposal to foreign capitalists.

SCHULTZ.—Baid Mountain Quartz Co., 2 miles and a half down Oregon creek, below Forest City, have run a tunnel 200 ft through blasting slate rock, nearly east, tapping the ledge, which promises well.

ORIENTAL.—The Oriental company, Allegbany, J. T. Bradbury Superintendent, are now running a crosscut on the 5th level to the footwall, where parties have worked over and left 8 ft of the ledge. The hoisting works are pumping out the water, day and night, at the rapid speed of 20 strokes a minute, and in a few days the mine will be drained to the 6th level, where rich quartz will be taken out. Six men are now employed. A larger force will soon be needed.

RAPID PROGRESS.—John Pearce, F. Craze, W. Lawry and T. Veal, the persevering and energetic contractors of the Bald Mountain Extension Co., Forest City, are now pushing their tunnel ahead at such rapid speed as to surprise even the oldest veteran miners who have been in that mining district since the good old times. Last month 100 ft of tunnel was run in the surprisingly brief period of 21 days, through cement or mountain lava. A fair profit is realized from the contract price per foot, $5. Holes are drilled in the face of the tunnel, from 3½ to 4 ft in depth, every blast throwing out about 2 ft of rock. Ten pounds of Giant powder are used for each day and night shift of 24 hours. No timbers are required, and on completion, should the lava formation continue, this airline tunnel will never need repairing and be a permanent "open sesamo" to the inexhaustible treasure vaults of Bald Mountain. The dimensions are 6½ ft high by 5½ in width. Fifteen carloads of cement are run out every 24 hours, which, considering the present length of the tunnel, over 1,700 ft, and also that only hand power is employed, is a very creditable amount of work for 4 men in the short time allowed. The water in the air shaft has a fall of 64 ft, thoroughly ventilating the tunnel. The supposition now is that possibly underneath the strata of lava there may be a rich gravel bed coursing through the South Fork to the Bald Mountain Extension ground.

TUOLUMNE.

COLUMBIA.—Tuolumne *Independent*, April 10: Mining and general work is again being resumed upon the advent of pleasant, sunshiny weather. Prospectors can be seen every morning in Columbia starting out with their pick, shovel and pan, heading for the mountains. New bonanzas will be discovered that have been traveled over for years by the old miners of early days. There is waiting in old Tuolumne county some of the richest mineral deposits on the Pacific coast.

LITTLE GEM is turning out the most flattering showings as a milling vein. The proprietor commenced the erection of a 10-stamp mill on the mine a year ago; all of which was accomplished from the proceeds of the mine during the time, by simply pounding the ore in a hand-mortar. The mill is complete and now in operation, working the lower grade ores that were thrown on the waste dump.

ALABAMA.—Work is being vigorously pushed towards placing the mine in the best possible condition for extracting and milling the ore. Through judicious management there is, in this claim, a large body of ore, which can be made available by a trifling outlay, in quantities that will supply a 50-stamp mill for many years to come. Other companies, located on the mother lode, east of the Alabama claim, and on Whisky hill, are actively engaged in developing their valuable mines. These are: The Moony & Co., the Preston & Co. and the T. C. Gresher claims. The probabilities are, during the coming summer, quartz mills will be erected on these various claims and Jamestown become the center of a rich quartz mining district, and from the steadily-increasing wealth of its mines will become a mountain town of no little commercial importance.

QUARTZ MT. G. M. Co.—This is the only mine at present on the mountain in full and active operation. A small force of miners employed in the mine take out ore in sufficient quantities to keep a 25-stamp mill running. The mill is convenient to the mine, and is one of the largest and best in the county. The company has placed, in connection with the ordinary batteries and plates, the most improved machinery for concentrating the sulphurets, separating, etc. Power is furnished by a 45-ft overshot water-wheel. The works have been carried down 500 ft.

KNOX & BOYLE.—This mine has been in progress of development a number of years, under management of A. B. Preston. Its present showing is very encouraging, and, so far as prospected, indicates permanency. A larger percentage of the vein is a very high-grade ore.

APP CLAIM.—This claim is located on a parallel lode—parallel to the great fissure vein which traverses the county, having an easterly and westerly course, and about 300 ft from this lode. Power is obtained from a large overshot water-wheel. Water can be supplied at reasonable rates. The working shaft is down on the vein 800 ft, in good milling ore. Then there are a number of other claims located on the main lode; also a number of side veins in progress of development.

TRINITY.

DEADWOOD.—Cor. Trinity *Journal*, April 10: Dolliffo is crushing Willey's rock from the Vermont ledge with Klein's upper arastra. Geo. Klein recently made a clean-up from 40 tons of $50 rock, Sebastian is running at full speed, Henry Overdick is taking rock out of the Monto Christo mine. Fred Diener is running both arastras on Frick & Davis rock, with enough on the dump and what they are getting out to keep him going for 6 weeks yet. Gibson Bros. are running their arastra in Donnelly gulch, in good rock. Spencer & Kelley have 130 tons on their dump; they have commenced digging a ditch, and will put up an arastra.

NEVADA.

WASHOE DISTRICT.

BELCHER.—Gold Hill *News*, April 14: Superintendent Smith expresses a determination to push the east crosscut from the south drift on the 2760 level ahead till the vein is thoroughly prospected in that direction. The proposition is being urged of connecting with the Yellow Jacket shaft on the 2760 level—2700 level of the Jacket—so that when the pumps of the Jacket are in working order they may be used to handle water, should more be encountered than can be conveniently raised by the Belcher pumps. The workings in this direction are already well into Kentuck ground.

OPHIR.—The north drift on the 2500 level is in 340 ft, and is passing through vein porphyry showing low-grade quartz.

UNION SHAFT.—The shaft has reached the 2500 level and a sump is being prepared. When this is completed a tank and pump station (so that the main pumps can be extended to this level) will be a necessity, and while the stations are being made the contemplated drift to connect with the 2500 station of the Sierra Nevada incline will be started. Repairs to the broken bobs are progressing well.

SIERRA NEVADA.—The east winze is being timbered from the 2300 to the 2400 level. The lateral drift north, on the 2400 level, has just been started, as has also a crosscut east from the foot of the winze.

CON. VIRGINIA.—The old workings on the 1500 and 1750 levels continue their yield of ore. The joint California east crosscut on the 2200 level continues in vein material showing some quartz.

NORTH BONANZA.—The winze from the 400 level is being continued on down, and is still in the body of base ore before noted. This body is certainly of large extent, as is proved by the explorations along and in it already made.

UNION CON.—The work of sinking a sump for winze No. 1 from the 2400 level still occupies attention. The stopes continue their accustomed yield of good milling ore.

CALIFORNIA.—The west crosscut on the 1500 level has reached the vein formation lying east of the old stopes; total length, 215 ft. The raise from the 2100 level is up 50 ft, and in low-grade quartz.

GOULD & CURRY.—The O. & C. and B. & B. shaft has attained a depth of 1,015 ft, where it is allowed to rest till the raise from the 1700 level connects with it.

CHOLLAR.—The south drift on the 2400 level is nearing the point where the vein is supposed, from its make on the levels above, to have swung heavily to the east.

HALE & NORCROSS.—The work of sinking the incline has of late been waited on to the necessity of perfecting a drain through the Chollar connection to the C. N. S. shaft, so that the water can be conducted to the pumps, there to be raised to the Sutro tunnel level.

SILVER HILL.—Both workings on the 1300 level are looking remarkably well.

MEXICAN.—No work has been done in the joint Union east crosscut, 2300 level, on account of the indications of water encountered. The drill holes have even been stopped up to prevent the flow of water tapped by the drills.

SIERRA.—Still following the ore body below the tunnel level. It improves with depth. Preparations are being continued to erect works and place machinery.

JULIA CON.—The old works have been shut down and hereafter work will be conducted through the Ward shaft, of which the company owns the half. Prospecting will be renewed on the 2200 level when the shaft reaches that depth.

ANDES.—The raise from the 200 level is opening up some low-grade quartz.

YELLOW JACKET.—The shaft is being pushed on down at the rate of a set of timbers per day; total depth, 2,925 ft.

SUTRO TUNNEL.—The north header is rapidly nearing the point of connection with the workings west from the C. & C. shaft. Work has been resumed in the south header and is progressing well.

NEW YORK.—Drifting south in the vein on the 1600 level and encountering a promising formation, the quartz of which yields encouraging assays.

I X L DISTRICT.

CARBONATE.—Paradise *Reporter:* Judge Harlan, who has just returned from I X L district, reports a good deal of snow in the mountains, although he was well pleased with the looks of the camp, and thinks I X L will be a second Eureka in less than a year. He reports mountains of carbonate ore of low grade, and with such excellent and convenient facilities for treatment, that they can be worked profitably, nut pine and water being abundant.

ARIZONA.

PROSPECTING.—*Arizona Sentinel*, April 10: The mining news from all parts of the county is most favorable. Parties are arriving daily by rail and wagons, and spreading themselves from Yuma to Williams Fort, on the north, up the forks and beyond into the ranges trending to the Gila, and embracing the Centennial district, and so along down into the Castle Dome range and district and Montezuma district adjoining the former on the southeast. In the latter place prospecting has been going on quietly for some months past by Mr. W. P. Miller and his associates. Veins of copper have been discovered and partially opened, showing heavy percentages of that metal, together with very considerable quantities of gold, and letterly, rich injections of silver, chlorides and carbonates. Prof. Blake has been some days at Castle Dome district, inspecting properties under his control, and it is currently reported that a formal opening of them will shortly be made, with all the adjuncts of improved machinery.

TOMBSTONE.—*Nugget*, April 8: The following is an exploitation of the mines belonging to the Tough Nut Co.: Tough Nut, 703 ft; levels, 1,520; cuts, 404. Goodenough, 147 ft; levels, 419; cuts, 45. West Side, 113 ft; Defense, 13-ft shaft. Surveyor, 10-ft shaft. Total shaft, 986 ft; levels, 1,033 ft; cuts, 440 ft. The cost of operating the mines and mill per ton is as follows: Mining, $2.50; transportation to mill, $4.15. reducing, $5; total, $11.65. The mill has been in operation something more than 0 months and has produced bullion during that time amounting to over $300,000.

AVERAGE.—A fair average of the real value of tho ore in the Grand Central may be taken from the following figures. A sample of the ore taken from the upper level from each bucket during an entire day and then averaged on 3 different days, assayed as follows: First day, silver, $1,013.79; gold, $110.46; second day, silver, $370.20; gold, $50.27; third day, silver, $020; gold, $100. No ore has been taken from the mine only as required to sink the shaft and run the levels, and there are now 1,200 tons on dump. Steam hoisting works are to be erected immediately, when the work of developing will begin in earnest.

BULLION.—The amount of bullion received in Tucson last week from the mills of Tombstone district was $82,420.83. Of this amount only $4,912.57 was from the Corbin mill, which was only in operation a portion of the time, but when that one is in full blast, the yield of their 15 stamps can be well imagined when understood that they will run on the same ore as the Tombstone mill, which chipped $16,710.76 during the week as against $30,300.60 from the Contention. These amounts exceed the combined shipments of all the mills of the Territory, prior to Tombstone's discovery.

TURQUOISE DISTRICT.—This district and its neighborhood are becoming as prominent as any section about us. Fine samples of ore are being brought in almost every day, and a great deal of work is being done. Samples from the Alice mine, owned by Leonard, Pace & Frary, yielded, from several tests, $72 silver, $6 gold and 60% copper. Such a showing as this is well worthy the attention of anyone desiring to invest in mines.

DAKOTA.

CARBONATE.—*Black Hills Times*, April 7: What's the use of going to the sickly camp of Leadville for carbonates when we have mountains of it right here in the Black Hills? We have lying on our table at this present writing about 1 pound of yellow carbonate ore from the Lucky Boy, Bald mountain, so rich that silver can be melted from it with a common blowpipe. Small pockets of carbonates have been found in different parts of that district upon several occasions during the past year; but now Thomas P. Edwards, the owner of the above-named mine, which is located on Nevada gulch, near the new silver mill, has struck a well-defined vein of it, from 2½ to 4 ft in thickness, lying between shale and quartzite formations. The vein, which was encountered about 10 ft from the surface, has a dip of between 15° and 20°, and widens as it is followed in. Mr. Edwards, who has 3 claims lying side by side along the foot of the mountain, has tapped this same bed of carbonates in each, thus showing that it is extensive. It is believed that the same bed extends across the gulch, as Gen. West has found a similar vein on the oppo-

The Proposed Mining Law.

CONTINUED FROM PAGE 242.

not been or shall not within one year thereafter be consummated by the required payment of purchase money, such unconsummated claims shall lapse, and the land embraced therein shall thereafter be enhject only to the operations of this chapter." Where such claims shall not he consummated within one year, hy the required payment of purchase money! What is the plain English of this language, what does it mean and what is it intended to mean? "Consummated," hy Webster, means "completed," "perfected," "ended." Where such claims, then, have not been completed or perfected or ended within one year, hy paying the Government therefor, all such claims shall lapse, that is, fall in or become forfeited. How is it possible that a claim can be completed or perfected or ended until the owner has obtained an absolute title thereto from the Government? And how can he ohtain such a title without applying to the Government for a patent? And how can he ohtain his patent without doing all those things required hy the hill in order to ohtain his patent? So you see that it is manifest from the language of the proviso itself that the intention of the bill is to compel all owners of mining claims located under previous acts of Congress, to apply for patents to the same, under a penalty for failing to do so of forfeiture of the claim. It is therefore unnecessary to go further and look to the context, the spirit and ohject of the hill, or the surrounding circumstances and conditions of the country, in order to conclude that the intention of this proviso ie to compel ownere of claims located under previous acts of Congress to apply for patents to such claims "within one year thereafter" or lose them. But what is meant hy the language "within one year thereafter?" What is the time allowed hy thie language within which the claimant can make bis application for his patent? From what time, circumstance or event. does the year commence running? Does it mean within one year from the passage of the bill into a law, or does it mean eomething eise? "Thereafter" what or when? This language seems to my mind obscure, uncertain and unintelligible. If it is intended to force all claimants of claims located under previous acts of Congress, or located hefore any act of Congress was passed on the subject of locating and obtaining Government titles to mines, to apply for patents to their claims under a penalty, in case of failure to do so of forfeiture of the claim, why not say so in plain, intelligible and unmistakable language? It is true that such a law would he altogether wrong, oppressive and unjust, hut then if that is the intention, it is better to eay so in such language as cannot he mistaken, than to leave the section (190) so ohscure, uncertain and unintelligihle, that no one can he certain of its purport and meaning. A. B. ELLIOT.

Virginia, Nevada, April 2, 1880.

Hardened vs. Unhardened Horseshoes.

EDITORS PRESS:—To make horses-hoes last tbey should he toed with steel in the usual way, or a small piece of hlister steel not larger than your thumb, welded across the shoe at the toe, will answer all practical purposes. The shoe thea, after heing well leveled, should be heated to as high a heat as the steel will eafely bear, and then plunged into cold water, toe down; the shoe being held in a vertical position while cooling to prevent springing.

Blacksmiths will tell you that shoes treated ae above will hreak, hut never mind that. Fit them well to the feet, and you will have shoes that will last two or three times as long as similar shoes unhardened will. In fact, they will last so long that it will he necessary to ehift and nail them on several times hefore they can he worn out, it heing impractical to let them remain on until worn out for apparent reasone that need no explanation. B. T.

DEBRIS QUESTION IN CONGRESS.—The House Committee on Mines and Mining have reported the joint resolution heretofore agreed upon hy the Committee, which provides for the appointment of a commission of two civil engineers and one officer of the Coast Survey to investigate the debris question, and appropriates $250,000, to he forthwith expended under the direction of the Secretary of War for the protection of the navigahle streame of California from further injury hy loosened debris now in the mountain gorges. The joint resolution was placed on the calendar for future action. It will bave to await its turn and is not likely to be reached for two months or more.

THE PIONEER WOOLEN MILLS.—Work on the new building for the Pioneer Woolen Mills at North Point will he pushed forward as rapidly as possihle. The foundation has heen laid, and the walls nre np to the line of the ground floor, and these are now ready to receive the floor timhers. When the New Constitution went into force the proprietors of the mills discharged all the Chinese employed in and around the premises, and filled their places with white boys and girls. Since then the quarters formerly oocupied hy the Chinese employees have heen demolished, and now not a Chinaman is to he seen around the mills.

Edible Mushrooms.

Varieties of Field Fungi Fitted for Food.

At the Academy nf Sciencee February 16th, Justin P. Moore, of San Rafael, read a paper on "Edible Fungi," which gives a good deal of practical information thnt ought to he more generally known in relation to the varions kinds of mushrooms fitted for human food. After a brief introductory of the subject, Mr. Moore eaid:

Claseification of Edible Mushroome.

Let us now suppose that you are going in quest of edihle mushrooms. Briefly, let me give you the orders:

First—Will come such as have a cap, or *pileus*, as it is called, with platee or gills on the under side of the pileus, with a stem, with or without a ring. This is the characteristic in general of the order of *Agaricini*.

Second—Such as have a pileus or cap, and instead of gills have pores or tubes on the under side of the pileus, the characteristio of the order of *Polyporei*.

Third—Such as have a pileus, and, instead of gills or tuhes, have spines on the under side of the pileus; characteristic of the Order of *Hydnei*.

Fourth—Such as have a pileus, hut neither gills, pores or spines, but the whole cap is crumpled up or folded into lohes; characteristic of the order of *Elveltacei*.

Fifth—Such as resemhle coral, *i. e.*, are hranched, the hranches heing unequal, elongated, mostly acute, pure white, sometimes violet at the hase; characteristic of the order of *Clavarei*.

Sixth—Snch as are a simple ball, often attaiuing a large size, which, in age, breaks up into a powdery mass; characteristic of the Order of *Trichogastres*, nnder which is placed the so-called puff-ball.

You have hut to look a moment at any of your fungi to determine under which of the above orders it will fall.

With perhaps one or two exceptions, all edible fungi may he classed under some one of the orders just named.

Having now learned the order, we may proceed to learn a few of the most readily dietinguished species under each order.

The Earliest Appearing Muehroom.

To hegin with the first order, the *Agaricini*, I think that the earliest appearing mushroom in thie city may he found in our plazas.

As it pushes it snowy white cap up through the grass it looks like a large long egg. Soon the top turns to a brownish hue and the skin breaks up into hroad scales, and the flesh splits open, revealiug its pure pinkish tint. The gills are long, numerous, pinkish, and on hreaking open the cap the stem falls out. The stem is hulhous and has a movable ring. As soon as the plant matures it turns into an inky mass. Don't eat it then. When young it is very tender and delicate, and taetes eomething like vermicelli. It is called the shaggy Coprinus (*Coprinus comatus*). *A good way to cook these*, or, in fact, any mushroom, is to *bake them under* a glsss or basin, on toast, along with a little scalded cream or melted butter. Add a clove, some salt and pepper to taste. Cook for 15 minntes in a gentle over, and when done allow the cover to remain on for a few minutes till all the aroma has heen absorbed by the toast.

A great many other spccies helonging to this orde: make their appearance soon after the one just mentioned.

Of the gill-bearing mushrooms wbich may be eaten, there are to he found in this vicinity 42 species. To describe all these would take too much of your time.

The Market Mushroom.

The common mnshroom of our markets, which to most people is *the* mushroom, I need only allude to. It helongs to the *Pratellæ*, or pasture mushrooms, having hrown or hrownish purple spores. It helongs in our botany to the *Psalliota* (from *psalion*, Greek, a rink), as it has the veil fixed to the stem and forming a ring.

There are two or three varieties to he found in our markets.

At first they push up through the ground as small huttons, or like little puff halls. (They are at their hest in this condition.) The cap is smooth or slightly scaly, generally when young, white, then hrownish or tawny. The gills are at first pallid, then flesh color or pink, then hrown, then tawny hlack. The stem is white and has a well-marked ring. In our most common variety the ring, however, is fugacious. I have not yet fonnd ahundant the common English mushroom, *Agaricus campestris*, growing wild upon our hillsides; hut in its place the closely allied *Agaricus arvensis*, which in England is called "the horse mushroom," or that other which is known as *Agaricus pratensis*. They are all easy of cultivation, and ought to receive more attention in this respect, though I confess that for me they are among the pooreet mushrooms of my gathering.

How to Dry Muehrooms.

I wonld recommend drying them for use when mushrooms are not ahundant. To dry mushrooms, wipe them clean, peel off the skin and take out the gills. Lay them on eome paper and put them in a moderately warm oven to dry. When dry put them in cans or paper bags, and keep them in a dry place. When wanted, put them into cold gravy and bring them gradually to a simmer. They will thus regain their size and taste,

A Highly-Prized Mushroom.

Later in the season, from January to Marcb, may he found a solitary mushroom, which to one unacquainted, is always classed as a toadetool, and yet, thronghout the world, it is highly prized. It ie so prominent when it hreake through the ground, and its characteristics eo marked, that it may he easily known. I have never seen it in our market, though I have gathered it on the hills hy Lone mountain and southward. I allude to what is known in the botany as *Agaricus procerus;* the Parasolschwam of the German, the Columelle of the French, the Rubhola Maggiore of the Italian, or the Cogomelee of the Spaniard. The pileus, when young, is globose, when expanded in age, sometimes being from eix to eight inches across, and covered with a thick skin, which hreaks up into scales, which are large, raised and persistent at the center. The flesh is white. The gille are very remote, *i. e.*, separated from the stem, and of a pale flesh color. The etem is tall, hollow, hulhous, tapering upward, and variegated with closely pressed scales. The ring is movahle, *i. e.*, will slip up and down on the stem. On removing the stem a large hollow or eocket remains. The odor of this mushroom reeembles that of fresh meat. The taste is mild.

It is preferred hy many to the common mushroom, as having a finer flesh, and more easy of digestion. For catsup it is unsurpassed. It is quickly cooked, and may he eerved with chicken fricasse. It may be hroiled or cooked in a close-covered dish with fine herbe, pepper, salt and hread crumhs. The etem is too leathery to he eaten.

How to Make Mushroom Ketchup.

I will here add *a simple method for making ketchup*. To a peck of mushrooms chopped fiue add one-half pound of salt. Let them stand for four days and then etrain and pass through a cloth. Allow the liquor to settle and pour it off into a stew-pan. Add now one-quarter ounce of allspice, one-qnarter ounce of whole pepper, and a small piece of ginger. Boil the whole one-half hour, and when cold, bottle.

Other Gill-Bearing Mushroome.

I will speak of hut two species more of the gill-hearing mushrooms. I mention them, as they helong to a different subdivision from those which I have mentioned.

The first one to which I will allude possesses a milky juice, and hence the genue ie called *Lactarius*.

The characteristics of this are so marked that it never need be mistaken.

The pileus ie fleshy, *zoned* (this is true quite generally of the order)—two to four inches across; color, reddish orange. The skin is smooth and viscid. The center of the pileus is depressed, and the zones are of a darker color than the center. The edge ie smooth, and when young is rolled in. The gills are of the same color ns the pileus, run down the stem, and are firm. The stem is two to three inches in hight, stuffed, then hollow and spotted.

When the gills are hroken, the milk is at first of a red orange hue, then, on exposure, it turns green. This fact must not he overlooked. If the milk is white, it ie as well to let them alone.

One fungus is known in the botany as *Lactarius deliciosus*, and it well deserves its title. A good way of cooking them is as follows: Mince as many of them as may be required, and fry them in a pan with a piece of butter, stirring them about meanwhile. When done, strew over them salt, pepper, parsley, chopped fine, a small piece of shalot and a little flour. And, finally, if you choose, a glass of champagne or cherry, and a little lemon juice.

A Yellow Mushroom.

There is a heautiful little yellow mushroom, known all over the world as the Chantarelle, which is occasionally met with here, though about San Rafael and northward it ie more common. It ie highly spoken of by all lovers of mushrooms, many preferring them, when properly cooked, to the truffle. It may he easily known hy its brilliant yolk of egg-yellow pileus, which is at first convex, then, as it grows older, is funnel-shaped. The gills are thick, swollen, branched, and of the same color as the pileus; the stem is tough, solid and of the same color as the pileus. Our fungus is known hy the name of *Cantharellus cibarius*.

If etewed, they must he slowly cooked; otherwise, they will he tough.

Fried in hntter or cooked in any of the ordinary forms, they are delicious.

Porous and Tubular Mushrooms.

I will now pass to the eecond division, tbose which have no gills, hut in their place are pores or tnhes.

There are a great many representatives of the *Polyporei* on our hillsides and among the oaks or other woods. Of one, only, will I etop to speak in this article. That is quite common about Lone mountain, at Oakland, Saucelito and San Rafael. It is called *Boletus edulis* or the *Edible boletus*.

It is a mushroom of ancient renown. Dr. Badham says of it: "The ancient Romane were well acquainted with thie truly delicious fungus, and in general appear to have done it justice." The cap is of a reddish or russet hrown, from three to eix inches across. The flesh when cut remains white. The pores or tubes are at first yellowish, then greenish. The stem is always thick, solid and ringless, and beautifully reticulated near the top. Bearing in mind the above, there is no danger of mistaking it. If your fungus, on heing cut, changes to a hluish, greenish or blackish, it is best to reject it.

As to its properties, I can only say what has always been said nf it: "Whether boiled, stewed with salt, pepper and bntter, fried or roasted with onions and hutter, this species proves itself one of the most delicious and tender objecte nf food ever submitted in the operation of cooking." I will add hut one method of cooking them, as given hy Paulet: "Having dried some of them in an oven, soak them in tepid water, thickening with toasted hread till the whole be of the consistency of *puree*, then rub through a sieve, throw in some which have been firet etewed, boil together and serve with the usnal condiments."

Spined Muehrooms.

The next class to which we come incldes such as have as stated spines or teeth on the under side of the pileus—the hydnee.

I helieve that nearly if not all the species of this order which are fleshy are edible—*Hydnum coralloides*. The coral-like hyndum is one of the most common. It grows on oaks, generally fallen trees, and looks like a large white maes of coral. In age it turns a light hrown. It may safely he eaten when young.

Hydnum repandium is occasionnlly to he met with. The pileus is yellowish or reddish, large, wavy, flesh white. The spines are pale yellow, and of unequal length. The stem is solid, and often out of center. There is not much chance of mistaking the fungus. Stewed slowly; it is excellent. It is good to dry these, as they may be kept for future use. If dried, these as well as other fungi mentioned, may he powdered and put in close cans. This is what is sold as mushroom powder, and is excellent for thickening soups.

The next division, *Elvellacei*, is well represented here. We have of edible speciee six, the most common being gyromitra esculenta. The cap of thie is hlack or cinerous brown, and looks like a crumpled mass. The stem is of a dirty white, and full of holes. It hns no gills. I know of no more savory dish.

The edible morell is also found hcre, and differe from the last, in that the cap is generally of a conical shape, and more or lese pitted. It ie a luxury in any part of the world. They are easily dried, and would bring a great price in onr market if once known here. There are so many ways of cooking them that I despair of mentioning them. Stuff them with veal stuffing and anchovy sauce, and dress them between slices of hacon, if you wish a good dish.

Of the *Clavarei*, which have neither cap nor gills, hut are branched ae coral, and smootb, I say hut this, that we bave one or two edible species, but they are so rare as to be of little consequence.

The Puff-ball Mushroom.

We now come to the last division, the *Trichogastres*. In the course of a day or two after our first raine may be fonnd on our dry and southerly exposed billsides, in fields or paetures, that lsrge, white-looking, leathery-feeling hall which is called the puff-hall. This is the *Lycoperdon giganteum* of the boteny. It is the most easily recognized and the best known of the so-called toad-stools. Whenever you see it once you will always recognize it hy its size, often growing to 10 or 20 inchee in diameter; hy its smooth, leathery-feeling ekin, varying in color from snow-white to almost hlack; and by its pure, soft, white flesh when it is young. Cut it oper, and if you see no yellow stains within, take it home at once. You have secured a good, wholesome dish; it may he enough for an entire meal for three or four pereone.

Bear alwaye in mind that this, like any other mushroom, is to be eaten only when fresh, never when there is any yellow within, for then decay has begun, and it is no more to he served up than you would serve up a rotten potato.

As with us here, it is the first to come, so I regard it the simplest and surest for beginners, and ns safe to eat as good Irish potatoes. "When fresh and properly prepared, it yields to no other in digestihility. It may he cut in thick slices and broiled as a good steak, or in thin slices dipped in egg and hread crumbs and well fried; eo prepared, it has the flavor of a rich, light omelette." When cut in slices and fried, it is excellent for use at nny time.

I have aimed in this to show you only a few of the most common and easily known of our mushrooms. I do not know that any of the species mentioned, save oue, ever appear in onr market. They ought all to appear, and there is no reason way we ehould be importing mushroom cateup, when we have ahnndant material with which to make it here.

Now, if one will not learn the edible species, and will persist in eating old and and large specimens, it must not he surprising if now and then a case of poisoning occurs. *Bear this in mind: All mushrooms are better and healthier when young.*

Antidotes for Poisoning from Fungi.

In case of accidental poisoning from fungi, the symptoms usually are dizziness, nausea, purging, perspiration, with alternate cold spells. These generally appear soon after eating a poisonous fungus, say from one to five hours.

The simplest remedy, to he used at once: Two wine-glasses full of whieky and sweet oil (equal parts). At any rate use eweet oil liherally. Or give a strong emetic, after which give a purgative with one-half to one fluid drachm of ether in a glassful of weak hrandy or water.

Economic Value of Mushrooms.

A word now as to the economic value of mushrooms. The cultivation of mnshrooms in the region of Paris has arisen to great proportions. Ahont 70,000 pounds are daily produced, yielding nearly $2,500,000 per annum. One

proprietor, whose beds ars in tbe qnsrry at Merv, bas under cultivation over 21 miles of mushroom beds. Another at Frepillon one of nearly 20 miles. Besides these caves there ars many others at Moulineaux, Saint Denis, Mont Rouge and Vitry, and thie may serve to give some idea of ths extent to which the bueinese is carried on in that country.

Works on Mushroom Culture.

For a full acconnt of the methods to he pursued in cultivation, I would refer you to *Supplement No. 178 of the Scientific American;* also to Cuthill's "Treatise on tho Cultivation of the Mushroom," and "Robinson on Mushroom Culture," London, 1870; also, "Fungi, their Nature and Uees," by Cooks and Berkeley, New York, 1875.

The following list of worke may bs useful to those desiring to pursuo ths study of edible mushrooms: "Hymenomycetes Europæi," Elias Friee, od. 1874; "Outline of British Fungology," M. J. Berkeley (plates); "Hand Book of British Fungi," M. C. Cooke (illastrated); "A Plain and Easy Account of British Fungi," M. C. Cooke (plates); "The Esculent Fnaguses of Eagland," C. D. Badham (plates); "Mushrooms and Toadstools," W. G. Smith. Tbere are two large charts accompanying this oae of edible aad poisonous mushrooms. "Scottish Cryptogamic Flora," R. K. Grevillo, 1821 (plates); "Sowerby Colored Figures of English Fungi," 1797, 1815; "Iconographic des Champignons," Paulst (270 colored platcs), Paris, 1855.

The Engineer.

Giant Steamships.

For some years it bas seemed as if tbs limit of size in oceau etcamships was to be fixed at about 5,000 tons, It was clear that the *Great Eastern* was a gigantic failure, a costly elephaat on tbc hands of her owners. She could not bs rua as an ordiusry passenger or freight steamer, aad found only temporary employment in the work of laying subinarine cables. Whether shc can he utilized as a traasport for cattle to Europcan markets, as recently proposed, remaias to he proved; but it is certain tbat such a sbip would not be *built* for that purpose—or indeed for any other at the present time. She may therefore be left out of tbc account, except as a warning tbat tbere *is* a limit of size, at least so far as economy of construction and working is concerned.

Steamships of 5,000 toas have been running for eoms ten yeare or more, but their number bas increasod very slowly, and until witbin a year or two there has been no disposition to build larger vessels. Then came the *Gallia* of tbe Cuaard liae aad the *Arizona* of the Gnion line, the formsr beiag 5,200 and the latter 5,300 tons. The *Orient*, for aa East Indian line, soon followed, with a measurement of 5,386 tons. The euccess of tbese great ships, especially in regard to spesd, coupled with the ambition of companies to outdo their rivals, appears to bave given a new impulse to thie branch of naval architecture, and two sbips are now buildiag which ars to be much bigger tban the biggest of their predecessors. One of tbese is a Cunarder, and is to be of 7,500 tons and 10,000 horse-power, her dimensions beiag 500 feet in length, 50 fset in breadth 41 in deptb. No eooner had the Cunard Company announced their intention to build a vessel second in point of size only to the *Great Eastern* tban the Iadian Company determiaed to bave a steamship of even larger dimensions. The vessel is to he built at Barrow, and ie to hs of about 8,000 tons, but ber exact dimensions havs not heen puhlished as yet.

It may be iateresting to compare these ships with the *Great Eastern*. The length of ths latter on the water-liae is 680 feet, extreme breadth 82 feet 6 inches, and depth 58 feet. Her tonnage, according to builder's measurement, is 22,627 tons; hsr register tonnags, incluciag engiae space, is 18,914 tons; and ber register toanage excluding engine epace, is 13,343 tons. She bas stowage for cargo to ths extent of 6,000 tons, and the capacity in her coal bunkers is 10,000 tons. Her draft of water when ligbt, is 15 feet, and loaded 30 feet. She hes accommodation for 800 first-class, 2,000 secoad-clase, and 1,200 third-class passengers, but if required for troops alone ehe could carry 10,000 men. It will thus be seen that the *Great Eastern* is in point of size considerably ahead of anything yet ventured by shipowners, and though there is an evident desire to increase the sizs of ths great ocean steamere her position as the largest afloat is not likely to be disputed.

Railway Extension in India.

Witb the exception of the United States, and possibly France, no country of the world appeare to be so actively engaged in the extenеion of its railway system as India. It bas long been understood by those at the head of Indian affairs, that the stability of Eaglish dominion and the development of ths resources of the Indian empire are dependent upon a rapid extension of railways. Thsir great value during recent complications in Afghanistan bas ehown this. The interests of India, whether at war or at peace, demand increased railway facilities. Very little ie known in this country ahout tbe recent work done ia India in this direction, and it may be of iuterest to places before our rsadere eome facts drawn from a government report by Juland Danvsrs, for a copy of wbich we aro indebted to Meesrs. Matheson & Graat, engincers, London. On tbo 1st of January, 1878, India posecesed 7,220 miles of road, to which duriag thc year were added 995 miles, built almost exclusively by tbo state. On the 1st of Jaauary, 1879, 1,021 miles wers sither sanctioued or in course of construction, and it is more than probable that an equal mileage will be added dnring thc comiag yoar. The anaual consnmption of raile in that country for new lines will tbereforo not, in all probability, fall short of 100,000 tons, tbe greater bulk of which would be steel. In Jaauary of the present year more than 13,000 tons were shipped from Eaglaad to India.

Useful Information.

Artificial Fuel.

In France tbey use for fuel a material wbicb is ostensibly tablets of pressed peat, but which is more generally made of etable sweepiags, it is said. Similar *mottes*, made of camsl's dung, aro used for cooking in Algeria and all over the oasis of Sahara, for wood is thers too scarce to bs used for fuel. The motte makes a clear, odorless, eootless, and almost smokeless firc. All early overland omigraats to California must be familiar with the "buffalo chips" which formed such excellent material for fuel—they were natural mottes, similar to those above referred to.

Compressed peat in London, and indeed in a'l tbe large towns of Great Britain and Ireland, is rapidly coming into use. The cakes tbere are made in great blocks, while tbe French mottes ars only about six inches long by four wide and two thick. On tbe Bslfast and Nortbern railway of Ireland tbe compressed peat has heen tried with great eatisfaction. Tbe engineers report that 21 pounds of peat raises steam for a mile of transit, 26 pounds of coal being required to do ths same work. They prefer it, moreover, because eo clean to baadle and eo ligbt compared to coal. Its cost ie lese than one-half tbat of coal. "In tbe manufacture of gas," says our *Scientific American*, "as compared with coal, its illuminating powers are tested and put down at 342 to 100. So tbe rich and practically inexhaustible bogs of Irelaad promise to bring back prosperity to that country. The drying and compressing of this substaace render its transportation cbeap and easy, and as it is superior to wood in maay respects, and less expensive, tbere is no apparent reason why it sbould not bs very extensively used. A charcoal is also manufactured of the Irish peat, and the compressed cakee are in great demand for land fertilizing."

Rats.—Rats are a great nnisance in any house, and it is perfectly proper to war agaiast them in every conceivable way. The *Scientific American* gives the following method of riddiag a bouse of tbem. It has one advantage, that, if not successful, the benefit of cleanliness and disinfection ie at least eecured: "We clean our premises of these detestable vermin by making wbitewasb yellow with copperas, and covering the etones and raftsre in the cellar with it. In every crevice in which a rat may tread, we put crystals of the copperas, and scatter the same in the cornere of the floor. The result was a perfect etampede of rats and mice. Siace that time not a footfall of either rats or mics has been heard about the houss. Every spring a coat of the yellow wash is given the cellar—as a purifier, as a rat exterminator—and no typhoid, dyeentery or fever attacke the family. Many nersons deliberately attract all tbe rats in the neighborhood by leaving fruits and vegetables uncovered in the cellar, and sometimes even tbe soap is left open for their regalement. Cover up everything eatable in the cellar and pantry, and yon will soon have tbem out. These precautions, joined to the services of a good cat, will prove as good a rat exterminator as the chemist can provide. We never allow rats to be poisoned in our dwellings, they are so liable to die between tbe walls and produce much annoyance."

Imitation Stained Glass—A New Idea.—A few years ago stained glass windows were rare in this country, even in churches, except among tbe ambitious and costly of those of two or three denominations. Now ornamental windows are comparatively plenty, not only in churches, but in other public and private buildings, and would he more common in ordinary dwellinge wsre the cost within the ecope of ordinary purses. The growing taste for this sort of color decoration cannot fail to be materially advanced by the cheap and very successful imitation of stained glass effects now comiag into use. Thin sheets of silk paper sre printed with brilliant oil colors, in varied artistic patterns; and whea pasted upon common glass wiadows they produce all the brilliant effects of costly colored glass. The color sheets can be applied witbout skilled labor, and show a great advance in decorative effects over ordinary curtain shades or blinds. The inveation has been patented, and we predict for the product a large demand.

To Remove Old Paint from Wood.—A stroag aqueous solution of caustic potasb softens oil paint, which in this state may be removed by scraping. Tbe potash is, however, liable to injuriously affect the wood, aad must be used with great care, as to the strength of tbs eolntion.

Fire-proofing Cotton Fabrics.

In a paper on some conditions of inflammability, read before a sanitary convention in Michigan, Dr. Kedzie, of tbe State Board of Health, said tbat cotton clothing could bo prevented from takiag fire by the use of borax in starcbiag—a teaspoouful to each pint of starch, after the water has been added. The borax can have no iajurious effect upon tbe cloth or upon tbe wearer, and is so cbeap tbat all can afford to use it.

Dr. Kedzis showed by experiments that mnslins and tarletans, tbe most inflammable goods, when treated witb borax starch, could not be made to burn with a blaze. If all cotton dresses and underclotbiag, and especially tbe clotbing of cbildren, were treatsd in this way, a great number of lives and much suffering would be saved every year.

Dr. Kedzie said he expected tbat one of tbese days some sbrewd fellow would use this receipt, mix starch and borax, aad sell it as "asbestos starch," or witb some other catching uame, at 500% or 600% profit, and get rich out of it. The people could just as well do their own mixing and save the profit.

Brown Tint for Iron and Steel.—Dissolve, in four parts of water, two parts of cryetallized chloride of iron, two parts of chloride of antimony, and one part of gallic acid, and apoly the solution with a epouge or cloth to tbe article, and dry it in the air. Repeat this any number of times, according to tbe depth of color which it ie desired to produce. Wash with water and dry, and finally rub the articles over with boiled linseed oil. The metal thus receives a browa tint, and resiste moisture. The chloride of antimony sbould be as little acid as possible.

Fast Trains.—The Jersey City and Philadelphia train on the Pennsylvania road rune 89 miles in 111 minutes, or a mile in about 1.25 minutee. The Boston and Tannton train runs over tbe Old Colony road a distance of 34 miles in 47 minutes, or a mile in about 1.27 minutes; wbile 44 miles in 60 minutes, averaging 1.36 to the mile, are traveled by the Boston and Providence Sbore line express. These trains are among the swiftest in the world.

To Clean Wall Paper.—Soiled wall paper may bs made to look almost as well as new, in most cases, by the following expedient: Take about 2 quarts of wheat bran, tie it up in coarse flannel, and rub it over the paper. It will clean tbe whole paper of almost all descriptions of dirt and spots better than any other means that can be used. Some use bread, but dry bran is better.

Corks are made both air-tight and water-tight by being plunged into melted paraffine and kept there for about five minutee. Thus prepared, tbey can easily be cut and bored, and may bs inserted in or witbdrawn from bottles with great facility.

Good Health.

Danger from Bad Eggs.

At this season of the year it is often difficult to obtain eggs that are fresh unlese they are procured from soms farmer wbo will guarantee their freshness. During warm weather eggs speedily undergo cbanges akin to putrefaction. Tho shell but partially protects its contents from the destructive action of germs, unlese it is rendered impervious by the application of some substaacs capable of filling the pores eo that tbe air cannot pass through. An Englishman who has investigated the subject quite thoroughly, finds, upon microscopic examination, that stale eggs often contain certain peculiar cells of a fungoid character. These seem to be developed from the yolk of the egg, that portion which should furnish the material to form the flesh and bones of the chick which the egg would have produced by development under favorable conditione. Eggs containing tbese calls produced a poisonous effect upon dogs to which tbsy were fed. We knew a case in which a whols family were seized with violent purging in consequence of the use of stale eggs; at least the difficulty could bs assigned to no other cause.

Egge grow lighter as they grow older, by ths evaporation of tbeir fluid contents, causing the internal portion to shrink. Tbie leaves a small air epace at one end, which becomes larger as the egg is older, and if it is very stale it will float when placed in water. Such eggs should he discarded as unfit for food.—*Good Health.*

A Hint to Mothers.—A lady who expressed surpriss at seeing the children of a friend exposing themselves to taking a cold by recklessly wetting their feet, when asked if her children did not do the same tbing, aaswered: "No; I've managed to make my three hoys believe that it is vulgar and ungentlemaaly either to get their feet wet, or sit in a thorough draft, or bolt their food, or eat goodiee between their meals, or go to juvenile parties, poor dears. They're rather soft, perhaps, but they ars twice the size of any other hoys of their age, and they've never had an hour'e illness in their lives." Such motbers as tbis one are an honor to the world, and with more of them we should ses fewer sickly children and more robust onee.—*Herald of Health.*

Eye-Sight.

Milton'e blindness was tbe result of overwork and dyspepsia.

One of the most emiaent Americsn divines having, for soms time, been compslled to forego the pleasnre of readiag, has spent thousands of dollars in value, and loet years of time, in consequence of getting up eeveral hours before day, aad studying by artificial light. His eyes never got well.

Multitudes of mea or women bave made their eyee weak for life by the too free use of the eyesigbt, reading small print and doing fine eewing. In view of these things, it is well to observe tbe following rules in tbe use of the eyee:

Avoid all sudden changes between ligbt and darkness.

Never begin to read, or write, or eew for several minutes after coming from darkness to a bright light.

Never read by twilight, or moonlight, or of a very cloudy day.

Never read or sew directly in front of tbe light, or window or door.

It is best to have tbe ligbt fall from above, obliquely over tbe left sboulder.

Never sleep so tbat, on the first waking, tbe eyes shall open on tbe light of a window.

Too much ligbt creates a glare, and pains and confuses the sight. Tbe moment you are sensible of an effort to dietinguish, that moment ceaee, and take a walk or ride.

As ths sky is blue and the earth green, it would eeem tbat the ceiling sbould be a bluish tinge, and tbe carpet green, and tbe walls of some mellow tint.

The moment you are prompted to rub tbe eyee, that moment ceass nsing tbem.

If tbe eyelids are glued togetber on waking up, do not forcibly open tbem, but apply tbe saliva with the finger—it is the speediest diluent in the world—thsn wash your face and eyes in warm water.—*Exchange.*

Tbis hee been going around for abont ten years, and its ownership, we guess, is lost; bnt it is good enough to go on indefinitely.

The Uses of Lemons.—Lemons are easily raised in the southern part of the State, and if tbey possess half tbe virtues ascribed to them, no ono should fail to plant a few treee wherever tbsy will grow. An exchange eaye: "Lemon jnice is the best antiscorbutic remedy known. It not only cures the dissase but it prevents it. Sailors make a daily use of it for this purpose. A physician suggests rubbing of the gums daily with lemon juice to keep them in health. The hande and nails ars also kept clean, white, eoft and supple by the daily use of lemon instead of soap. It aleo prevents chilblains. Lemon is used in intermittent fevers mixed with strong, bot black tea or coffee, without sugar. Nenralgia may be cursd by rubbing ths part affected with a lemon. It is valuable also to cure warts, and to destroy dandruff on the head, by rubbing the roots of ths bair with it. In fact, its uees are manifold, and the more we employ it externally the better we shall find ourselves. Natural remedies are ths best, and nature is our best doctor, if we would only listen to it. Decidedly rub your bands, head and gume with it, and drink lemonade in preference to all otber liquors." Lemon juice ie also said to be an antidote for enake poison by pressing the juics into the bits and by eating the lemons. Many testify to the heneficial effects of lemons in pulmonary diseases, and consumptives have been cured by eating tbem freely every day. They will give immsdiate relief to tbe most troublesome corns and cure them if their use is persevered in. Hot lemonade is the pleesantest remedy known for colds, and lemon pie for hunger.

Injurious Effects from Vulcanite Plates. Samuel Sexton, M. D., in an article publisbed in the *American Journal of the Medical Sciences*, for Jaauary, 1880, states that vulcanite platse produce diseases that are more frequently the source of reflex aural disease than any otbers worn. Thsy have heen in nse for over 20 years, and tbeir adoption is very general. Tbe constituents of thie are caoutchouc, the sulphur rsquired in the vulcanizing process, the vermilion or the sulphide of mercury, used for the color it imparts. The quantity of the latter ingredient is believsd to be equal in weight to both the other substances mentioned; accurate knowledge, however, is withbeld by the manufacturers. The gradual disintegration of theee plates, as they are worn in the moutb, liberates a salt of mercury, whose poisonous effects ars well known. But besides yielding a poison, they are otherwiee injurious to health. Inquiries from dentists elicit the fact that at lsast one-tbird of all those who attempt to wear them experience great irritation of the mouth, an irritation that is frequently accompanied by hypersecretion of the huccal fluid. The sufferer usnally lays aside the plate until informed of ths necessity of becoming accustomed to its presence by uninterrupted use. Vulcanits is a nonconductor of beat, and the effect of its contact with the higbly sensitive tissues of the moutb is to produce hyperæmia and inflammation. Another source of iajury is the very close contact of these plates, which is maintained by atmospheric pressurs, and may favor the absorption of their substance.

Fainting at Sight of Blood is due to a very sensitive temperament, and an organization lacking in courage and stamina are at the bottom of this weakness. Lose of blood, in the mind of some, ie associated with suffering and death, and a dread of thess bas eomething to do with the faintnees.

The Week.

The rain has besn falling steadily during the week, making the hearts of both miners and farmere happy. There ie now every prospect of a good mining season and plentiful crops this year. To these two industries California looks for the bulk of her production, and when times are hard with them they are hard with all.

The mining excitement throughout the United States still continues, although in New York they have had a little "set back" in the Little Pitteburg of Colorado, which will scare some of them out of investing in stocks of mines. They ought to look more to dividende for profits, than to rise in value of etock.

It is worthy of note this week that, on looking over the papere published in the Territories, we see that there seems to be a regular "rush" of miners and prospectors. People are arriving by the hundreds and scattering over the hills in eearch of ore. Arizona will be well prospected this summer. Then will come New Mexico'e turn, where there ie room for many thousand miners.

This week closes the work of the Legislature, which, although it has accomplished a great deal of work, has not done so much as was expected, since many bills could not be reached.

THE Committee on Public Buildings and grounds of the House of Representatives have agreed to recommend the passage of a bill providing for the erection of a public building at Sacramento at a cost not to exceed $100,000.

THE six day walking match at New York cnded Saturday night, Hart being the winner, making 565 milee—beating the heet time on record.

A MILL is to be erected at Oroville for the purpose of extracting gold from the tailings by the Edison electro-chemical process.

DURING the firet three months of 1880 thers were 1,400 business failures in the United States, with liabilities of $12,000,000.

THE charges preferred against Judge Silent, of the Arizona Supreme Court, are scouted by the papers of that Territory.

THE gross earnings of the Central Railroad of New Jersey in 1879 were $7,000,000, against $5,500,000 in 1878.

The State Mining Bureau.

Assembly bill No. 415, better known as Wasson's Mining Bill, which provides for the establishment and maintenance of a State Mining Bureau in San Francisco, has passed both houses and gone to the Governor for signature. We have before this given the provisions of the bill in full.

It provides for a State Mineralogist, who is to collect and preserve, in San Francisco, geological and mineralogical substances, mineral watcrs, etc., properly identified and labeled, not only from this State but from others. The Mineralogist is to hold office four years and receive $3,000 per year and his traveling expeuses. When the funds in the Mining Bureau are sufficient, he is to provide and maintain a library of works on mineralogy, geology and mining, models and drawings of mining machinery, milling machinery, etc.; to correspond with established schools of mining and metallurgy, and obtain and preserve for public inspection such information in reepect to mining and milling machinery as will be practically useful to the people of the State. He is to visit the different districts of the State from time to time, and at the close of each year make a report to the Governor. Hs may appoint assistants, fit up rooms, etc., all to be paid out of the Mining Bureau fund, which fund is to be derived from the proceeds of taxes on mining corporations, milling compauies, ditch companies, etc.

We should have been hetter pleased to see the collection of information and etatietics come first, and that of geological and mineralogical specimens come last. The miners want information more concerning mining and milling than they do concerning minerals. Under the provisions of the act, however, it seems as if the mineral collection will be made first, although its greater or less prominence will no douht depend greatly on the person who is appointed by the Governor to take the position of State Mineralogist.

As we have before remarksd, a bureau of information concerning miniug matters is eadly needed here, and this is the first step which has heen taken hy the State in that direction, for which Mr. Waeeon deserves the thanks of the mining community. We still hope, however, that the collection of minerale will not be carried on to the exclusion of other work which will he of more value to the practical miner. The State has now large collections of geological and mineralogical epecimens at the Universsity which are ready for reference.

This Bureau can be made of a great deal of henefit to the mining community, if carried out by competent men having knowledge of mining mattere.

Nerve in Mining Matters.

There is a leeson in the collapse of the Little Pittsburg mining echeme aside from that which tsaches "all is not gold that glitters." It is that it takes some experience in mining affairs for the acquirement of that holdness and nerve which it takes to conduct them on a large scale. Private letters from New York etate that the mining fever has very greatly eubsided eincc the eudden fall in the stock of the Little Pittsburg, and several papers which have slightly encouraged mining investments, or rather said uothing against them, have come to the front condemning the whole buineee.

This was to have been expected. The people who have been dealing in railroad and manufacturing enterprises, and unaccustomed to a sudden drop of one or two hundred per cent. in their "security" would naturally become very much alarmed. On this coast, where we are used to such things, it would have made no great impression. The holdere of etock would have thought themselves out of luck, but would not on that account have determined to eschew mines forever after.

The rich men of California, who havs made their money from mines and mining stocks, have acquired by experience the nerve to take hold of minee, and where they lose in one instance they make it up in another. They know how to opcn and develop the mines, and to manage them afterwards. They do not manage their mines on a "picayunish" scale, but put their money in generously, with the hope and expectation of a generoue return. At the eame time, the Little Pittsburg matter may he useful to the Eastern mining investore. It will teach them not to look at etock values alone, as they fluctuate widely at times, while the real value of the mine they represent may remain the same. If a mine has no ore, it is of course worthless, while, at the eame time, the stock may be held high for the time. Again, the etock may be low, when the mine is really valuable. If they look to the proceeds from dividends as ths legitimate fruits of investment, rather than that gained from the fluctuation of stock, they will be ever eo much better off, as our experience here in California has abundantly proven.

GEN. HATCH has had a fight with Apaches in the San Andreas mountaine, New Mexico, which lasted six hours, and resulted in ths rstreat of the Indians.

The Mining Laws.

All our exchanges published in the mining districts of this and adjoining States and Territories are publishing articles from correspondents in their vicinities, condemning the proposed charges in the mining laws. Petitions to Congress asking that no changes be made are heing rapidly circulated and signed. We see that Senator Farley this week presented to Congress a memorial numerously signed by citizens of Mono county, Cal., and Esmeralda county, Nev., protesting against the paseage of the Public Land Commissioner's bill. The memorialiete say the enactment of thie bill would be eubversive of the hest interests of cheap mining; that instead of preventing litigation, it will increase litigation; that by its onerous conditions it will create a necessity of capital with which to do even surface mining; that it will entirely destroy the occupation of the proepector, throw thousands of poor miners and hardy prospectors out of employment, and retard for an indefinite period the development of a comparatively unprospected mineral helt which is believed to be rich in precious minerals. Representative Daggett has also received a large number of memorials of the same character.

In view of the great number of memorials on the subject and the expressions of the press, it would eeem ae though the Land Commiseion would recognize that they had made n falee etep, that they had taken up a subject superficially which required more care and thought than they had given it. We are glad to know that uothing will be done by Cbngress on the matter during the preseut season; since before the next season the whole eubject will be fully discussed and better understood. There will then be no danger of such radical changes being made as the hill proposes.

Death of Pioneer Miners.

The well-known mining prospector, Capt. John Moes, died in this city ou Sunday last, of a gunshot wound received from an Indian in the southern country. Deceaeed was familiarly known in all mining camps in the Pacific States, the Territories and Mexico. He was a prominent Mason, and received the wound which caused his death while protecting a hrother Masou from the aseault of an Indian. He came to thie city for treatment, ths ball having lodged in the lung, and euffered through a protracted illness.

O. P. Calloway, one of the pioneer ditch buildere of the State, was recently killed in Arizona. He wae connected with mauy ditch and canal huildiug enterprises in the mining counties of California.

James Barry, the man who etruck the ore channel in the Table mountain, Tuolumne county, the first discovery of the kind in the State, is dead. He came to California in '49, and engaged in mining on Mormon gulch, and was among the early prospectors in many localities in Tuolumne county.

J. A. Bonnefoy, a resident of Tuolumne county since 1851, has just died, and the *Independent* tells of him an example of perseverance and faith. He, in company with Felix Obnr, another Frenchman, have run over 2,000 feet of tunnel in prospecting Table mountain, mostly through basaltic rock formation. Thie work has extended through a period of ten yeare, almost without intermission, Bonnefoy furuishing the money and Obar the muscle. Several years ago they etruck a channel which prospected well—having given up the idea of cver finding a "back channel." They had recently gone to work and were taking out gravel to wash from their first find at the time of Bonnefoy'e death. Very few men, under euch adverse circumstances, would have stuck to the work eo long.

Another "Process" Failure.

The section around Grass Valley and Nevada City, which has become the "bone-yard of processes," from the fact that so many have heen tried there and failed, has now another fizzle to add to the list. The Murchie company, of Nevada City, a few months ago erected worke for the purpose of reducing their sulphurets by amalgamation, by a procese invented hy J. H. Smith. About $8,000 were expended in buildings, furnaces, apparatus, etc. We gave an account of the experiments when they were first tried. The Nevada *Transcript* now eays: "After a brief trial, the procese wae demonstrated a failure, and Mr. Smith, at whose recommendation the experiment is eaid to have heen made, was 'fired out' of the camp in a hurry. The company are still sending their sulphurets to San Francisco for treatment, ae formerly. They now contemplate reconstructing the works so ae to use the chlorination process, which after many years' teste nppears to be the best yet discovered. This latter change will entail an additional expense of some $2,000 on thc company, hut if rightfully managed it will afford them sure and profitahle means of extracting the gold from their ores."

THE Panama Railroad Company havs declared a dividend of 4 per csnt.

Low Grade Ores.

It is not by any means always the case that the high grade ore mines pay the best. Usually when it is pretty high grade, there is not so much of it; and there beiug less, the quantity taken out costs more in proportion to extract. A mine with a good fat ledge of medium or low grade-ore and plenty of it, is a much more eatiefactory piece of property than one with hunches or patchee of very rich ore, or a thin ledge. Of the many hundrede of mines we hear of with ore assaying into the thoueands, how few there are which ever amount to much permanently or ever become great mines. When a man finds a claim and takes out a few pounds of rich "specimens," he has by no meane made hie fortune yet. Ore that assays $5,000 and $10,000 per ton, as a general thing doee not "stay." Ore assaying $10 or $20 per ton, in a gold country is very much more likely to pay best in the long run.

The "glittering ore" that we read about is not always the beet to find. Specimene of "free gold ore" are very handsome to look at, but much scarcer than that which ehows no eigns, but holds it none the less.

Until within a ehort time the miners in this State have devoted their energy too much to hunting for high grade ores only. Now, however, ledges of fair eize that will run from $7 to $14 per ton are not by any means conaidered worthless. With all the improved appliauces for heneficiating ores, and the long experience of the mill men, this clase of orca will pay very well indeed. In fact the mines of this class are really much better than the rich "knife hlades" or pocket leads, so much sought for of old.

Capitalists would rather iuvest money in putting up works on a mine with an abundance of medium or low grade ore, than in one with a scant quantity of very rich ore; and the very rich ore ie always scarcer than is eatisfactory. Prospectors should bear these facte in mind, and not pass over as worthless a claim which doee not at first show ore which is ae rich as they would like to see.

Legislative Matters.

Senate bill No. 482, for the hetter preservation of fish by providing and maintaining fish screens at the heads of mining and irrigating ditches, has heen passed.

The following bill, passed by the Assemhly, will prohably bo passed by the Senate: Water-ditchee constructed for mining, manufacturing or irrigation purposes, and wagon or turnpike, toll-roads or telegraph lines, must bs assessed the same as real estate hy the assessor of the county, at a rate per mile for that portion of such property as lies within his county.

Waseon'e Mining Bureau bill, elsewhere referred to in thie iesue, has passed both houses.

The long-discuseed debrie and drainage bill has finally passed and now goes to the Governor for signature. In the Senate the amendment to Section 5, providing for the appointment of a resident engineer in each drainage district, was concurred in.

The amendmente to Sections 16 and 17, fixing the district levy at one-twentieth of one per cent., instead of using the worde, "not to exceed," was finally concurred in.

The other amendments relative to using all moueys raised under the act for impounding the debris, etc., were concurred in without debate.

Braunhart's bill to suppree etock gambling, when it came up in the Senate, was vigorously diecueeed. Neumann, Sears, Hittell and Conger made vigorous speeches in opposition. They pointed out what they called the moustrous proviciens of the measure, which clothed the Mining Commissioner with unlimited power to open the way for the formation of the most powerful stock ring that could he organized. Neumann also pointed out a provieion requiring the mining corporations to make a weekly report every month, and Sears showed that the bill required a etock hroker who failed to give a bond for the collection of licenses to be sued on hie bond.

The bill wns defeated, not receiving the constitutional majority—ayes 17, noes 16.

CAVE CREEK, ARIZONA.—Great activity prevails in and about the Rone gold mine. Ths ledge is nearly eight feet in width, in ore which averages over $100 to the ton. Cave Creek district is very lively in consequence. Several mines have been eold and bonded recently. Proepectors are arriving daily from California, Arizona and Nevada. All are well pleased with the outlook of the new camp. Gen. Vernon is Superintendent. The smalleet mill is to he erected at the mine, the larger one on Camp creek, eome three miles from the property. This valuable mine was recently purchased from the Rone and Regan families by Generals Crook, Kautz, Vernon aud Messrs. Snider and Gibson, of California, who are exceedingly pleased with their investment, and are satisfied that the property is *immensely rich*. The ledge rune north and south, granite formation, and has fine clay seams on the hanging and foot wails. Good judges pronounce *it a true fissure vein*, and one of the moet valuable mines ever opened on the Pacific coast. It is certainly very rich in free gold; only traces of silvsr; no rebellious mstal whatever.

Mines and Mining in Nevada County.

As is probably well known to most nf nnr readers, Grass Valley claims the distinction of having bcea the place at wbich quartz mining and milling wcro inaugurated in California. Tbnt the first gold bearing veins in the State were here discnvered, located nnd opened up admits of no qucstion; it being nearly as well settled that the pioneer crushing mill nn the Pacific coast was built and commenced operatinn nt this place. When the writcr arrived on the spot where the town of Grass Valley now stands, in the month of Marcb, 1851, there were already three establishments nf this kiud in nperation here, Judge Walsh having put up tbe first one the preceding winter. There was at that time considernble excitement on tho subject of quartz, many of the gold diggers having abandoned the placers for the purpose of engaging in this brnnch of mining. For a while, and until the stubborn sulphuretcd ores were reached, the business paid fairly. After that it fell into decadence, only such lodes as afforded tolornbly free milling ores continuing to pay for working. Of these, however, there were a number, some of which have, through their large and profitable production, come to rank among tbe historical mines of the State. In this category stand

The Allison Ranch, the Eureka and the Idaho,

All of which have distinguished themselves in this respect. The Allison Ranch from 1856 to 1867 inclusive, turned out gold bullinn to the value of $2,300,000. This production was made from 46,000 tons of ore, wbich yielded at the average rate of $50 per ton. Of the above total about two thirds were net profits. The Eureka, during the 12 years preceding, Aug., 1877, produced something over $4,600,000, of wbich $2,134,000 were disbursed in dividends, the ore from this mine having averaged nearly $50 per ton. The pay chimney in the Eureka having been exhausted several years ago, the work of exploring for new ore bodies, kept up for some time after, was finally given up, and the mine may now be considered abandoned. The gross product of the Idaho mine for the past 11 years approximates $6,000,000, of which nearly one-half has consisted of net earnings, while it has turned out a vastly greater quantity of ore than either the Allison Ranch or the Eureka, the Idaho ore has been of much lower grade, having averaged only about $20 per ton. The average of the 32,370 tons worked last year was but $15.42 per ton, the cost of mining and milling having been $8.42 per ton. Tbis mine is now opened to a depth of over 1,100 feet, and the ore is said to be improving both as regards quantity and grade. The company are running 35 of their 50 stamps. Among other of the

Older Claims in this Neighborhood

That have in times past made a creditable record, the Empire, North Star, Gold Hill, Massachusetts Hill, the Houston, Osborn, Cambridge, the Providence, the Banner and the Soggs are prominent, the production of some of tbese having run up into the millions. The most of them have had a somewhat cbequered career however, the ore here occurring largely in pockets, chimneys and other capricious forms, the exhaustion of which has tended to continually vary the fortunes of the mines. In some cases the fluctuationa experienced have been due to causes not connected with the character of the ore bodies. The Gold Hill mine, the first ever discovered here, turned out, during the 14 years it was actively worked, over $4,000,000. Sometimes the ore would be so interlaced with gold that it had to be crushed in hand mortars, and then for a time it would be too poor to pay current expenses; the most profitable mines here in the long run having been those in which the ore showed very little gold to the naked eye, such as the Eureka, Murcbie and Idaho. The Massachusetts Hill mine, supposed to be on the same lode with the Gold Hill, has yielded nearly as much as the latter. A very mournful event is connected with the early history of this mine: Michael Brennan, who had been engaged as superintendent, opening it for the Mount Hope, an Eastern company, failing after several years' labor to develop anything of value, in a fit of despair poisoned first his wife and three children and then killed himself with a pistol. This occurred in 1858, and within a year or two after a very valuable body of ore was opened up only a few feet from the bottom of the shaft where the unhappy man had done his last work prior to a final suspension of operations. Had he continued sinking another day he would probably have struck into this rich ore and thus bave saved the property to his employers and saved himself and family from their pitiful fate.

It is a Noteworthy Fact

Connected with tbe history of the mines here that the district has never been without one or two largely productive properties. From 1851 to 1855 there were not less than a dozen claims that yielded remarkably well. In the latter year the Allison Ranch mine commenced to make bullion freely. A year or two later, and before it began to wane, the Eureka was in the ascendant; and long before this famous old mine had been exhausted of its ores, the Idaho came to the front; and now, as its contents undergo gradual impoverishment, there are still a number of mines in course of exploration, either of which promises to well nigh and may even more than fill its place of these new aspirants to distinction.

The Providence

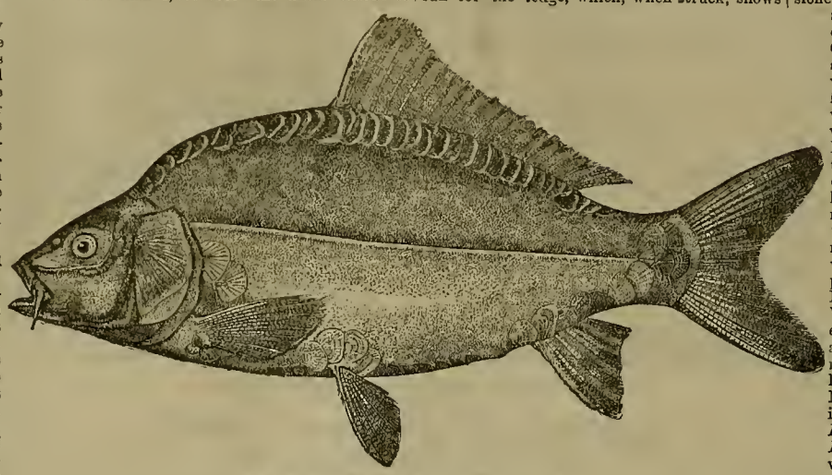
Claims first our attention, both because of the many difficulties with which the owners of the ledge have had to contend, on account of the refractory character of the ore, and of the rich developments lately made in its lower levels. This mine, which has been in course of exploration for many years, has been opened with system and thoroughness to a depth on this incline of more than 1,000 feet—the lineal extent of drifts, drains, tunnels, etc., run in the course of explorations amounting to some 12,000 feet. Five ledges, varying from 3 to 14 feet in thickness, have been opened up, and as much as 500,000 tons of ore developed in the mine, two-thirds of which will pay a good profit on reduction. There are at present only about 40 tons of ore being extracted from the mine daily—sufficient to keep the 20-stamp mill of the company employed. The number of stamps are to be increased to 60 or 80 the coming summer, after which the quantity of ore reduced will be increased in like ratio. The bulk of the ore here is combined with sulphur and other refractory minerals to an extent that necessitates roasting and the employment of the chlorination process for its effectual reduction, this method having been found by the owners of the mine the most satisfactory, after nearly $100,000 spent in making trial of other plans. The Providence is a big mine, with a prosperous future before it, and, as the company have evinced a commendable spirit of enterprise, as well as shown a wonderful degree of perseverance and patience, many will rejoice at the promising aspect of their affairs.

The Old Murchie Ground,

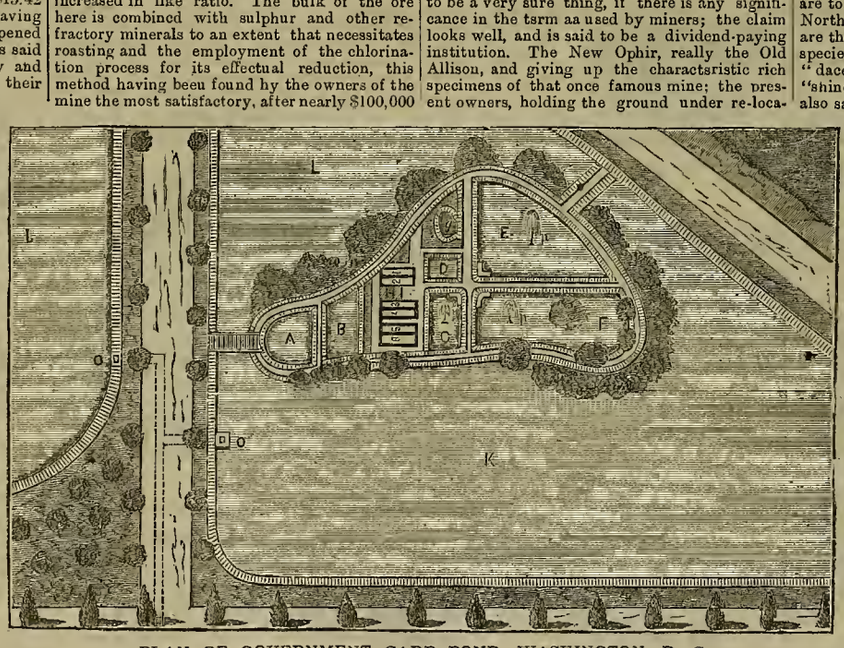
Situated near Nevada City and five miles northeast of that place, under the application of steady work is growing into a good property, ore extraction and reduction, exploration, mill building and various other improvements having been in progress for several years; to these there is now to be added hydraulic washing, there being extensive banks of good gravel on the company's lands with three ditches constructed for bringing water upon them. These gravel deposits are already opened and outfitted with pipes, sluices, etc. The quartz lodes, of which there are several, have been well opened and furnished with a crushing mill of large capacity, concentrators, chlorination works, etc. They have here large quantities of ore that will yield from $8 to $10 per ton in free gold, besides nearly as much more contained in the sulphurets.

Among the Notable Mines Hereabout,

But belonging to developments of a later day, we have, first, the Live Yankee, now called the Fortuna, an active, thrifty concern, as its double name denotes. This claim is located on the same lode, or at least stands in the same mineral range, as the Providence mine, from which it is not far distant. The lode on which it is located having been traced by its croppings a distance of four miles, has since been identified throughout by exploratory work done continuously along it. Work on this ground is being prosecuted vigorously, a vertical shaft having been put down and drift from its bottom run for the ledge, which, when struck, shows great strength, and is well stocked with high grade ore, even better than was found at points above. The property is owned by strong parties, and can hardly fail to develop into a first-class mine. In this category we have also the Alpha, situate near and running parallel with the prosperous Idaho, the Kirkham & Hitchcock claim, a recent discovery, yielding rock so exceptionally rich that the owners realize big wages working it with only an arastra and hand mortar; the Mohican, turning out ore that goes about $30 to the ton; the Deadwood, that ought to be a very sure thing, if there is any significance in the term as used by miners; the claim looks well, and is said to be a dividend-paying institution. The New Ophir, really the Old Allison, and giving up the characteristic rich specimens of that once famous mine; the present owners, holding the ground under re-loca-



THE EUROPEAN CARP—Ciprinus Carpio.



PLAN OF GOVERNMENT CARP POND, WASHINGTON, D. C.

The European Carp.

Recently we promised our readers plans and descriptions for making carp ponds. As an introduction to this practical information, which we hope soon to present, we give in this issue a picture of the true European carp *(Ciprinus carpio)* and a view of the Government carp ponds at Washington. For these engravings we are indebted to the *Semi-Tropic California*.

About the time that carp were brought to this State by the enterprise of Mr. Poppe, of Sonoma, there was also inaugurated a movement on the part of the United States to secure the fish for general distribution throughout the country. In 1876, Prof. Baird, United States Commissioner of Fisheries, having for a long time understood the importance of acclimating the carp in this country, engaged an eminent German fish-culturist, Dr. Rudolph Hessel, to bring over a supply of the best varieties of this favorite European food-fish. The first experiment, in May, 1876, was unsuccessful, and out of 300, with which he started, only four survived. In May, 1877, Dr. Hessel returned from a third trip, bringing to New York 345 young carp, 227 of which were of the varieties known as the "leather carp" and "mirror carp," and 118 of the common or "scale carp." They throve and increased rapidly in size, and in May, 1878, 120 were removed to the Government carp ponds, built for them on the Washington Monument Reservation, in the city of Washington. These ponds, a plan of the essential portions of which is given below, are constructed after the best German models, and cover about twelve acres of land, in the vicinity of the Washington Monument. The letters upon the engraving are interpreted as follows: *A, B, C, D, E* and *F*, hatching ponds; *G*, turtle pond; *H*, watch house; *J*, cast pond; *K*, northwest pond; *L*, southwest pond; *O, O*, outlets; *P, P*, fountains.

The carp have now multiplied to such an extent in the Government ponds that it is possible to begin the work of distributing them. The introduction of this new food-fish will be of great interest and importance to all inland communities; for there is no ditch, pond, or mill dam, or any boggy, muddy spot, which can be converted into a pond, in which they will not thrive. It will be strange if, within twenty years, carp do not become as common domestic animals as ducks or pigeons.

The carp belongs to the family known to naturalists as the *Cyprinidæ*, members of which are to be found in every stream and pond in North America. Good examples of this family are the common goldfish, and the familiar brook species known everywhere by such names as "dace," "chub," "red-fin," "fall-fish" and "shiner." The "Buffalo-fish" of the West is also said to resemble it in many respects. The carp, however, is the king of his tribe, and those who know, do not hesitate to say that, as a food-fish, it far excels the best of them.

The carp has other and strong recommendations: It is, of all fish, the most readily propagated and reared. It has been domesticated in Europe from time immemorial, having been introduced many centuries ago from Central Asia or China, where it is native. Carp soon become tame and eat from the hands of their keeper. Dr. Hessel handles those in the Government ponds as if they were tame kittens, and says that they come to him when he whistles. Their fecundity is great. A fish weighing four or five pounds lays 400,000 to 500,000 or more eggs, and one of ten or fifteen pounds about 1,500,000. In Middle Europe they spawn from May to August, and the breeding season appears to be nearly the same in Washington. In 1879 they spawned here from June to September. The eggs are sticky, and cling to plants and twigs, hatching in from nine to eighteen days, according to temperature. The actual rate of increase is very great, owing in part to the fact that the parents do not devour their young. The one hundred and twenty fish brought to Washington two years ago have increased to, at least, twenty thousand. It is thus able to populate a body of water to the fullest extent. Unlike the majority of American food-fishes, their diet is largely vegetable, and they are particularly fond of water-cresses and other juicy plants. They also devour worms and insect larvæ, which they root out of the mud, and all kinds of refuse matter, such as the offal of kitchens, slaughter-houses and breweries. By reason of these habits, they are harmless to other fishes inhabiting the same waters.

The carp is adapted to very varied climates, and will thrive under conditions unfavorable to any equally palatable American fish. It is very hardy in all stages of growth.

When we take up the subject of constructing carp ponds, which may be in our next issue, we shall speak of the situations and conditions favoring the growth of the fish.

THE Clayton steam pump and air compressor works of Brooklyn, N. Y., have within the past six months enlarged their shop, increasing its capacity some 50%, and for some time past has been obliged to employ another shop exclusively on air compressors for mining purposes.

FOUR HUNDRED human beings have been offered up in Mandalay as sacrifices.

AN earthquake occurred at San Buenaventura Sunday morning. It was felt also at Riverside and San Bernardino.

Price of Water for Irrigation.

Complying with the provisions of the new Constitution, and before legislative action was taken to enforce its provisions, Supervisors in one or two counties met in February to fix the rates for water sold by water companies for irrigation and other purposes. In a number of towns similar action was taken. The matter has just been given definite shape by a law prescribing that this year the water rates must be established at the first session of the Supervisors after its passage; in future years the action must be taken during February in each year. The following is the new law:

An act authorizing the Board of Supervisors of the counties in which water is sold for the purpose of irrigation, to fix the rate at which water is sold, approved Mar. 26, 1880.

SECTION 1. The Board of Supervisors of the several counties of this State in which water is appropriated, furnished and sold principally for the purpose of irrigation, are hereby authorized and required to fix the maximum rates at which such water shall be furnished and sold, at a meeting, to be held in the month of February of each year; provided, that in the year 1880 such rates shall be fixed at the first meeting after the passage of this act. The rates so fixed and established shall be in force from and after the first day of July, after the date of fixing said rates, and shall continue in force for the period of one year; provided, that nothing in this section shall apply to water furnished within the limits of any incorporated city and county, city or town.

SEC. 2. Any person, company or corporation collecting rates for water furnished for irrigation in any county in this State in excess of the rates as provided in Section 1 of this act, shall forfeit for the public use the franchise and water works of such person, company or corporation to the county in which such excessive rates were charged.

SEC. 3. Upon affidavit being made by any interested party, setting forth that any such company, person or corporation has charged rates for water furnished for irrigating purposes in excess of the rates established by the Board of Supervisors, the said Board of Supervisors shall cause the District Attorney to commence an action in the Superior Court of the county, within 30 days from the receipt by them of the affidavit, to enforce the forfeiture of the franchise and water works of such person, company or corporation.

SEC. 4. If the Board of Supervisors fail or neglect to fix the rates, as provided in Section 1 of this act, or if the Board of Supervisors fail or neglect to commence the action provided for in Section 3 of this act, as therein provided, any interested person may commence proceedings to compel the performance of such duties.

SEC. 5. No person, company or corporation selling water for irrigation shall be permitted to exercise any control as to the use of the water after its delivery to the purchaser.

SEC. 6. This act shall take effect immediately.

Business Directory.

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.
For circulars and prices apply to

W. BRUCKNER,
Mining Engineer,
328 Montgomery St., room 16

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

Howland's Under-current, Mill and Sluice Riffle.

This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter.*

CONTINUED FROM PAGE 245.

site side, and it is a thicker layer. The granulated carbonate, the kind you can shovel out, has been found in the latter named discovery, in small quantities, however; but where there are small pockets it is believed larger ones also exist.

HIGH.—The High Lode, Col. Elliott's mine, is keeping up its lick. An 11-day run of Elliott's 30-stamp mill on ore from the High Lode, produced a $10,000-retort, which was on exhibition at the Merchants' National bank yesterday.

CALEDONIA.—The Caledonia 60-stamp mill will start up to-day. It is thought that hereafter the stock owners in this company will receive dividends instead of paying assessments.

SPEARFISH DITCH.—The work is now being pushed as rapidly as possible; over 30 men have been constantly employed all winter putting together the flume, and by the 25th of this month, 5 miles of the flume will he completed, and, in a great portion of this distance, 10 inches in depth of water has been running all winter, and has never frozen up as yet. There has been a great deal more work done on this side of the Spearfish than has been done on the other, in the way of grading and tunneling, and on the 1st of May the management propose to put a large force of men at work on all that portion that has not been prepared for the flume. The first 10 miles of the ditch is through a limestone formation, and in this portion the flume will be uncovered, and from the experience of the past winter it is safe to presume that the water will not freeze. The remaining portion of the distance runs through a slate formation and in this part the flume will be covered. This ditch takes the water from the north fork of Spearfish, and in its course crosses several smaller streams, all of which afford water that will make at the lowest stage all that the flume can carry, and the flume is 30 inches square. This ditch, when completed, will add more to the permanent wealth of the county than would the erection of a 500-stamp mill.

MONTANA.

GAYNON.—Butte *Miner*, Mar. 23: The shaft has a depth of 245 ft. It is being sunk on the hanging wall. On the 225 level the crosscut from the shaft is still being pushed forward. The west level is in 40 ft from a point in the crosscut 25 ft from the shaft. This level is on the hanging wall, from which crosscuts will be run for taking out ore. The ore at present taken from the upper levels is of very high grade, and, besides the silver, carries from 15% to 20% copper.

ANGLO-SAXON.—The incline shaft has a depth of 100 ft. A level has been run east 65 ft and west 00 ft. In the east level a 6-ft vein of base ore is being extracted; in the west the vein is reduced in size, but the ore is of improved quality.

MOOSE.—The ledge continues strong and well defined, and in the face of the north level a 2-ft vein of magnificent looking base ore is being extracted, assaying upwards of $200 per ton. Midway between the face of the level and the shaft an upraise has been started, showing up a 4-ft vein of excellent ore. From the bottom of the 80-ft shaft, a crosscut was run west, which, at a distance of a few feet, uncovered a well-defined vein of ore of much richness. A level has been run on the vein, 35 ft in length. The ore is of 2 kinds, some being free and some base. The streak of the former is 18 inches wide, and assays 92 ounces in silver per ton. The base ore is much richer. The streak will average 2½ ft in width, and assays 282 ounces.

GRAY ROCK.—The west level, 70 ft from the surface, is in 180 ft. It is impossible to estimate the amount of ore in sight, as no crosscut has been run; but a breast of base ore, assaying $40 per ton, has been extracted from one end of the level to the other, and not a pound of waste is visible in its entire length. It is undoubtedly one of the largest ore bodies in the district.

SUNNY SIDE.—The vein runs vertically into the hill, and is penetrated by a shaft 70 ft deep. From a point 30 ft below the surface, a level was run 80 ft west, from which 200 tons of free milling ore of fair grade have been extracted, leaving a considerable body yet in sight. The second level running west from the bottom of the shaft is in 50 ft, showing an improved quality of ore carrying a light percentage of copper. Two assays of ore from this level show 78 and 156 ounces in silver.

HORSE PLAINS MINES.—Helena *Independent*, April 10: The latest mining excitement is in the direction of Horse plains, at a point near the head of Thompson river, and about 100 miles from Missoula. The camp is called Maginnis gulch. A large number of claims have been staked, but no work can be done yet on account of the snow which is several ft deep. Fair prospects have been obtained, and it is believed that gold in paying quantities will be found in that vicinity the coming summer.

YOGO.—There are many conflicting reports concerning the extent and richness of the Yogo mines. The reports lately received and particularly those which seem to be the most trustworthy, are not such as to justify the high expectations that were first had with reference to them. Certainly nothing has thus far been discovered, of such value as to cause anything in the nature of a stampede. The indications at present are that a few of the claims may pay reasonably well when bedrock shall be reached, and some of the claims may prove to be very rich. But reaching bedrock seems to he a difficult and expensive matter, so that only men of means can, in the present condition of the camp, afford to make the experiment.

OREGON.

MINING ITEMS.—*Oregon Sentinel*, April 7: Miners on Foots creek are all busy yet, with every indication of a good clean-up. Kahler, McDonough & Co. have resumed ground sluicing in the Fort Lane diggings. T. L. Beck, of Willow springs, is again ground sluicing. The Squaw Lake Co. are moving much dirt that prospects fairly and have plenty of water. Sam Lackland, of the Palmer Creek mine, is piping night and day, gravel looking well and water flush. The Applegate Gravel Co. are preparing to start in on a new and more favorable location, where they will have more dump. Barkdale & Kline, in the Blackwell district, are yet unable to sink on their rich quartz pocket, but are doing well sluicing the ground adjacent to it. Capt. Ankeny has returned from Calice creek and says both the English and Blue Gravel companies are enjoying full ditches of water, with a prospect of a long washing season. The Sterling Co. are just about ready to begin washing in their rich ground, and are now running their two pipes and a full supply of water. The heavy snow banks at the source of supply, will enable this company to work all summer. Brad. Dean, of Willow springs, was in town on Saturday with a nice lot of gold dust. He reports the most of the miners as having resumed ground sluicing, the water supply being flushed by the late heavy rain. Supt. Benner of the Centennial, was still piping night and day in good ground. Ralls has a full head of water on the richest ground in the camp, and is said to be making an ounce per day to the hand. From David L. Hopkins, who has just returned from Josephine county, we learn that the miners of that section have plenty of water and a good prospect for the supply continuing for some time. Wimer & Co. are making the dirt fly at their mines with excellent prospects. The Brown Bros. have changed the location of their hydraulic, and are now piping in a streak of gravel that prospects well. Mr. Hopkins thinks the mines in that locality will make a better showing this year than for some time past.

UTAH.

TIWAUKEE.—Salt Lake *Tribune*, Mar. 31: The lower tunnel cuts the ledge at 100 ft. From this point 2 drifts have been run at right angles on the vein for 75 ft, each from the tunnel east and west, thus opening the vein in length 150 ft, the greater part of which is in ore of a very fine quality. In the west drift a winze has been sunk 65 ft, showing ore the entire distance. The vein is 25 ft in width, but not all ore. From the tunnel a raise has been run 55 ft. Two crosscuts have been run on the vein from this raise, one 50 ft east, the other 35 ft west, showing ore the whole distance. Another raise is being run from the east drift on the lower level to connect with the upper crosscut and the upper workings of the mine. The ore is carefully sorted, both in the mine and ore house, and is divided into 4 classes. The 1st class sells for $125, the 2d for $100, the 3d for $60 and the 4th, which is screenings, for $30 per ton. With the present working force, the Tiwaukee can easily produce 100 tons of first-class ore monthly.

MAXWELL.—This mine is near Argenta, Big Cottonwood canyon, and is looking extremely well, having exposed a rich vein fully 3 ft thick within the last few days. The ore is a carbonate, heavy in lead and rich in silver.

DIAL.—Judge Kinney has made a good strike in this mine. The vein has widened out, showing a promising body of fine carbonate ore.

Protection of Mining Stockholders.

Fellows' Assembly bill, entitled an act for the further protection of stockholders in mining companies, has finally passed the Senate by a vote of 31 to 4, and has gone to the Governor for signature. The provisions of the bill are as follows:

SECTION 1. It shall not be lawful for the Directors of any mining corporation to sell, lease, mortgage, or otherwise dispose of the whole or any part of the mining ground owned or held by such corporation, nor to purchase or obtain, in any way, any additional mining ground, unless such act be ratified by the holders of at least two-thirds of the capital stock of such corporation. Such ratification may he made either in writing, signed and acknowledged by such stockholders, or hy resolution, duly passed at a stockholders' meeting called for that purpose.

SEC. 2. All stock in each and every mining corporation in this State shall stand in the books of said company, in all cases, in the names of the real owners of such stock, or in the name of tbe trustees of such real owners; but in every case where such stock shall stand in the name of a trustee, the party for whom he holds such stock in trust shall be designated upon said books, and also in the body of tho certificate of such stock.

SEC. 3. It shall not be lawful for any [such] corporation, or the Secretary thereof, to close the books of said corporation more than [three] days prior to the day of any election. At such election the stock of said corporation shall be voted by the bona fide owners thereof, as shown by the books of said corporation, unless the certificates of stock dnly indorsed, be produced at such election, in which case said certificates shall be deemed the highest evidence of ownership [and the holder thereof shall be entitled to vote the same].

SEC. 4. All acts and parts of acts in conflict with this act are herehy repealed.

SEC. 5. This act shall take effect from and after its passage.

The Hoover Telephone.

We have our editorial and composing rooms connected with a Hoover Telephone, and its workings give good satisfaction. It is not an electric telephone, but a simple arrangement of metallic diaphragms and an intensifying drum, and is called a mechanical telephone, in distiuction from the more complicated electric apparatuses. We can readily believe that the Hoover design is much better than others of its class, for we have tried some others and found them unsatisfactory, while the Hoover is a great convenience. The telephone is wholly of metals, and is quite ornamental in its appearance. It transmits the voice so perfectly as to preserve its individuality and enable its posaessor to be recognized. By the use of a double metallic diaphragm, in proper relation to a dead air chamber and conceutrating tube, the full volume of the voice is coucentrated within and upon the diaphragm, and, with the speed of electrical action, it is transmitted and reproduced upon the receiving diaphragm, and by it given off again to the ear of the listener at a distance of several feet from the instrument. A conical metal tube, which is surrounded hy a dead air chamber, conducts the sound to the vibrating diaphragm, from which its deflection is prevented hy an upper and concave diaphragm which forms the base of the dead air chamber. This gives much louder and clearer vibrations than are given by mouth-pieces made of wood or other solid substances.

For connecting office with factory, factory with salesroom, office with private residence, doctor's office with drng store, one store with another, upper floor with lower floor, a friend's house with another, and many hundred different uses, wbere the distance does not exceed one mile, we believe the Hoover telenhone will give good satisfaction. It is cheap, heing sent by express C. O. D. for $10 per pair, complete, with directions for setting up. The wire will be furnished for 5 cents per rod, if desired. The instruments are sold iu this city by the Hoover Telephone Company, room 24, 328 Montgomery street, to whom all communications may be addressed.

AT Matteson, Ill., a physician has been inoculating people with virus from a small-pox patient, in order to increase his practice.

THE Governor has offered a reward of $500 for the arrest of the murderers of C. P. Severance, killed in Marin conuty, last week.

IN a recent battle between the Chileans and Peruvians, the former lost all but 67 men out of a regiment of 1,200.

A HEAVY column of black smoke is issuing from one of the points of Mount Baker, in Washington Territory.

IN New York Government bonds are quoted at 107½ for 4s of 1907; 103½ for 5s of 1881; 109 for 4½s; sterling, $4.86@$4.89; silver bars, 113⅞; silver coin, ¼ discount huying, par selling.

The Californian.

The May number of this new magazine has just been issued. Two new departments have been added, and the index shows the contents to he varied and interesting. The magazine is aiming at a high standard, and endeavors each month to improve on the preceding numbers. We doubt not that the people of California will give that material support which is necessary to the maintenance of this monthly. It is projected on a high plane, and has met with warm encouragement. The contents of the May number are as follows:

Field Sports in Australia.....R. E. Desmond.
The First Legislature on this Continent..W. W. Crane, Jr.
In Shasta.....Charles H. Shinn.
Sand, Chapter V.....J. W. Cally.
The Present Crisis in San Francisco.....C. T. Hopkins.
The Philippine Islands.....Arthur T. Marvin
High Jinks.....Andrew McF. Davis.
Reminiscences of Col. E. D. Baker....Edward B. Jerome.
For the Last Time.....May N. Hawley.
Almost a Novel.....Philip Shirley.
A Day at an Old Mission.....Mary H. Field.
Ruby, Chapters III and IV.....Julia H. S. Bugeia.
The North Wind.....E. R. Sill.
The First Xerxes Loan Collection.....Octave Thanet.
Fish in Season.....W. N. Lockington.
Indian Dances in Northern California.....Lucy Sargent.

Note Book—"A Suggestive Picture," "The Aristocratic Impulse," "Intellectual Superiority as a Restraint," "California Prejudice and the Chinese Question," "Election-Mad," "Mr. Hopkins' Article, and a Word Concerning Contributions."

Science and Industry—"Transmitting Colors by Telegraph," "Harnessing Electricity," "Melting Steel by Friction," "Strength of Mind and Body," "Deadening Noises in Workshops," "Making Crape-sugar in the Kitchen," "Instability of High Factory Buildings," "A New Metallic Compound," "Insanity the Measure of Civilization," "Diogenes's Tub," "Revival after Freezing," "High-Power Microscopes."

Outcroppings—"An Incident," "The Woods of Chapultepec," "Rain-drops," "A Reminiscence of Von Weber," "A Young Widow's Reverie," "How I Lost Rosanna," "Discovery of the Bay of San Francisco," "Discontent," "Glimpses of a Story," "Twilight," "The Judge's Story," "At the Last," "The Novel," "My Cigarette." "Broken Cistern," "Booke Received," "Poem by Joaquin Miller Next Month," "Announcement."

CHANGING LIGHT-HOUSE OIL.—The steamer *Manzanita* which is the tender of the light-houses of the San Francisco district, has just returned to this port from her last trip to the light-houses of the district, and reports the substitution in the Humboldt, Trinidad, Crescent City, Yerba Buena, and the East Brothers' light-houses of kerosene oil for lard oil. This substitution is made by requirement of the Light-house Board of the United States.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING APRIL 0, 1880.

226,321.—CULTIVATOR—D. M. Johnston, Red Bluff, Cal
226,333.—STOCK CAR—W. Martin, S. F.
226,241.—HARNESS—P. S. Miller, S. F.
220,333.—WATER-CLOSET—G. Milne & W. H. Cants, S. F.
226,245 —BEER FAUCET—C. C. Redmond and A. W. White, San Jose, Cal.
220,357.—WINDMILL—G. Saccone, Sacramento, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

AT Cassiar, British Columbia, during the recent cold spell, quicksilver balls were fired with muskets through inch boards. Both there and at Glenora the thermometer was standing at 48° below zero. Nitric acid and whisky froze solid. Case brandy froze solid enough in 20 minutes to roll up in lumps like marbles. During the intense cold breathing was very oppressive.

WORK on the turquoise mine of New Mexico is being pushed. Tunnels are being run from each side of this mountain which will intersect and completely cut the mountain. Many fine specimens of turquoise have been found of good color and size. Ancient pottery is still found in large quantities, and quite a number of fragments of human skulls have been unearthed.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

CANDELARIA CON. M. CO.—Mar. 20th. Location: Esmeralda county, Nevada. Capital, $10,000,000. Directors—Simon Reinhart, H. M. Levy, R. P. Keating, T. M. Luce and P. J. White.

COLUMBUS CON. M. CO.—Mar. 20th. Location: Esmeralda county, Nevada. Capital, $10,000,000. Directors—Simon Reinhart, H. M. Levy, R. P. Keating, T. M. Luce and P. J. White.

GREEN MOUNTAIN M. & M. CO.—Mar. 29th. Capital, $10,000,000. Directors—J. D. Power, W. H. H. Hart, Clinton Curtnese, J. L. Browne and George S. Currier.

RED JACKET G. & S. M. CO.—Mar. 20th. Capital, $1,000,000. Directors—L. M. Tosh, P. G. Wibbard, C. H. Wakelee, G. W. Spencer and S. C. Curtis.

VALLECITO HYDRAULIC M. CO.—April 5th. Location: Calaveras county, Cal. Capital, $1,000,000. Directors—A. J. Bryant, E. B. Pond, Wm. Dunphy, C. H. Livingston and A. M. Mitchell.

MARIPOSA G. & S. M. CO.—Mar. 30th. Location: Mariposa county, Cal. Capital, $2,500,000. Directors—H. H. White, J. F. Brown, W. E. Brown, J. W. Snyder and E. S. Utter.

Quinine and Arsenic

Form the basis of many of the Ague Remedies in the market, and are the last resort of physicians and people who know no better medicine to employ for this distressing complaint. The effects of either of these drugs are destructive to the system, producing headache, intestinal disorders, vertigo, dizziness, ringing in the ears, and depression of the constitutional health. AYER'S AGUE CURE is a vegetable discovery, containing neither quinine, arsenic, nor any deleterious ingredient, and is an infallible and rapid cure for every form of Fever and Ague. Its effects are permanent and certain, and no injury can result from its use. Besides being a positive cure for Fever and Ague in all its forms, it is also a superior remedy for Liver Complaints. It is an excellent tonic and preventive, as well as cure, of all complaints peculiar to malarious, marshy and miasmatic districts. By direct action on the liver and biliary apparatus, it stimulates the system to a vigorous, healthy condition.

FOR SALE BY ALL DEALERS.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EVERY new subscriber who does not receive the paper, and every old subscriber not credited on the label, within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect ourselves and subscribers against the acts and mistakes of others.

SETTLERS and others wishing good farming lands for sure crops, are referred to Mr. Edward Frisbie, of Anderson, Shasta County, Cal., who has some 15,000 acres for sale in the Upper Sacramento valley. His advertisement appear from time to time in this paper.

THE BEST NEWSPAPER FILEHOLDER AND ADJUSTABLE BINDER can now be had at this office. It consists of elastic fastenings, with stiff, cloth covered side. Size suitable for a full volume of this paper, $1. To our subscribers, 75 cts., mailed postpaid.

THE SCIENCE RECORD for six months and our cloth covered newspaper fileholder and binder, for one dollar.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Chew JACKSON'S BEST Sweet Navy Tobacco.

Mining and Other Companies.

Pereons intereeted in incorporated eharee will do well to recommend the publication of the official noticee of their companies in thie paper, as the cheapeet appropriate medium for the eame.

Atlanta Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, 420 Montgomery St., San Francisco, Cal.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, April 29th, 1880, and day of sale to Monday, May 24th, 1880. By order of the Board of Directors. A. F. McGREW, Sec'y.

Office—Room 7, No. 420 Montgomery Street, San Francisco, California.

Gover Mining and Milling Company.—

Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 41), levied on the Eighth day of March, 1880, the several amounts set opposite the names of the respective shareholders, as follows:

Notice! Important to Miners!

An important Machine called the

DRY GOLD SEPARATOR

Has been invented and can be seen at No. 5 Beale St., S. F. Arrangements have been made to manufacture in quantities to suit the demand. Machines weigh from 200 to 300 lbs. Price, $30 to $150. They run 10 to 20 tons of gold-bearing earth through per day, thoroughly separating the precious metals from the earth. Several are at work in Arizona and Mexico. A guarantee with each machine. Call and see sample at No. 5 Beale street, near Market, San Francisco

Kendall's Spavin Cure

Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the bunch without blistering.

Office U. S. Marshal, Western Dist. of Michigan, }
Kalamazoo, April 15th, 1879. }

B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse restored to usefulness. Very truly yours, JOHN PARKER.

Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.

Howell's Improved White Roasting Cylinders. REVOLVING CYLINDERS AND ORE DRYERS. Hoisting and Pumping Machinery.

Rotary Pulverizer,

(WHITE'S IMPROVED,)

For Disintegrating Ores and Other Substances.

GUARANTEED TO BE EQUAL IN CAPACITY TO A

HUNDRED STAMP BATTERY!

IS FITTED UP WITH

Homogeneous Steel Beater Bars.

Found to be more durable than either Hard Steel or Soft Iron. Dry-crushing the hardest rock; will last for months, and without the slightest danger of breakage.

The Pulverizer requires about one-third the power usually expended for the reduction of the same amount of Ore by Stamps.

Price List, Etc., of the White Rotary Pulverizer.

No.	Tons Per Hour.	Inches Diameter.	Revolutions Per Minute.	Horse Power Required.	Shipping Weight.	Lumber Required.	Price.
1	6	56	600	40	12	6,000 ft.	$5,000
2	10	72	470	60	15	9,000 "	8,000
3	16	84	400	75	20	12,000 "	10,000

The Repairs on the Pulverizer will not exceed those of a 10-Stamp Battery.

The Shipping Weight of the entire apparatus is not one-eighth of that of Stamp-Mortars required to do an equal amount of work. ☞It can be placed and put running at the Mill in from fifteen to twenty days.

Address GEO. W. WHITE, Inventor.

Manufactured exclusively at the ÆTNA IRON WORKS, 217 Fremont St.

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

In consequence of spurious imitations of

LEA AND PERRINS' SAUCE,

which are calculated to deceive the Public, Lea and Perrins have adopted A NEW LABEL, bearing their Signature thus,

Lea & Perrins

which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

Ask for LEA & PERRINS' Sauce, and see Name on Wrapper, Label, Bottle and Stopper. Wholesale and for Export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen throughout the World.

To be obtained of CROSS & CO., San Francisco.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid

SUPERIOR TO THE CORLISS!

Our New Automatic Engine.

First—The Corliss Engine cannot, as a rule, take steam beyond two-fifths the stroke—unless it takes it all the way.

We can take five-eighths or three-quarters, or even more, if needed, and at the same time work down to one-tenth or one-twelfth, and get a good engine port.

Second—The Corliss cannot, without sacrificing some of this two-fifths and reducing its range of governing to a minimum, give any exhaust lead or cushion. The consequence of this is that Corliss Engines of almost every builder thump badly, and also need to be much larger than is absolutely required, so as to be ready for emergencies. It is plain that an engine that can give only two-fifths of a stroke cut-off is not to be relied on for sharp work under heavy change of load and must have a heavy fly-wheel to steady it.

We can give just what we need. Our New Automatic has trunk frame like the Corliss, but has rotary valves, both at bottom of the cylinder like the Wheelock. This is to save clearance. The valves are operated by cam motion, thus giving the most perfect opening and closing known. The valve opens full width and no further, and shuts just enough for safety. This saves wear and tear of reciprocating parts. Two eccentrics operate valve gear—one fixed, giving an invariable point of opening the steam and exhaust and closing the exhaust. The movable eccentric controlled by a rotary governor fixed on main shaft, where it can never get away, controls the closing, the valve being alternately controlled by the two eccentrics. No dash-pots nor noise, and the most exquisite adjustment.

We have two of these Engines already on the way, for parties on this coast.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, APRIL 24, 1880.

VOLUME XL Number 17.

Copper Leaching.—No. 1.

[Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.]

There are many different processes of copper extraction by leaching, some of which are impracticable in this country at present, while others appear well adapted for the profitable treatment of our extensive mines of low-grade ore.

A fair, though slightly incorrect outline of one of these methods, was given in the PRESS of April 3d, but the selection of the best, under different circumstances, should always be the subject of careful calculation by a competent metallurgist, aided, if possible, by experiments on a small, but still a working scale, in which all conditions on which results depend, must be noted, with a view to their maintenance in the larger operations to follow, the neglect of which precaution is the only cause of the distrust in which small tests are held by many, a feeling which seems justified by numerous disappointments, which, however, need not have occurred.

In some cases very low-grade ore, chiefly the refuse which accumulates in great quantities from the mining and assorting of better qualities, may be profitably treated, as has been done at Copperopolis by the very simple process of causing small streams of water to flow upon and percolate the pile, whereby a weak solution of copper is obtained from the spontaneously decomposing sulphurets, and is either led directly through a series of vats or launders containing scrap iron, or is previously raised by wind or water power, and again passed through the ore pile as often as may be necessary to obtain a stronger solution of copper. The ground under the pile should be rock or clay to prevent loss of the liquor.

The copper obtained in this way is very impure, and the consumption of iron is greater than where a more rapid process is used, amounting to as much as three or even four parts of iron to one part of copper. Both these are ascribable, in great measure, to long exposure of the liquor to the action of air, and may be partly obviated by conducting the precipitation in covered boxes, through which, and over the slow stream of liquor, the fumes of burning sulphur are made to pass, or, by boiling the sufficiently enriched liquor in a vat by means of a jet of steam, with some raw sulphurets coarsely pulverized, and then transferring the clear solution, still hot, to other vats containing the scrap iron.

The extraction of copper from the ore is facilitated by using over again, for percolation, the decoppered liquor from the precipitation. Salt is also useful.

Solutions of copper, especially when hot and strong, cause wood to shrink, while moisture makes it swell. The result of these opposing tendencies on wooden vessels, when used for such solutions, depends on the condition and kind of the wood, whence they should be so constructed and arranged as to admit of tightening the hoops, bolts, or clamps by which their parts are held together as often as may be necessary. If oblong wooden tanks are used, the pieces forming the ends should have the grain in the same direction as that of the bottom planks, so that both may shrink or swell together and in similar proportion.

This process is adapted only to ore of very low grade containing some sulphurets and not much lime, or to the residues from other processes, as will appear hereafter. Ores which do not decompose somewhat readily under the influence of air and moisture, should first be burned in heaps, which method will be spoken further of in my next. In some cases it will be best to crush and concentrate, by which a richer material is got for treatment by better processes, while in others concentration is not practicable.

Where iron for precipitation is too dear or hard to get, limestone or lime may be used in its place, giving, not metallic copper, but a product which will be more or less rich according to the "skill and ability" displayed in the use of the lime. The crude soda of the marshes in the State of Nevada can be so applied as to give a very good quality of carbonate of copper, and even where iron is used, its consumption may be lessened and the copper improved by a judicious use of these substances.

The object of these articles is not so much to enable the reader to work copper ores as to direct the attention of the mining public to likely fields of profitable enterprise, by means of a general outline of those processes which seem best adapted to our country at present. Those who desire to study the subject more closely are referred to such works as those of Kerl, Phillips, Lamborn and others.

ARIZONA.—We intend soon to commence a series of articles upon Arizona, giving a succinct account of its geographical features, mining interests, agricultural districts, etc., and a sketch of its history before and since its acquisition by the United States. Since the completion of the railroad to Yuma, population has increased rapidly, and since its completion to Tucson, the capital, some fifty or sixty persons have arrived daily at that place. The mineral riches of the Territory will compare favorably with those of California, Utah, Colorado or Nevada, and the country, arid though much of it may appear, is more fertile than either of the three last-named Territories. Eastern and European capital is flowing in rapidly, and it is to give Californians a more complete knowledge of the great importance of the region that we publish these articles.

COAL is known to underlie fully 30,000 square miles of the Territory of Montana.

Wheelock's Improved Variable Cut-off Engine.

This is one of the latest inventions in cut-off engines. Although only introduced within the past few years, it has already taken high rank among all the engines of its class. The grand prize was awarded it at the Paris exposition two years ago in competition with all the best engines of the world. There is no part of the country where a close working economical engine is of so much importance as on this coast. Cut-off engines have been objected to by engineers on account of the complication of the valve arrangement, and a want has long been felt among engineers for a more simple and accessible first-class engine. This desideratum has been attained in a remarkable degree in the engine herewith shown, by the reducing of the number of parts, and placing all the mechanism for operating the valves on the outside of the steam chest, by which result every defect may be at once detected.

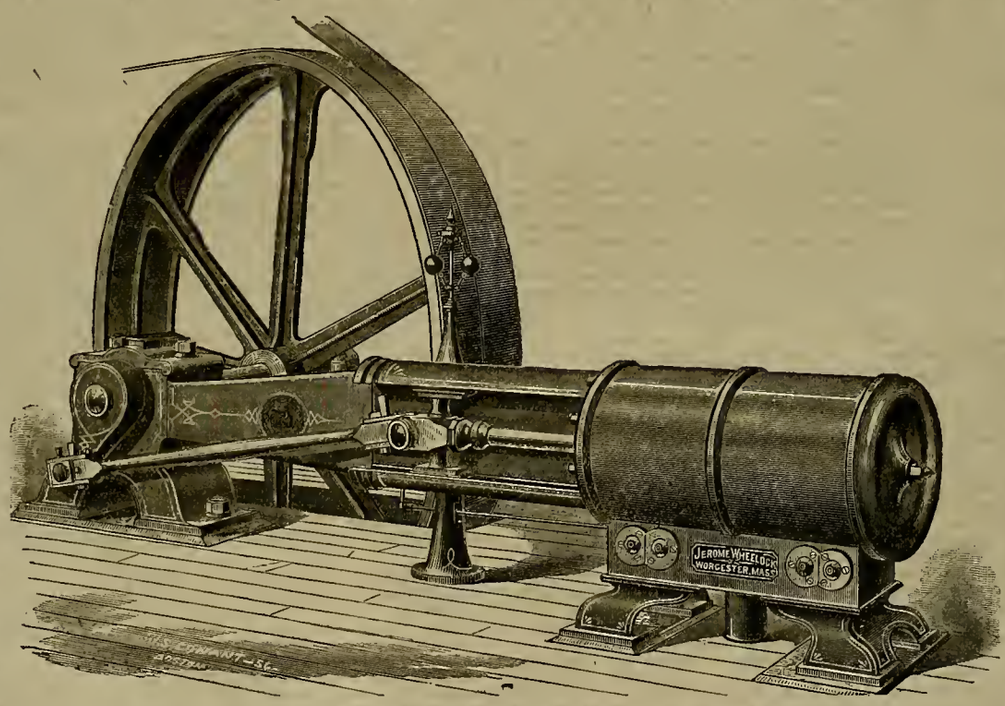

FIG. 1. THE WHEELOCK VARIABLE CUT-OFF ENGINE.

Valves are used which are suspended on hardened steel trunnions or stems and hardened steel bushings, and are located directly under the bore of the cylinder, at each end (reducing the clearance to the smallest possible amount.) The valves and seats are made tapering in their general diameter, and the pressure of steam comes on one side, also acting to keep the collar in contact with the sleeve. Steam is admitted and exhausted by a single valve, and any variation of the load is at once communicated through the action of the governor, which has control over two cut-off valves or wipers, by a simple mechanism, the construction of which is such as to insure uniformity of speed under extreme variations of load. By reference to sectional cut, on another page, it will be seen that a cavity in the cut-off valve allows of double admission and closing, which, when it is considered that the wiper is suspended on the hardened steel trunions and bushings, thereby maintaining the valve in a central position, that a most perfect result is obtained.

Attention is also called to the fact that the cut-off valve does not control the "lead" or time of admission to the cylinder, but is well open before the main valve is ready to open induction port. This is claimed as a great advantage, especially in cases where steam follows but a small portion of the stroke, inasmuch if cut-off opens but a "crack," as in cases where the lead is controlled by it, the mechanism is not sufficient to close it readily, and steam "sizzles" through the whole stroke, thereby making speed irregular.

The valve gear is constructed in the simplest form of the ordinary eccentric rod, and made to disengage at the pleasure of the engineer, by which result the engine can be worked by hand, either forward or backward, with perfect ease, a point very desirable in practice.

Motion is imparted to the valves by cranks keyed on to the hardened steel stems, which, being securely fastened to the valves, make any derangement inside impossible, while uniformity of wear is secured by the surfaces passing over each other at every revolution of the engine. By reference to the cut showing valve gearing, it will be noticed that the cut-off is worked from the main valve crank; the pin being an eccentric bolt, makes adjustment very handy; also that this attachment produces the celebrated wrist plate motion without its complications.

The entire adjustability of the valves to their seats is secured by a peculiar arrangement of the steel bushings (which can be driven in or out as required), the inner end forming a joint against a shoulder on the steel valve stem or trunion, obviating the necessity of any stuffing box. These steel stems have been found in practice to wear endways in about equal ratio with the surfaces of the valves and their seats, and, the valves being suspended, "with the surfaces but a contact" and pressure inclining the valves to their seats, great durability and ease of action is obtained.

The steam chest being located underneath, and forming a part of the cylinder, serves as a reservoir for water, thus guarding against all danger of injury to the cylinder, so common from that cause. Large bearings are introduced in every wearing surface, which, together with ample weight and extra quality of metal, secure in a high degree, economy in use. Rankin, Brayton & Co., of the Pacific Iron Works, in this city, have secured the exclusive right of manufacture for this coast, and are prepared to furnish these engines of all sizes from 20 to 500-horse power.

A QUEER MINING TUNNEL.—As a general thing miners' tunnels are pretty well run, as great care is usually exercised before operations are begun. In fact, very close work is done on this coast in mining surveying. Occasionally, however, bad mistakes are made. One in point is mentioned by the *Transcript* (Nevada county), where the parties sunk an incline and found a good ledge. They then went down into a ravine near by and started a tunnel to reach the incline. After running about 150 feet, they began to wonder that the ledge was not encountered, and had a survey made. The surveyor found that they had pushed the tunnel to within some 40 feet of the ledge, then in making a turn to avoid bad ground lost their bearings and started back nearly parallel with the first portion of the drift. Had they continued working in this manner a few days longer, they would have struck a ledge of daylight by emerging from the face of the bank less than a hundred feet below the point where they started, and thus had a tunnel with a double mouth. The boys feel badly sold, and say that hereafter if they want to dig a well even they will first get a surveyor to lay out the work for them.

Mining Outlook on the Comstock.

The Virginia *Enterprise* says: Of late people, both here and in San Francisco, have allowed themselves to tumble into the "Slough of Despond." It is much such a slough as that into which Bunyan's Christian fell, and of which he says: "Here, therefore, they wallowed for a time, and Christian, because of the burden that was on his back, began to sink into the mire." However, "Help" at length extricates Christian, sets him on his feet again and starts him off as good as new. It will be the same with the "Christians" who are now temporarily wallowing along "because of the burdens on their backs." They may not now see him, but "Help" is somewhere about and will presently lend them a hand.

Feelings of gloom and despondency are as much "catching" as are the feelings of elation and confidence experienced during the time of a great stock "boom." The sense of dejection spreads from man to man till whole communities are infected. It seems to be a thing that is in the air—in fact the whole atmosphere appears to be blue with it.

The tremendous yield of the "big bonanza" of the California and Con. Virginia is much to be blamed for the present grumbling and despondency. When a man's appetite has been for a year or two pampered and stimulated with highly-spiced viands he finds plain diet unpalatable and becomes a sort of chronic grumbler.

Previous to the discovery of the big bonanza the "grass" was really and truly very "short" on the Comstock. Very little bullion was being taken out anywhere, yet no such wide-spread feeling of despondency was observable as at present prevails, though our mines are now yielding over half a million dollars per month. Bullion is being shipped right along, yet people can hardly be made to pay the slightest attention to it, because the shipments are not such as they were wont to see in the days of the big bonanza.

Union Con. bullion, valued at $79,322.81, was shipped to San Francisco recently. This is the Union clean-up for March, and makes a total for the month of $360,806.80. The shipments of the north end mines for March are as follows:

Union Consolidated	$360,806.80
Ophir	18,612.40
California	28,411.80
Consolidated Virginia	151,386.01
Total	$559,217.01

During the three months of the present year bullion has been shipped as follows:

Sierra Nevada	$ 46,389.13
Union Consolidated	674,346.72
Ophir	138,026.19
California	231,379.52
Consolidated Virginia	473,776.86
Total	$1,553,918.42

Our people should "brace up." To be in "borasca" occasionally is the experience in all mining countries, but as truly as there is "borasca" just so truly and surely is there "bonanza." In everything there is good and bad—fat and lean.

In speaking of the present season of doleful dumps and the ups and downs of mining and life generally, we heard a man advise his friend to "hold up his head, even though the seat of his trowsers dragged the ground."

This was about as good advice as could well be given. Crying mends no broken pots. All things considered, mining is really no more discouraging than most other great branches of business. Let a man give it up and try ranching. It is all very fine while he is in "bonanza"—while the rains fall in their season and his crops fill his barns—but when he plows and sows for two or three years in succession and reaps nothing the case is different. He is in "borasca," but if he has the pluck to win in any business he does not give up, but plows and sows again.

A New Arizona Railroad.—A company has been organized at Tucson to build a railroad from the point where the Southern Pacific crosses the San Pedro river to Tombstone. The company is organized under and in accordance with the laws of the United States and Arizona, and is composed of the following officers: W. W. Williams, President; Hugh Farley, Secretary; and Messrs. Williams, Farley, Wm. Zeckendorf and Fitch, Farley & Pomeroy, Directors. The amount of capital is $1,200,000. A preliminary survey is already under way, under supervision of W. S. Edwards. After the completion of this a final survey will be made, and the work on the road is expected to commence as soon as circumstances and the well-known energy and means of the undertakers will permit. The road will be about forty miles in length, and will run from the San Pedro intersection via Contention and Charleston to Tombstone.—*Los Angeles Herald.*

Secretary Schurz has recommended to the House an appropriation of $500 to purchase the first patent ever issued in America. Accompanying it was a letter from E. T. Hall, of Columbus, O., the present possessor of the document, in which he says it was issued at New York, July 31, 1790, to Samuel Hopkins, of Philadelphia, for an improvement in making potash and pearlash. It is written on a sheet of parchment in a round, old-fashioned hand, signed by George Washington and certified by Edward Randolph, Attorney-General, as being conformable to the act of Congress to promote the useful arts, and its delivery to the grantee is certified by Thomas Jefferson, with the seal of the United States.

Coal Fields in Colorado.

In the southern part of La Plata county is an immense coal field, which extends from the valley of the Rio Les Pinos to the southeast end of Ute mountains. The field is in sandstones and shales of the cretaceous age, about 1,000 feet apart. The lower coal measure is in a zone of shady sandstones that are about 300 feet thick, and the coal is intermixed with shales and other impurities that render it worthless; but when separated from the shale, it is of excellent quality for domestic use. The lower measure is underlaid by a bed of dark gray shale, containing calcareous seams and nodules called septaria. The La Plata coal bed is located on a bed of whitish sandstone. It extends from the east end of the county for over 60 miles, and is crossed by the Animas river. The thickness of the entire bed between the floor and the roof is over 50 feet, and contains about 40 feet thick of good coal free from shale. The floor, of grayish white sandstone, is covered with a thin layer of clay and clay shale, varying from an inch or two to a thickness of two feet. Upon this a layer of compact, firm coal, 6 to 8 feet thick; then a layer of tough black shale, 1½ to 2 feet thick; upon this is a bed of excellent coal over 30 feet thick, with only small seams of shale at intervals of 4 to 10 feet. The "roof" is a tough, shaly sandstone, alternating with true shales for a distance of several hundred feet above the coal bed. In this overlying formation there are two or three small veins of coal, one of which is large enough for exploration.

The quality of coal has been tested in a crude way by coking it in pits and heaps, and by use in blacksmith shops, stoves and in open fireplaces, in all of which it gives good satisfaction. It is strongly bituminous, cinders well, and forms masses of coke in an open fire. It is exceedingly rich in gaseous products, takes fire readily and burns freely, leaving a brownish gray ash.

The working of these beds will be confined to the outcrop at the most convenient points where levels can be run for years. Its location will undoubtedly prevent it from being of any great commercial value; still it will prove to be a mine of inexhaustible wealth to La Plata and San Juan counties, in consequence of its coking qualities and adaptability to all kinds of metallurgical, mechanical and domestic uses. The material interests of San Juan and La Plata counties are inseparably interwoven by the drainage system of the San Juan river, the physical features of the country, and their mutual dependence on each other in many ways. San Juan has an abundance of the precious and useful metals, but can produce no food for her population. Her lowest mining camps are over 9,000 feet above the sea, and the highest peaks have an altitude of over 14,000 feet. La Plata raises vast quantities of meat, vegetables and grain, and supplies all demand for lumber, timber, coke and coal; but were it not for San Juan's needs, La Plata would have no market for anything, save cattle that could be driven to distant markets.—*La Plata Miner.*

Copper Mines.

Copper mines are now in demand in the New York market. This being the case it is probably worth while for people on this coast to give some attention to such mines. Copper is found in hundreds of places in California, and in this State we have some mines that promise well. There are many mines in the neighborhood of Peavine district that are rich in copper, though no work has been done on these except at or near the surface. Gold and silver are associated with most of the copper ores of that district, and the work done on the veins was more on account of a hope of finding those metals in paying quantities than with a view to doing anything with the copper.

In the vicinity of Pyramid lake in the early days some of native copper were found, specimens of which were brought to this city by prospectors, but since that time nothing has been heard of the vein or veins from which the samples were obtained.

In the vicinity of Walker lake are several large and rich deposits of copper. In that region some mining for copper has been done, the ore being used in the manufacture of blue stone (sulphate of copper) at Dayton. Parties who have given some attention to the matter say that there are several workable mines of copper in the direction of Walker lake, and that at one place is a large hill or mountain completely covered with copper ore of an excellent quality.

Once the branch railroad to Bodie is completed these mines are likely to prove valuable, as they cannot be far from where it will pass through. We must have in many places in this State ores that are richer than the majority of those now worked in the Lake Superior country.—*Territorial Enterprise.*

Silver ore has now been discovered at various points on or near the great Allegheny chain of mountains in Vermont, Pennsylvania, Maryland, Virginia and West Virginia, and these discoveries, taken in connection with the gold mines long known to exist in Virginia, North Carolina and Georgia, are sufficient to indicate that both the precious metals must abound in those mountain regions of the Atlantic States to a much greater extent than has been known or supposed.

Don't Exaggerate.

We might even put this in a more pointed monosyllabic form, but lest it should appear too rude, we tender this epigrammatic counsel "without prejudice" to all promoters of mining schemes, not only upon the ground that such a course is ethically improper, but upon the (to some) more convincing ground that it don't pay; that is, provided the promoter has a really valuable property to offer or any personal character to lose. It should be understood by all concerned in precious-metal mining that most of the tricks and dodges which sometimes, in the earlier stages of the industry, availed to place worthless claims, are fruitless now. This field has been so thoroughly exploited that the prospect of new and remunerative invention in the means and methods of swindling would be exceedingly slim, were it not that there is a new crop of fools every year.

A stake and a ten-foot shaft do not make a marketable mine. Nor do assays of specimen pieces from the location—or elsewhere. A statement published in some newspaper or book that a mine has yielded $50,000 when it has not yielded $500, is only so much time and energy thrown away. We have before us a volume containing many such misstatements, set forth with much art of presentation and letter-press—innocently and in good faith, so far as the author was concerned—who, in the lamentable absence of any authenticated data, could only take what was given to him by the unscrupulous mine-owner.

Nobody buys—or, at least, nobody should buy—a mine on such testimony. Vicinage (in fissure-veins) to a lode of established worth is no indication of value; and the immediate vicinity to a rich chimney is, as every practical miner and engineer knows, likely to be poor. A mining location must stand on its own merit. No one, unless he is personally familiar with the location and history of a mining property, should pay any considerable sum for it, except upon the careful examination and report of a disinterested expert; and with such, all the devices we have named go for nothing. The chances for the sale of any valuable mining claim are in all respects furthered by strict adherence to facts on the part of the owner or his agent, and are every way hindered by unfounded statements or exaggerations.

The editors of newspapers published at or near mining camps sometimes give currency to erroneous statements from no more directly mercenary motive than the desire to oblige their patrons or their neighbors, and to "help the country." Such editors should realize that unfounded stories of "finds" and "yields" do more than anything else to injure the prospects and defer the prosperity of a mining district. If credence is given them, they "develop" nothing but a formidable waste of money in unproductive ventures, which not only cripples to that extent means which might be otherwise advantageously used in profitable enterprises, but they insure "the country" a far more serious back-set in the impairment of that confidence which must not only be the precursor of capital, but the life of all solid business after it is obtained. Eastern men have paid large premiums in times past to dishonesty and ignorance; a net loss every way; for capital has been weakened without benefit to industry.

There is no reason why a gold or silver mine should not be operated with the same integrity of method and management as a railroad or a bank; and the time is near by when nothing less than this will be demanded of all such as in any way depend upon public opinion for a market.—*N. Y. Engineering and Mining Journal.*

A New Miner's Lamp.—A new miner's lamp has been invented, which, if it be adequately luminous, ought to be absolutely safe. The principle of the contrivance is the substitution of the light of phosphorescence for that of positive ignition, and the apparatus is described as being something like a tiny meat screen. The interior of the screen is covered with a brightly luminous paint, and it is even proposed to fit it up with a shelf or two, so that the pitman might carry in his lamp a "snack" of something to eat, whenever, during the intervals of work, he felt hungry. Of course it will be impossible to use this sort of lamp as a pipe-lighter, so that it is not at all likely, if it comes into general adoption, that its inventor will be very popular among the colliers. Still, if the apparatus can be made to work well it will be appreciated by pit-owners, to whom the destruction of property caused by an explosion is always a sore hardship. The great advantage such a lamp would have over that now in common use is that it guards against a peril from which the "Davy lamp" cannot protect the workmen. If that lamp be carried against a current of air mixed with fire-damp the explosive gas penetrates the gauze and comes into actual contact with the flame, and then naturally a catastrophe is the result. Obviously, no such risk is run by using a phosphorescent light in mines.—*London Daily Telegraph.*

The electric light at the Black Diamond Steel Works has been so successful that the lighting capacity of the apparatus is being increased from twelve to thirty-two lights, requiring two sixteen-light machines. This will be sufficient to illuminate the entire establishment, and will have the effect of rendering the interior of the works almost as light as day.—*Penn.*

The Comstock.

There can be no question that the depression in the Comstock is affecting injuriously the mining interests of the entire State in the eyes of Eastern investors. The idea prevails with them that the Comstock is "played out;" that it is not productive at great depth, and that it must soon be abandoned. Thinking thus, they class all other mining sections in Nevada in the same category, and away they go with their capital to the fresher fields of Colorado. It is this false idea that must be combatted at the East. Confidence must be restored in the wealth of the Comstock before we can expect a general mining boom in our State. A fair revival of prices, and a few dividend-paying mines on the Comstock just at this time would accomplish wonders for the rest of the State in the matter of attracting Eastern capital to a large number of languishing districts. The Comstock is not exhausted, and has not reached too great a depth to pay. Experience teaches that the bonanzas of the grand old lode have steadily improved in wealth with depth. The following figures from the Gold Hill *News*, discloses a state of facts which deserve to be attentively considered:

Between the surface and the 1000 level of the Comstock 12 bodies of ore have been worked out, yielding 3,520,309 tons of ore, of an average value of $29.65 per ton, and have produced $103,425,074 in bullion. The net profit of working these bodies has been $22,813,280, which sum has been returned to stockholders in dividends.

Between the 1000 and 2000 levels two ore bodies have been up to the present time uncovered, and one of these has been worked out. The first was in Belcher and Crown Point, and the second in Con. Virginia and California, and is not yet exhausted. Up to January 1, 1878, these two ore bodies yield 2,413,124 tons of ore, averaging $61.50 per ton, and producing $148,466,629 in bullion. The net profit in working these bodies up to the date above mentioned was $84,366,000, as per the return to the stockholders in dividends.

These figures show that while the quantity of ore extracted between the 1000 and 2000 levels was 1,107,185 tons less than the amount which the lode yielded between the surface and the 1000 level, the bullion product of the former was $45,041,555 in excess of the latter, and the net profit realized in dividends from the lower section was $61,522,720, or nearly 400% greater than in the upper.

Mining.—The year 1880 will long be remembered as that in which more extended legitimate mining operations will be successfully carried on than any in the previous history of mining. Arizona, New Mexico, Utah, Idaho, Montana, Colorado, Washington Territory, Oregon, California and Nevada will be thoroughly prospected. Tens of thousands of miners will be crevicing in our mountains and hills, when new and rich finds must, in all those mineral sections of country, be found. Thousands will fall by the wayside, victims to the toils and hardships of the prospectors' life, and other thousands by the hand of the savage scalp knife. Yet the work will proceed and the riches of our mountains brought to the light of day and the use of man; millions of capital in the East will be invested which is now lying idle, and the promise of rich yields from many new bullion producers will be the result. The Comstock, with its ponderous machinery and deep workings will be opened up at fabulous depths. The yield from the Bodies will continue to increase, and the 26 hoisting works now on prospecting mines, many of which possess merit of the best character, give almost positive assurance of being dividend paying properties before the snows of another winter fall, and is a good and substantial basis for confidence in mining securities, and the perfect safety of investment when properly and legitimately conducted.—*Bodie News.*

Sluice Mining in the Black Hills.—The indications for an active mining season, especially in placers, were never better than at present. Unusual preparations are going ahead in the gulches hereabouts. Bedrock flumes are talked of on every hand, and County Commissioner Allen already has a large force of men at work in Deadwood gulch just below Gayville. Another one will probably be put in on the Whitewood below Elizahethtown, while the ordinary placer boxes are being fixed up everywhere. Many of the claim owners who would not wash the gravel during the flush days of placer mining in the Hills are returning to first principles, and are themselves now willing to work for $5 or $6 a day on their own grounds. The Spring creek flume, if it gets through all right, will give the placer interests of the Hills a big boom. The Bear gulch miners are determined the present season to see what there is in the dirt of their country. On the whole, it is thought that more sluicing will be done this spring and the coming summer and fall than during any year since the opening of the Hills, and that the amount of dust taken out will be exceedingly encouraging.—*Black Hills Times.*

Use of Oleomargarine.—Suit pending in the United States Court concerning the oleomargarine patent, which has brought out the fact that oleomargarine, which is never quoted in the market, and which is not kept by any merchant as such, has a sale in the country of 98,000,000 pounds per annum.

MECHANICAL PROGRESS.

A Method of Constructing Factory Floors.

A curious method of laying floors is used in France when great solidity is needed, and which has obtained a wide application. It consists in putting down a floor, not, as usual, on sleepers, but in embedding the boarding in asphalt. Pieces of oak, usually about 2½ to 4 inches broad and 12 to 30 inches long and 1 inch thick, are pressed down into a layer of solid asphalt, not quite half an inch thick, in the well-known herring-bone pattern. To insure a complete adhesion of the wood to the asphalt and obtain the smallest possible joint, the edges of the pieces of wood are planed down, beveling toward the bottom, so that their cross-sections become wedge-like. It is stated that these floors are used mainly for ground stories, in barracks and in hospitals, and that they have been laid in the numerous newly-constructed forts around Metz. A number of advantages are cited in connection therewith. A plan in some respects resembling this has been employed in the construction of the floors in a new factory recently erected by Messrs. Bliss & Williams, Brooklyn. It is similar, however, only in some of the more unusual features, the details being altogether different. Sleepers are employed, but instead of stretching between supports they are solidly bedded in concrete. Upon them planking is placed, each plank as laid being bedded in hot tar.

One of the most annoying points of many otherwise well-built factories is their poorly constructed floors. A tight, smooth, strong and durable floor is what is wanted, but in floors as commonly constructed some of these qualities, at least, are lacking. A floor on which heavy machinery can be placed without regard to the position of beams and girders, is a rarity. Floors which have to rest upon the ground, as ordinarily built, are constantly wearing out and are never to be depended upon. The construction employed in the factory above mentioned combines all of the desirable qualities which we have mentioned, and avoids the objectionable features. The business conducted in this factory, which is the manufacture of presses and dies, is such as will test any floor quite severely. Accordingly, whatever construction is satisfactory in this case is very likely to prove desirable in other instances.

The following description shows the construction employed: The surface of the ground under the top earth had been removed was thoroughly smoothed and rolled. Four inches of concrete was then applied, and while this was wet locust stringers were bedded in it. These stringers were spaced about 30 inches between centers. After the concrete had become perfectly hard and solid, 2-inch planks of Georgia pine were laid, each plank in turn being bedded in hot tar, which was spread on to the concrete just fast as the planks were laid and spiked. The result is a floor upon which the heaviest machines can stand in any convenient position without the necessity of any special foundations. Moreover, it is water-proof, damp-proof, and no miasma can arise from the ground through it. The floor of this kind is both cheap and solid, but the advantage which will appeal to every factory owner and builder is that such a floor will last until worn out from the top. There can be no decay from the under side.

It is reported that floors constructed upon this general plan have been in use in some of the oldest factories upward of twenty-five years. They have not, however, come into general use.

LEATHER GEAR WHEELS.—A genius in Mezingen, Wurtemburg, has devised a process for making toothed wheels of leather instead of metal. The advantages claimed for them are that they have a much quieter and more elastic action, are extremely durable, and require no lubrication whatever. They are prepared from raw, untanned buffalo hides, thoroughly cleansed from all hair, flesh, etc., and glued together in many layers as are necessary to produce the breadth of wheel required. The cementing is effected under very heavy pressure, as in an hydraulic press, and this is kept up until the glue has completely hardened. From the slabs, or plates, thus prepared, the teeth are cut out by saw and chisel. Why not leather car wheels as well as paper car wheels?

AN IMPORTANT FACT.—At a recent meeting of the Manchester Geological Society, Mr. Peter Spence gave the following important information. He said that no boiler on his works had been chipped for the last 15 years. This was simply due to his keeping the water supplied to the boilers alkaline, by adding from time to time a little carbonate of soda or soda-ash. Mr. Kasman finds that zinc, introduced into steam boilers to prevent incrustation, effects the purpose where the waters are selenitic; but where the waters contain carbonates of lime, magnesia and iron, zinc first becomes brittle and porous, and then is rapidly reduced to powder.

FITTING A KEY TO A DRIVING WHEEL.—The key should not be fitted to bear hardest on the ends. It should have a close fit at the sides, but have no draft; all the draft should be on the end and bottom.

Form of Riveted Joints.

A recent exhaustive report on the above subject says: A riveted joint is in a certain sense an imperfect part of a structure. It cannot be so designed as to be throughout uniformly strained. It has always certain surfaces markedly weaker than the rest, at which consequently deterioration of the material or fracture by the action of the load is liable to occur. These surfaces of weakness are so related that in general the increase of one involves a diminution of the other. The joint, therefore, which will carry the greatest load before fracture will be that in which the stress reaches the breaking limit for each of these surfaces simultaneously. Since the rivet section can in general be increased only at the expense of the plate section, in the strongest joint the rivet and plate will reach their breaking point under the same load. It would seem, therefore, that the proportions of a riveted joint could be determined by the ordinary rules of applied mechanics without the need of experiment. That this is not so is probably mainly due to a second condition of imperfection in riveted joints. To apply the ordinary rules for the strength of materials to riveted joints, it is necessary that the distribution of the stresses on the surfaces of weakness should be known. If those stresses were as uniformly distributed as in an ordinary bar tested for tension or shearing, the problem would be simple. But in fact the stresses are less uniformly distributed, and the law of their distribution is unknown. Consequently the average stress on the surface of fracture of a riveted joint, when broken by a load, is less than it would be if the stress were uniformly distributed, and needs to be determined by special experiments. Further, it may be different for different forms of joint. This average stress, always less than the maximum stress which causes fracture, is here termed the apparent breaking stress. Hence the chief object of experiments on riveted joints is to determine the apparent breaking stresses, (1) for the different surfaces at which each joint may fracture, (2) for the different forms of joints.

In certain cases allowance may have to be made for progressive deterioration of a joint, by corrosion or otherwise, which reduces the strength in certain directions more than in others. No experiments showing the amount of deterioration in such cases appear to have been made.

On the Use of Screws.

At a recent meeting of the Polytechnic Association an interesting discussion on the proper mode of using screws took place. It was contended by some speakers that the hold on the wood obtained by an ordinary wood screw would be no less if driven nearly home with a hammer, and then given a few half turns, than if driven all the way with a screw driver. It was asserted, as the experience of a builder doing a large business in New York and Brooklyn, that they held just as well. The conclusion finally reached was that much depended on the character of the wood. One of the members present had made tests with a weighing instrument, and found that it took 28 pounds to draw a certain screw driven mainly by a hammer, and 52 pounds to draw its mate, driven all the way by a screw driver. In hard wood, as that used for furniture, a hole should be bored large to the depth of the plain part, and smaller the rest of the way, quite to the bottom. In soft wood no hole at all was better. The screw, by compressing the wood, got a firmer material to hold in. The president remarked that the general results or experience of an intelligent workman was valuable, even if not carefully measured, in any case, and not subject to the repetitions and comparisons which are requisite to dignify a test with the title of "experiment." But many, he thought, worked without getting experience in the sense of knowing the result at all, and cited numerous examples. Inquiry was made as to screw spikes specially intended to be driven by a hammer, having only one or two turns in their whole length. A gentleman present had used such in railroad ties to hold the rails. They were excellent, but were not approved for railroad spikes, because they held too tenaciously. It was absolutely necessary in railroad work to sometimes draw out spikes, and it was found too difficult to do it with the twisted ones.

CAST-IRON MAGNETS.—Cast-iron magnets are made by M. Carre, by melting soft metal very slightly carbureted in crucibles, adding from 10% to 15% of steel filings, and running it into molds. If 1% to 1½% of nickel be added to the mixture, and from 25 to 30·1000ths of copper, or 2% of tin and 50·1000ths of copper, the molded iron can be tempered at a cherry-red heat. The best result is stated to be obtained by tempering pure cast iron at as high a temperature as the molded pieces will stand without distortion or fracture.

TO DISCOVER FLAWS IN SHAFTS OR DEFECTS IN WELDS.—If a piece of iron appears to have an unsound weld, or if it has a crack apparent upon the surface and it is desired to know how deep it penetrates, heat the part to be tested to a red heat and pour a fine stream of water upon the faulty spot, but mainly on one side of it, and the iron on that side will lose its redness more rapidly than the other side, and plainly indicate how deeply the defect extends.

THE STEEL TRADE OF THE WORLD.—The total capacity of the steel mills at the present time throughout the world is about 3,000,000 tons per annum. In the United Kingdom there are 120 Bessemer converters built, of which over 80 are at work, and the annual yield from these is considered as from 755,000 to 800,000 tons. The American make is estimated at 750,000 tons, the next largest producer being Germany. Two years ago there were 25 converters in Prussia working out of the 50 built, and turning out 375,000 tons, which were increased by the works in Saxony and Palatinate to 400,000; and since the revival of trade fresh converters have been put in operation. The estimats of the French steel manufacture is about 275,000 tons; that of Belgium, 150,000; of Austria, with 32 converters, 250,000; and of Sweden and Russia, 150,000. To all this it is proper to add that the steel capacity of the United States is being largely increased.

TO DISTINGUISH DIFFERENT KINDS OF IRON. A correspondent of the *Blacksmith and Wheelwright* says: To test different kinds of iron a charcoal fire should be made or a hollow fire of coke or coal that is free from sulphur. In this, heat a piece of Burdon best, welded to a piece of cast steel. Swedish iron is easily detected by the sparks before a welding heat. Norway, Burdon or any other soft iron looks like a piece of fat pork when a good heat is up. Green coal, with dirt or sulphur in the fire, gives a darker color to the heat. A hollow fire is the best. Do not permit the coal to touch the iron when it is approaching a white heat. There is as much difference in Norway irons as there is in refined irons, and similar differences can be found in Low Moor, even in the same bar.

A PLASTERING MACHINE.—A machine for plastering walls has been invented, which consists of a receptacle for the mortar, the segment of a cylinder in form. It is provided with a hinged plate that presses against the mortar, and, as the receptacle is moved upward against the wall, presses the plaster out through a narrow-ganged opening at the bottom.

SCIENTIFIC PROGRESS.

A NEW WAY OF HEATING RAILWAY CARRIAGES.—It is reported from Lyons that the Compagnie Paris-Lyon-Mediterranee is now trying a new method of heating in express trains. The method was proposed by M. Ancelin, an engineer, and consists simply in the use of acetate of soda in the foot-warmers. The substance has considerable latent heat; dissolving at a certain temperature, it thus absorbs a large quantity of heat, which becomes sensible during crystallization in cooling. All that is required is to fill the ordinary cases with a sufficient quantity of the acetate, close them, and place them in a stove at about 100°. The cooling of a case thus charged and heated takes twelve to fifteen hours. The warmers are thereafter taken from the compartments and placed in a stove (where the crystals of soda acetate are redissolved); they are then ready for fresh use. The advantages of such a system are obvious—no necessity of changing warmers every two or three hours, or of maintaining a numerous body of men at stations to attend to them; economy in cost of heating, etc. Moreover, most of the existing foot-warms can be utilized. Acetate of soda is not very expensive, and it could easily be manufactured in much larger quantities than at present if the demand required it. The new system has been tried on the express train, No. 5, leaving Paris at 7:15, and reaching Perrache at 4:31. The compartments were each supplied at starting with two warmers containing acetate of soda. At Perrache most of the warmers were still so hot that one could not apply the back of the hand to them. From Lyons to Marseilles the train was heated on the ordinary system.

CRYSTALLINE GLUCOSE.—Peligot has been making some experiments with glucoses, the results of which he has communicated to the French Academy of Sciences. When glucose is subjected to the action of alkalies a crystalline substance is produced, to which the name of "saccharose" is given. This product has the same composition as cane sugar, but is readily distinguished from it. Saccharose when tasted leaves a perceptibly bitter taste in the mouth, and it does not ferment in the presence of yeast. He has found, also, that true saponification occurs when glucose is acted upon by lime.

A FORTHCOMING REPORT ON EDISON'S LIGHT. It is reported that, in view of much unfavorable criticism, Mr. Edison decided, some time ago, to submit his whole plan for *electric lighting* to the critical examination of experts. It is intimated that Profs. Barker and Rowland have been at work upon a report of this kind, which will shortly be made public. As Prof. Barker is known to be one of Mr. Edison's stanchest supporters, the tenor of this report will not be difficult to predict.

A MENSTRUUM FOR CARBON.—London *Nature* is authority for the statement that Dr. Sidney Marsden, an experimenter in the field of crystallizing carbon, has discovered a menstruum in which carbon is soluble, and from which it crystallizes partly as graphite and partly as diamond. The crystals of the latter are octohedral in form and readily scratch sapphire.

Interglacial Quartz Workers in Minnesota.

In 1876, Prof. Winchell found in and around Little Falls, Minnesota, a number of fragments of wrought quartz in surface deposits underneath the remains of the mound builders. Prof. Winchell, accordingly, fixed the era of the quartz workers between that of the mound builders and the close of the glacial epoch.

At a late meeting of the Historical Society, at Minneapolis, Minnesota, Francis E. Babbit gave an account of a considerable deposit of quartz chips and implements found in regular strata, which must have been formed before the close of the glacial period. The specimens consist of hammers, implements, etc., both finished and unfinished, together with the chips struck off from the articles in the process of manufacture. The material of which they are composed is principally compact, lustrous quartz, frequently mottled as if selected with an eye to the artistic beauty. The stratum is some few inches in thickness, and lies in the soil a few feet below the surface. The appearances indicate that this was once the site of a manufactory of such quartz objects, and this idea is upheld by various considerations. There are tools found such as would be used in the manufacture of quartz articles, and the whole stratum is mixed with chips, which in many cases appear stuck in the dirt just as they fell from the hand of the unknown. Unfinished implements are also found in more or less advanced stages of manufacture. It is not possible to fix the precise point occupied by these remains in the scale of the glacial epoch until the drift features and surrounding formations of the locality shall be better understood than now. Still it is certain that the remains belong to a people living before the end of the last glacial period, because they are deposited in a drift which is known to be of glacial origin. The hard pan upon which the quartz formations lie is probably of the first glacial period, and the quartz may belong to an interglacial epoch.

LIGHT AND HEAVY BLOWS.—The difference in effect between a blow delivered by a light hammer traveling fast, and one delivered by a heavier hammer traveling more slowly, is that the effects of the blow are more confined in the first case, and more spread in the second. The blow from a light hammer penetrates but slightly below the surface; while a blow from a heavy hammer penetrates deeply into the metal which is being forged. In practice it will be observed that light quick blows, have a tendency to drive out of shape, split and break the iron; while the force of heavy blows, with a heavy hammer, going slow, penetrates deeply into the iron and forces the mass of the metal out into the desired shape. Every wood-chopper knows the difference in effect between the effort to drive a wedge into a tight place by light blows or by heavy ones.

SNOW-COVERED GROUND.—A paper by M. Bequerel was read recently before the French Academy of Sciences on the temperature of snow-covered ground. The author maintained that snow of itself does not protect from frost the bodies covered with it. It acts, indeed, as a screen preventing radiation, and gives water, at a temperature just above the freezing point, which filters through the ground, but below that temperature it undergoes, like other bodies, variations of temperature which may be transmitted. If, however, straw or similar substances had been laid on the ground before the snow fell, there would be a greater probability that organic bodies in the earth would remain uninjured by subsequent frosts.

PUNCHING IRON.—An interesting experiment was reported at the last meeting of the Engineers' Club, of Philadelphia, by Mr. Percival Roberts, to show the small quantity of iron that is removed in the process of cold punching that metal. A section of a partly punched nut was exhibited, etched by acid, to show the *solid metallic flow* of the metal induced by the cold punching process. The section demonstrated that only 40% of the volume of iron leaves the hole, thus proving that a cold-punched nut must be much stronger than one that is hot punched.

ARTIFICIAL OLIGISTE.—An interesting account of the artificial production of oligiste is given in the *Italian Chemical Gazette:* Pieces of lava from Vesuvius were placed in a concentrated solution of common salt and then introduced into a bottomless crucible, where they were subjected to the heat of a Bunsen burner for several days. At the end of that time the fragments were seen to be covered with hematite, and scales of oligiste were scantily dispersed over the surface.

TOUGHENED glass has been found by M. Dncretet to oppose a much greater resistance to the passage of electricity than common glass, and he has employed it in constructing Leyden jars which are capable of receiving a much heavier charge than those of ordinary glass. Becquerel has suggested that this product may probably be used in the construction of extremely thin condensers capable of giving great effects.

HABITS OF FISHES.—It has been long known that fishes return to about the same place in the same rivers each year to spawn, but it is a recent discovery that they go up the left hand side of the stream and coming down take the opposite side. Fishermen may be benefited by remembering this.

The Mining Bureau.

EDITORS PRESS:—There having been, first and last, more or less misapprehension concerning Assembly Bill 415, entitled "An Act to Establish and Maintain a Mining Bureau," it may be in place, now that the bill has received the approval of Gov. Perkins, for the undersigned to briefly outline what he intended should be the precise objects of that measure. The language of the bill, though much more lacking of comprehension than the New Constitution, is not all it ought to have been. Last week, when I saw that it was likely to become a part of the statutes, I left, in substance, the following memoranda with the Governor, with the request that he "take the bits in his teeth," so to speak, and carry out, during his administration, the practical intents of the law. First, select a person for State Mineralogist who had experience, common sense and scientific training equal to the practical wants of the people at large, and not the highly educated few. It has become a set phrase with too many, that is, "the mining countics," as if almost every county in California were not rich in mineral substances of great value. Where it is not gold, silver or quicksilver, it is coal, iron, tin, marble, borax, salt, soda, paint-stuffs, building-stones and the hundred and one substances that possess a commercial value and enter largely into the arts and manufactures. Yet where are there convenient records of their location and extent? Now, secondly, it is the object of the Bureau to obtain just such information through reports, maps and samples of the minerals themselves. There should be a geological or mineralogical map of every county in the State, showing all these things as plain as a guide-board. In the next place, a carefnl compilation of all that is good of the past history of mining in this great state into one handy volume, embodying all that is of practical use under the head of geology, followed by fresh and regular reports. The easiest part of the work will be to collect and classify the necessary rocks and ores for public exhibition and comparison. If this last were the total aim of the bureau, the name of museum would have constituted a better title, and the whole thing were a mistake. The plain title of the bill seemed to me to imply just what the people required—mining bureau; mining is a word every one has some practical conception of, while the word bureau is the most familiar of household words. "Handy as a pocket in a shirt," for old as well as young. Museum is a good enough word, but is too suggestive of stuffed owls, hermetically sealed glass cases with old fossils. What we want in a convenient or central portion of the metropolis, is a bureau of maps, reports, rocks and ores that every day people, prospectors and miners cannot only look at, but touch, taste and handle again and again. I hope you get my idea of it all, and will "stand by" and help the Governor and the Mineralogist whoever he may be) carry it ont. Of course, unless "stocks are up," the means will be scarcely snfficient to give the work a fair send off; but at worst, it is boped that there will be enough to soon create the nucleus of an institution, the State and city in a few years will be proud of. JOS. WASSON.

Mining Share Market.

The long-continued and unprecedented storm, which during the week has raged with so much severity, has blockaded all railroads and leveled the telegraphs so completely that the business of the market has been entirely local. Owing to the fact that no information could be obtained from the mines, there has been no ground on which to base operations; and as no outside orders could reach the brokers, there has been more positive dullness than was ever known before. The mines may have petered ont, or they may have opened into bonanzas of marvelous wealth, and while the facts were not known there, selling short or anticipating a rise might be ruinous to the speculator who should take the risk. It is the part of wisdom to stand still when an almost Egyptian darkness pervades the stock atmosphere; to advance or recede under such conditions would be extra-hazardous, if we may borrow a fire-insurance phrase. The wind, at this writing, has not changed, and the frequent showers here may be permanent rains in the interior, and be adding to the already fearful accounts of floods, snows and snowslides which reached us before the suspension of intercommunication. It would be gratifying to have this embargo upon information dispelled speedily, for the public have been so accustomed to learning the daily news of the world, that, now it is withheld, a news famine is nearly as disagreeable as a scant supply of food.

THE HOOVER TELEPHONE.—The telephone of this pattern which connects our editorial and compositing rooms continues to operate very satisfactorily. The distance is short, but it would evidently succeed at a much greater distance. Whether it would succeed with a mile of wire we do not know from experience. The statement made to that effect in last week's PRESS was given on the authority of the agents and we have data neither to doubt nor prove it.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

NEW VEIN.—Amador *Dispatch*, April 17: A rich vein of quartz, 2 or 3 ft wide, was struck at the Monterichard mine, a few days since, near the surface of the ground, and but a short distance from the original shaft.

THE Zelle mill has adopted the use of one of Knight's patent water wheels, and is now being run by water power instead of by steam.

AQUEDUCT CITY MINES.—The placer miners of this part of the county have not been doing much this past winter owing to the extreme cold weather, and a consequent lack of water. The Grass Valley mining company, superintended by Mr. L. McLaine, is doing a rushing business with two big hydraulic pipes, which are kept running day and night; and judging from the gold that one sees in walking over the bedrock of the claim, the company will make a fine clean-up some day. Mr. Wheeler, of Pine Grove, is also piping successfully, as is believed, on one of the best mines in Amador county, or any where else. Mr. Randell, of Pine Grove, is also operating on his old hydraulic claim, which prospects well. In fact there are more paying mines in this vicinity than can be supplied with water at present.

YELLOW JACKET.—Amador *Ledger*, April 17: Very gratifying reports reach us concerning this Drytown mine. The shaft is down 72 ft, with an ore body 5 ft in width, 7 ft of ledge matter between the walls. No drifts have been commenced as yet, and it is the intention to sink to the depth of 170 ft before drifting. A large quantity of rock, estimated at 140 tons, lies on the dump, which good judges say will average $15 or $16 per ton. Parcels of the rock, representing the average grade, have been worked by ordinary mill process, and surrendered at the rate of $16 per ton.

ORIGINAL AMADOR.—This prominent mine of Amador City has been brought almost to a standstill. The mill is idle, and the extraction of ore suspended. The owners have decided to confine operations to prospecting. Eight miners only are employed; 4 running a crosscut and 4 in the winze. The trouble with the mine has been the narrow ledge, and extremely hard rock, making it very expensive to work.

ZEILE.—The mill was started by water power for a short time on Saturday, but it was not until Tuesday the water-power machinery got fairly under way. It was then found, as Mr. Knight, the machinist, anticipated, that the power was equal to running the full 40 stamps of the mill, but that it was hardly capable of operating the rock crusher as well. To obviate this difficulty, a larger nozzle is deemed necessary, and will be ready in a day or so. There is only 150 ft fall for the water running the mill, and consequently it requires a large body of water to give the necessary power. It will tax the full capacity of the Moore ditch to supply this mill and the claims on Murphy's ridge.

MISCELLANEOUS.—The Gover mine, it is reported, is looking well—better rock and more of it. The North Gover company have again started drifting into their ground, from the 700-ft level of the Gover. The Keystone company has resolved to thoroughly repair their mill this summer, but that rumor of adding additional stamps is without foundation.

BUTTE.

OROVILLE BLACK SAND MILLS.—Butte *Record*, April 17: Major Frank McLaughlin, agent for Edison, and G. E. Carman, chemist, passed through Omaha Friday for Oroville, Cal., to receive bids and to make contracts for the construction of ore mills at that place for the Edison mining company, the owners of the Edison electro-chemical process of extracting gold from tailings. This process will be used in this mill, which is to be completed in August.

FRESNO.

SAMPSON FLAT MINES.—Cor. Fresno *Expositor*, April 21: These mines were discovered in January, but the matter was kept a profound secret by the discoverers until quite recently. Their object was to have ample time to discover and locate the best ledges before the excitement. Their success has been good. The leading claims are Big Sampson, owned by Little, McBee & Co.—this ledge is 8 ft wide, and assays $90 to $100 gold per ton; the North Star, owned by Fenwick, Rape, Converse & Lewis, assays from $150 to $200 per ton, and is 3 ft in width; the Monitor, owned by Davis, Lewis, Shannon and Case, is 5 ft wide, and gives an average assay of $1,200 per ton. They all are in slate formation, and carry free gold. This camp has the finest prospects for the future of any camp I was ever in, and our county should take the first steps to build a road here, via White Deer valley, to secure the trade of this district.

INYO.

CERRO GORDO.—Inyo *Independent:* An unusual number of mining men and speculators, from San Francisco and the East, are at present at Cerro Gordo. The outlook is flattering for the grand old district, the great and solid merits of which should have been recognized by capital long ago. Certain influences have been steadily at work for a long time to bring about this new state of affairs, and will prove successful in spite of opposition. Those who imagine that Cerro Gordo has seen its best days, or that its immense wealth has ever been half developed, are badly deceived and know very little of the facts.

MONO.

BENTON MINES.—*Bentonian*, April 17: The Diana mine is steadily improving in richness as depth is attained. Down 600 ft with a whim. Can't go much further with that power. Ledge fully 6 ft wide, and carrying no water. Numerous locations are being made. Looks as if our miners had confidence and were preparing for business in the near future.

LAUREL DISTRICT.—Mammoth City *Herald:* Jack Casey, who was in town last Monday, brings most encouraging news from this district, and shows a quantity of ore taken from a shaft only 16 or 18 ft deep, in which free gold in goodly quantities is seen, and also chlorides of silver. It was taken from the I X L mine, owned by Casey & McLain. The ledge is about 12 ft wide.

NEVADA.

WASHINGTON MINE.—Grass Valley *Union*, April 17: The shaft of the Washington quartz claim, situated in the valley northeast of the Idaho mine, is down 217 ft. It is 4½ by 11 ft and has 3 compartments. There is at present next to the hanging wall a 12-inch ledge of good quartz and a 6-inch streak of sulphureted ore. It is contemplated to sink the shaft 100 ft deeper, unless the increasing size of the vein should justify drifting sooner.

STORM.—This storm will be the means of greatly interfering with mining, as the ditches will be again filled with snow, and in quartz operations it will prevent hauling to custom mills, as well as the hauling of wood to the hoisting works that are short of fuel. There is satisfaction in knowing that an April snow cannot last long, as a freeze will not follow.

NEVADA M. CO.—The mine belonging to this company, the location of which is on Rich hill, opposite the site of the old Magenta hoisting works, is giving encouraging prospects. A prospect shaft was at first sunk upon the croppings, and afterward a tunnel run a distance of 200 ft to strike the ledge. From the tunnel drifts have run on the ledge, in all, a distance of 400 ft. The ledge is now from 18 to 24 inches in width, and shows well in free gold and sulphurets. There are about 150 ft of backs above the tunnel level, enough to afford work for some time to come without erecting machinery or sinking deeper.

ITEMS.—Nevada City *Herald*, April 17: Work has been resumed at the Manzanita mine. The company is now running a full head of water. The Live Yankee mine is still idle, owing to the wet weather. Another rich strike is reported at the Bald Mountain claim, near Forest City. The Blue Tent company is employing a full force of men, and running from 1,200 to 1,500 inches of water. Work at the Merrimac is progressing slowly; no new developments have been made. A number of mines have been idle on account of the late storm.

TEMPORARILY SUSPENDED.—*Transcript*, April 16: Prospecting has been temporarily suspended on the Wind-up drift claim, which is situated near Sargent & Jacobs', Quaker hill. A bedrock tunnel 876 ft in length has been run to date, and many believe that the gravel channel being sought would have been found within a short distance ahead. Some of the stockholders in the Wind-up express considerable dissatisfaction at the determination of the directors to quit work even for a short time.

ROUND MOUNTAIN MINE.—Since their last clean-up the Round Mountain boys have been working with renewed vigor in their promising drift mine, and are being rewarded by finding some good gravel. They are now engaged in passing through the old workings, and expect soon to get into entirely new ground where a bonanza is likely to be encountered.

PLACER.

MICHIGAN BLUFF.—Placer *Herald*, April 17: The mines are working, but on account of the ditch being broken in so many places have not done much washing yet, but it will be repaired, and all will be O K in a few days. The El Dorado Hill company is pushing ahead rapidly. The quartz mine owned by C. J. McCoon will have a mill in course of erection in 8 or 10 days. He has some very rich specimens of quartz taken out a few days since over the surface; he has a very good showing of the filthy lucer.

FRANKLIN.—Dutch Flat *Forum*, April 16: The Franklin mining company is making preparations for opening the James Teaff shaft. They propose sinking and drifting out from the shaft to prospect the ground. The pipe is being laid and machinery erected for carrying on the work.

THE mines at Hunt's hill, Elmore hill, Forest hill, Quaker hill, and in fact all the hills, are reported running with full heads of water.

THE Hollis mine cleaned up last Sunday. E. Miner, the Superintendent, reports a very successful run; about $3,000 was taken out. The prospects of the mine are claimed to be most flattering.

A FEW days since, a miner, at Remington hill, in attempting to move a boulder, discovered a bonanza. The rock was about 2 ft in dismeter and in attempting to turn it over it appeared to resist his efforts, so he picked up a sledge to break it. In examining the boulder for a favorable place to strike it, some gold on the surface attracted his attention, and on further examination it was found to be literally filled with gold, and worth several thousand dollars.

PLUMAS.

COMMENCED PIPING.—Plumas *National*, April 17: The Plumas water company started up their pipes at Gopher hill on Thursday, but have not got fairly to work yet. The water now comes from the lower ditches, the main supply at the lakes on Spanish peak being still in the embraces of Jack Frost. The company has made many additions and improvements to their mining machinery, and will tear the big banks all to pieces this summer.

THE miners in and about Meadow Valley and Spanish Ranch country have started the water through the sluices and are hard at work on the gravel banks.

SHASTA.

LOWER SODA SPRINGS.—Cor. Reading *Independent:* The miners are laughing all over, as they are having an abundance of water for mining purposes. Moss Clark exhibited a nugget that he picked up in his claim, weighing $27.50 gold weight. Clark says there are plenty more just like it, and he will commence cleaning up as soon as the weather settles. J. P. Williams & Co. are running a large self-shooter in the Dan Lace gulch, and are getting good prospects. There are several other mines on the creek, and the most of the miners expect to do well.

MR. LOUIS BLANDINO, of San Francisco, in company with Mr. Nichols and others visited several of the promising ledges in the county last week; among others, the Murray mine. Mr. B. expressed himself well pleased with the appearance of these ledges and the country generally, and thinks that Shasta county shows abundant evidences of mineral wealth.

TUOLUMNE.

EASTON M. CO.—Tuolumne *Independent*, April 17: This claim, at Arastraville, has a shaft down 100 ft, with two stopes—one of 50 ft, and the other of 30 ft—to uncover and learn the extent of the vein, which now stands out clear and defined, about 1 ft in width, and going wider and better as they go down. The rock shows well in sulphurets, while the free gold may be seen thick in almost any piece of rock that can be examined, and which, by actual crushing, pays $85 to the ton. About 45 or 50 tons are lying on the dump ready for crushing, while nearly 100 ft of backe staud uncovered and ready to be taken out; but little is seen doing there now, however, owing to the recent heavy rains. The only machinery used at present is a horse whim.

LOUISIANA.—This mine, near Summersville, after a period of inaction, has again started into active operation. The mine, we understand, was offered to a San Francisco company a few months since for $25,000, but that it was not accepted at the time cannot be but a matter of congratulation to the present owner, Mr. Lombarde, recent developments having justified his raising it to a much larger sum—$35,000, if I am correctly informed, cash. A new 8-stamp mill is in course of construction, which will soon be completed. The power to be used will be hydraulic, after the plan of the turbine wheel. As yet only 14 men are employed, but when the mill is in running order and the south shaft reopened, it will necessitate the employment of a much larger force. The rock, coming from a vein ranging in width from 1 ft upwards, is anticipated will pay $60 per ton, of which 250 tons are already on the dump, with plenty more ready to be taken out.

NEVADA.

WASHOE DISTRICT.

OUR WASHOE SUMMARY.—Owing to some unexplainable cause, we have not received our usual weekly summary, and are, therefore, compelled to go to press without it.

BRISTOL DISTRICT.

HILLSIDE.—Pioche *Record*, April 10: The water jacket of the Hillside company is nearing completion, the flue arrester and sheet-iron stack are already in position, and with the exception of some additional masonry work to be done, the furnace will be in readiness to start up in the course of the next two weeks, with over 40,000 bushels of coal and a large amount of ore on dump. At the mill site of the Bristol S. M. company work is being rapidly pushed ahead. A large amount of lumber and machinery are already on the ground, three new buildings have been erected, and also the large derrick in connection with the artesian boring apparatus. More prospecting is now being done around Bristol than at any period heretofore known in the history of the district; everybody seems to have the fever and the air is full of strikes, and rumors of strikes.

CHERRY CREEK DISTRICT.

SCARCITY OF MINERS.—Eureka *Sentinel*, April 14: A correspondent writes us from Cherry Creek as follows: Just at present there is a great scarcity of miners in this district. The Star company is in need of a few good miners, several of their best men having left to take contracts on the Silver Wreath and Lookout mines, in Ruby Hill mining district. Messrs. Woodruff & Enner have put on a stage line this week between Cherry Creek and Schellburn.

EUREKA DISTRICT.

EUREKA CON. DIVIDEND.—Eureka *Sentinel*, April 17: The dividend declared on the 15th, by the directors of the Eureka Con., for the past month, is 20 cents per share larger than the last. This one is 50 cents, which would seem to indicate that the directors have faith in the future earnings of the mine. Eureka Con. is about the healthiest mining proposition on the list.

WORK TO BE COMMENCED.—We learn that work will shortly be commenced on the Seventy-Six and Stella mines, in New York canyon. They were sold during the winter to Eastern parties. A private letter states that a representative of the company will put in an appearance at an early day to inaugurate operations for the season.

ESMERALDA DISTRICT.

REAL DEL MONTE.—*Herald*, April 17: Work at this mine for the past week has been progressing finely. The tanks were put in operation and the shaft below the stationary tank at the 500 level was cleared. Drifting on the 300 and 500 levels has been progressing rapidly, the face of each drift showing promising indications. The Ingersoll drills will be put at work to-night. Sinking in the shaft will be commenced as soon as the necessary timbers arrive.

THANKSGIVING MINE.—In crosscutting the ledge at a depth of about 90 ft, several tons of ore was taken out, assaying all the way from $15 to $187 per ton. The ledge from the foot to the hanging wall carries ore that will pay to mill. Both walls are perfect. For our own satisfaction a tape line was stretched across the ledge, and instead of 54 ft it marked 57 ft. This may sound rather loud, but those who have any doubts can easily satisfy them by measuring for themselves, as the mine is open to everybody.

GOOD HOPE DISTRICT.

GOOD HOPE.—*Times-Review*, April 8: About a ton of ore taken from the You & I mine at Good Hope, is to be sent here to-day or to-morrow, to be tested. We understand from Mr. L. I. Hogle that it is the richest lot ever mined in that district. Several tons of the same quality have been extracted, and are lying on the dump, awaiting transportation to either Cornucopia or this place. All of the miners who have been at work in the district during the past winter have done well, and it is believed by them that Good Hope will come to the front again during the next few months, and this time with well developed mines to back it.

I X L DISTRICT.

GOOD OAK.—Eureka *Sentinel*, April 14: It appears that ore of extraordinary high grade has been struck by the Bayfield company. The Bayfield had just received the results of 3 assays made by Mr. R. S. Day, of Oreana. The highest was $1,700 in silver and $3,300 in gold, making a total of $5,000 per ton.

MINERAL HILL DISTRICT.

CHANGE OF MANAGEMENT.—Eureka *Sentinel*, April 8: A transfer of the mill and mining property at Mineral Hill will be effected shortly. In fact, the deeds were expected by last night's mail. When all is satisfactorily arranged, there will be a boom in that quarter of Eureka county. The new company propose to work in a methodical manner, and will tolerate no "coyoting" or "ropherring." Unless there should be some change from the present programme, 30 or 40 men will find employment in the mines of Mineral Hill within the next 6 weeks, and it will be lasting work, as those interested in developing that particular district have a large capital to prospect with.

RAILROAD DISTRICT.

NEW HOISTING WORKS.—Elko *Independent*, April 15: The Enterprise mining company, of Railroad district, has ordered hoisting works from San Francisco, which will arrive immediately. The company also ordered to-day by telegraph a lot of flat cable from the East.

TYBO DISTRICT.

PROMISING.—Eureka *Sentinel*, April 14: A very promising mine is being developed by Lute Luce and associates, near the Two G, at Tybo. Hitherto the company has enjoyed a monopoly of all the best mines of the district. It now looks as though a paying proposition was coming to the front in the hands of outsiders. We hope the new find may prove an important one. There cannot be any too many mines and companies in the camp for the welfare of the people. The more the better in every case.

ARIZONA.

MULE PASS DISTRICT.—Tucson *Record*, April 14: D. B. Rea, Esq., has just returned from a three weeks' trip to the Mule Pass district. A New York party, who have valuable property there, propose commencing extensive operations immediately; they find fine bodies of copper ore and contemplate erecting furnaces. Geo. W. Atkins has run a cut across the Atlanta mine and is now 10 ft in carbonate lead ore, and has not yet reached the hanging wall. There is plenty of wood and water on the ground. Corbin & Co. are engaged in developing valuable property in this district and are sanguine of success. Mr. Rea also informs us that O. W. McCullough has discovered, in Ramsey canyon, Huachuca mountains, high grade carbonates of black sulphurets, which promise to assay high in silver; formation on the surface indicates an immense vein.

TOMBSTONE DISTRICT.—Hoisting works on the Empire mine were erected last February. They have a 10x12 double cylinder, portable engine, 2 reels and power sufficient to sink from 1,200 to 1,500 ft. These are on their new working shaft, which is down 100 ft, on which they are working 8 8-hour shifts. Are sinking to intersect the drift run from the 180 level of the old shaft. When this is completed, they will commence taking out ore preparatory to erecting a mill. The hoisting works have been running 4 months. Hoisting works are now in process of erection on the Grand Central, and machinery is expected here daily. These works will be a duplicate of those on the Empire. They have a large, well-developed vein with pay ore almost equal to the Contention. The next mine that will have hoisting works is the Gerard or Tough Nut Extension. Their machinery is on the ground, but no lumber is yet received. These works are the same as the Contention, first class machinery, lighter than that on the Grand Central and Empire. The Head Center, Sulphuret, Sunset and True Blue will probably erect hoisting works within a month or two. The Grand Central has surveyed a mill site immediately adjoining the Contention mill, Contention City. The Sunset and True Blue are also looking for suitable locality for mills.

COLORADO.

BRECKINRIDGE DISTRICT.—Cor. Georgetown *Miner*, April 16: Lots vary in price according to location. Some on Main street are valued at $5,000, while on Lincoln avenue they vary from $25 to $600, on Ridge street, $100 secures a very eligible location. In Lincoln City three smelters are in active operation most of the time. They are under the supervision of Gording & Co. One mile beyond Lincoln City is a 15-stamp mill running constantly. The ore they are treating comes from the Helen and Elephant mines, situated in that vicinity. It is a fact not to be disputed that Summit county has within her borders as good, if not better, mines than any other county in Colorado. When the snow leaves the hills, prospecting will commence in earnest, and the results that are sure to follow will make Breckinridge second to no other camp in the State.

MIDDLE PARK.—Mr. G. Smart, one of the contractors on the Wolverine mine passed this way a few days ago apparently well pleased with the looks of the future prospects of the Campbell district. Ten

A Study of Certain California Seeds.*

How Their Forms Aid in Spreading the Plants.

[By Robert E. C. Stearns, University of California.]

The present aspect of the fields in the immediate neighborhood, south of the grounds of the University of California, at Berkeley, when compared with their general appearance five years ago, when the flora of the locality was first noticed by me, exhibits a marked contrast; and though during this time the varying character of the vegetation from year to year attracted my attention, the altered physiognomy of the fields particularly impressed me this past season, and curiosity has led me to seek for the causes which have produced what may be regarded as a most striking change.

The complexity of questions of this kind is increased, not only through the simpler factors involved, some of which are given below, but by the sequence of relationship of such factors to each other, which it is difficult to detect.

The climatology of the seasons during which such changes have been progressing; the tillage of proximate lands, and the introduction of new plants, or of plants new to a locality, through this agency or by other artificial means more or less direct, which follow the settlement of a region; other changes which follow through neglect of tillage, as where the cultivation of farming lands is abandoned, as is generally the case where such lands are divided and cut into small parcels for village or town plats or lots; these are a few of the more conspicuous agencies which produce changes of the kind mentioned herein, in the local flora of such neighborhoods. Again, the time required for the growth of a plant, from the sprouting of the seed to maturity, differs greatly in different plants, and the seeds of some plants germinate in much less time than the seeds of others. From this cause the aspect of the fields changes during the same season; those plants whose seeds start quickly and attain maturity in the shortest time, dominate for awhile, and give one aspect to the fields in the first part of the season, and those plants whose seeds sprout slowly only reach maturity after the earlier have passed their prime or died, then dominate†, and later in the season give to the fields a different complexion or appearance.

The occurrence of these changes and the domination of this or that plant inside of or within the number of plants which form the flora of a certain region, may be conspicuously modified, in one year or season as compared with another, by the character of the season as previously referred to. As some plants thrive best with only a moderate supply of moisture, and are dwarfed, decreased in number of individuals or suppressed by the "drowning" of the seeds ae the farmers call it, through excess of "wet"—so the latter might be highly favorable to the germination of the seeds and earlier development of the plants of some other species, which in normal or ordinary seasons would appear much later.

The effect of only one such season might extend through several seasons, and materially modify the landscape features in its annual plants for a period of many years.

Without further enlarging in this direction on certain points which have been referred to, as they cannot properly be passed unnoticed, attention is called to another class of factors, not generally recognized, but of sufficient importance not to admit of exclusion, wherein natural selection is illustrated as performing its part in a different way.

The domination of "the fittest," the character of a season considered, has been inferentially if not directly shown, where the effect of an unusually wet season is referred to; so certain plants which now dominate in my immediate neighborhood illustrate how natural selection has assisted, to say the least, in producing the change in the open fields near my residence in Berkeley, through the advantage which one form of seed has over seeds of a different form. And this, aside from its interest to the scientific observer, is of special interest to the farmer, for it enters into the economics of his business, as may be seen further on.

Only a few years ago the entire region hereabout, from the hills to the shore of the bay, was either farmed or used for pasturage. Where not tilled, over large portions of this area, the wild mustard *(Brassica nigra)* abounded, and was regarded by the farmers as a pest; it grew and thrived nearly everywhere, and often attained a hight sufficient "to hide all of a standing horse but his head." During later years the mustard has surrendered a part of the field to an (introduced?) turnip and radish, plants of the same order, with smooth seeds, and all three of these have been giving way, gradually yielding to other plants, native and introduced.

The mustard may, in some localities, regain in part its lost supremacy, through the assistance of man, as the seed within a few years has become of economic importance, and is also on the list of products in the export trade of the State.*

The principal plants within the more limited area first mentioned in this paper, to which these smooth-seeded *Cruciferæ* have been gradually yielding, have seeds of a different form. One of these is the *Alfillarilla*, or "filaree," by which name it is more generally known, a plant which is closely related to the geraniums, if we may judge from analogies of form in leaf and flower, structure of seed receptacle and shape of seeds. This alfillarilla, as it is called by the Spanish Californians, is an *Erodium*, and two species grow here, namely, *E. cicutarium* and *E. moschatum.*†

This genus is a form of "craneshill," and as will be seen by Fig. 1, and its gynœcium, Fig. 2, is somewhat like that of *Geranium maculatum*, as figured in Gray.

The latter figure, with the sepals removed, shows the ovaries with their slender bearded‡ styles or awns (Figs. 3 and 4 enlarged) *in situ*, cohering to the elongated axis of the receptacle.

It will be observed upon examination that the ovaries are in fact a hard-shaped sheath enclosing the seed, the surface of which is covered with short stiff hairs or small bristle-like spines visible to the unaided eye, but of course more conspicuous through a common lens. The tip of the hard is also peculiarly pointed and curved; produced from the upper end of the ovary (that opposite to the tip) is a thread-like process or style an inch or more in length, varying in different specimens, so that the ovary as a whole may be compared to a tiny arrow, which it much resembles.

GYNŒCIUM AND SEEDS OF CRANE'S BILL (Erodium) OR ALFILLARILLA.

Now if we examine an unripe specimen before the sepals have separated from it (Fig. 1), we shall find four to five of these miniature arrows (carpels) side by side, closely fitting together, being snugly packed around the prolonged central axis of the gynœcium, the base of which is sufficiently expanded or swollen to receive the tips.

After the blossom has withered and the ripening process advances, it will be found that the arrows (ovaries) in these little bundles, or quivers, if it be allowable to so name them, exhibits a tendency to separate from the central stalk or axis of the receptacle, first curling upwards and finally falling off, or are blown out and distributed by the wind.

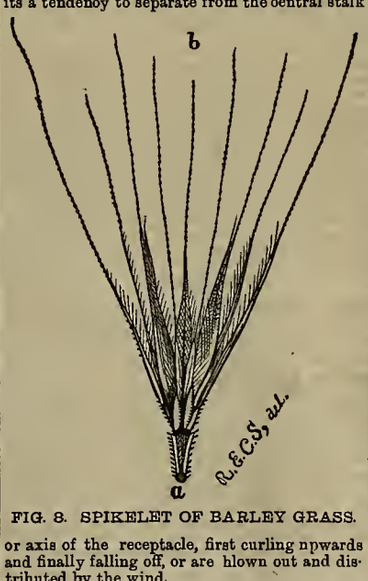

FIG. 8. SPIKELET OF BARLEY GRASS.

As soon as the ovaries are detached as above, their styles commence twisting (See Figs. 5, 6 and 7), and the delicate threads, as seen upon and along the slender shaft or style, are consequently thrown out at an increased angle (sometimes at a nearly right angle), so that the entire ovary now presents somewhat the appearances of the skeleton or frame, as it were, of a parachute, which after a breeze has passed and the air is calm, causes it to descend vertically, hard downward, so that the tip first touches the ground; the end of the tip is also barbed, so that if the soil at the spot where it slights is at all loose, it holds on. If the weather is dry the style or awn becomes still drier, which causes it to twist still more, and the torsion caused by increased desiccation, turns it deeper and deeper; while if the atmosphere becomes damp or rain occurs sufficient to moisten the slender style, though but little moisture is required to relax the torsion, the hits or grip previously made is not lost, because with the softening of the style the barb or ovary is not twisted out; whatever hold has been gained is retained, and the torsion renewed with recurring desiccation, and so the process of planting goes on.

The small bristles on the surface of the ovary or sheath are set obliquely upwards to the axial length and assist in the process of planting. It will be seen that every alternation of atmospheric conditions, characterized by positive moisture or dryness, assists in the operation.†

The luxuriant growth of the cultivated geraniums in California is well known. In and around Berkeley nearly every yard has many plants of one or more varieties. On my premises are numerous vigorous plants of large size and of many varieties, including Pelargoniums.

The question naturally occurred, why have not these ornamental forms which have the great advantage over their wild relatives of the protection and fostering care of man, spread like the unprotected *Erodium* and divided the field with it or driven it out? The seeds are not infertile, for under the shade of the sturdy plants which produce them, protected during the hot dry summers by the leaves which fall from the parent plant and make the thin mulch which covers them, with infrequent and slight sprinkling during the long rainless season, hundreds of young plants may be seen in the fall which have sprung from the loose and slightly moistened soil and acquired their second pair of leaves. The carpels are of the same form as those in *Erodium;* few persons could detect any difference, and the awn or style twists in the same way. Upon critical examination, however, it was found that the tip (insertion point) of the carpel was covered with *soft silken hairs instead of rigid bristles*, too soft to act as barbs, and the insertion point is neither as sharp or stiff nor curved the same as in Erodium.

The seeds of all these foreign forms which have been examined by me in this connection, are apparently dependent for distribution chiefly on the winds, for the delicate filaments along the style if not longer are more numerous than in Erodium, so that when the twist or torsion has occurred, they present a form well adapted for distribution by flight.

Darwin has noticed the advantage which winged seeds have in this respect, as well as those plants whose seed cups or receptacles have a rough exterior, which get caught in the hair or fleece of animals and are thereby transported from place to place. In this way also the seeds of the geraniums have some advantage, but as compared with those of Erodium, so far as planting by natural methods is considered, the advantage is conspicuously in favor of the latter.

I do not know how it is with the cultivated varieties referred to in their native country, neither can I assert how it might be with our Erodium forms if transplanted to another region; a different environment might induce a gradual modification in those peculiarities which in the environment of Berkeley are important factors in their propagation and the extension of their geographical domain. It is not difficult for a person who is familiar with the cultivation of plants, and who has had an experience covering widely separated regions with different soils and climates to conceive of conditions which might give to Erodium a rank, succulent and tender growth, which, continued for a few years, might differentiate the rigid bristles and barb of its ovaries in the direction of greater flexibility; or, on the other hand, to modify the soft nap or pile on the surface of the ovaries, as well as the flexible tip of the foreign geraniums in the direction of rigidity or spine-like stiffness. Those influences which induce succulent or ligneous tendencies in plants are to a great extent the factors in such variation.

The seeds of geraniums found in the highlands of Uruguay, as well as the seeds of certain other plants, exhibit the same interesting peculiarities.

Notwithstanding the browsing of cattle the Erodium gained upon the previously conspicuous forms. Within the past two years, however, it has been losing ground, in some places more rapidly than in others, through the conquering advance of another plant, a form which, being not only worthless as food but repugnant to cattle, is not molested by them in its onward march for supremacy, which over large areas it has already achieved, to the nearly total exclusion of Erodium.

This latter is what is known as barley-grass, or false barley, *Hordeum maritimum*, of which a spikelet is shown in the following Fig. 8.

Upon a careful examination it will be seen that the entire spikelet throughout is closely set either with short rigid bristles (as on the glumes and palea) or with minute sharply-pointed barbs as exhibited in the awns throughout their entire length, and on the edges of the arrow-shaped base or stem (insertion point) of the spikelet. Upon the long bristle-like awns these barbs are closely set, but are so very small as not to be at first detected; on pulling one of them through the fingers in a direction from the tip, *a*, towards the extremity of the awn, *b*, no difficulty is encountered, it may be done with ease; but on pulling it in the opposite direction, namely, from *b* towards *a*, resistance ensues from the multitude of minute barbs, and the effort, if persisted in, results in the breaking of the awn.

The spikelet as a whole may be regarded as a wonderfully ingenious, compound and effective barb, having through the angle of its various parts and the length of the awns, all of the advantages of the parachute form which Erodium and the cultivated geraniums referred to derive from their twisted styles with fine lateral hairs, for floating in the air *and for poise in ultimate descent.*

The principal advantage which Erodium has over this Hordeum is in the hygroscopic torsion of the styles* or awns; this is more than balanced by the preponderance of barbs and bristles in Hordeum, all of which are set at some angle outward and upward, while the spoon-shaped basal nib, arrow-head or insertion point, whichever it may be termed, is perhaps equally well adapted as the same part in the carpels of Erodium, for hiting and holding on; once inserted, every motion it receives, whether from the wind or other source only inserts it deeper and deeper, and in this the nib or insertion point is assisted by the other parts of the spikelet. Another and probably the chief advantage which the barley-grass has over Erodium is in the greater number of seeds (three in a spikelet) *"and 15 to 30 spikelets in a single head"* in a single plant; recurring again to the fact that cattle dislike it on account of its wiry, prickly character, which gives it almost perfect immunity or protection from their browsing, it is easy to perceive why it has become nearly if not "quite master of the situation."

To the farmer it is a pest and to the pedestrian a nuisance, as the spikelets stick into the trowsers around the foot, working in deeper and deeper with every motion, often crawling upwards as far as the top of the boot-leg, where if the stocking is long and extends above, it catches and follows down into the foot, irritating the flesh and compelling a halt in order to remove the annoyance.

Under a microscope lens the main barb (insertion point or nib) is an interesting and curious object; the unshaded edges (see figure) and the tiny barbs upon the same are translucent, being nearly pure silica; so also are the minute barbs upon the awns; and the short bristles on the surface of the ovaries in Erodium resemble, in miniature, the spiny bones in the dorsal fin of a perch.

Other bearded or barbed-seeded or rough-burred plants have increased in several places within the region referred to in this paper, among these are the burr-clover (*Medicago denticulata*) and the thistles (*Centaurea melitensis* L., and *C. solstialis* L.), both introduced species; the barley-grass, however, has the advantage over all others and is likely to maintain it.

---

*This paper was first prepared for the *American Naturalist*, to which journal and to the author we are indebted for the permission to reproduce it at this time.—Editors Press.

†Thus *Madia sativa*, popularly or unpopularly known as "tar-weed," and obnoxious to pedestrians on account of its gummy exudation which injures clothing, though inconspicuous in early summer, later in the season becomes a prominent plant.

*In 1875, 1,013 centals, valued at $4,849; 1876, 5,458 centals, valued at $18,314; 1877, 5,065 centals, valued at $15,412; and in 1878, 7,552 centals, valued at $21,039, were exported to foreign countries, making a total for the four years of 19,088 centals of the value of $60,254.

†Cattle eat these readily and appear to be fond of them, but the latter species especially is not a desirable plant for milch cows, as it gives a disagreeable odor and taste to the milk.

‡It is presumable that the Spanish name *Alfillarilla* was suggested by these delicate filaments.

†This is easily illustrated by the following simple experiment: Take a tumbler and fill it with sand; select specimens of the gynœcia or receptacles which are beginning to turn brown or approaching ripeness, that is while the seeds complete with barb and shaft are straight; place the barb sufficiently deep into the sand so that its tip is fairly set; it will soon be noticed as the ripening progresses, as the awn or shaft begins to dry that it also begins to curl or twist, and that in curling it buries the barbed ovary deeper and deeper, as turning a corkscrew carries the same deeper and deeper into a cork.

*"A wild oat * * * * * the *A. sterilis* of botanists, is remarkable for the hygrometric properties of the seed. Two grains usually grow together, and they have a stout, bent and twisted awn. When the oat is ripe it falls out of its glume, and in warm, dry weather may be seen rolling and turning about on its long ungainly legs as they twist up in consequence of their hygrometric quality. They turn and tumble about till their awns are so twisted that they can twist no further. They then remain quiet till the dew falls, or they are moistened by a shower, when they rapidly untwist and run about as if anxious to escape from the wet."—*Baird's Dict. Nat. Hist., p. 27.*

Miners everywhere at work with a full supply of water—all they can conveniently handle. It now seems certain that the mining season will extend far into July and possibly to August.

One of those men who cheat others on mining shares and make their living by swindling, was shot dead in Leadville about a week ago. Death loves a mining shark.

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions* rendered upon patent cases in litigation, for the benefit of our readers:

ACTING COMMISSIONER'S DECISIONS.

Hedges vs. Daniels.—Padlocks.

Appeal from the Examiner of Interferences. Decided Jan. 5, 1880. Doolittle, Acting Commissioner:

1. Neither under the old rules nor now can the Examiner of Interferences dissolve an interference in view of *ex parte* affidavits setting forth public use of an invention as a bar to the application of contesting parties.

2. Rule 75 provides for the rejection of an application, by the Primary Examiner on the grounds of public use or sale, and permits him to consider affidavits or depositions supporting or traversing such an objection.

3 Rule 120 provides that, upon the attention of the Commissioner being called by the Examiner of Interferences, or the Examiners-in-Chief, to a statutory bar to the grant of a patent to either party, he may suspend the interference and remand the case to the Primary Examiner for the consideration of such objection.

The interference remains suspended until the *ex parte* question is decided. Motion denied.

COMMISSIONER'S DECISIONS.

Farmer vs. Brush.

Interference—Metal-coated carbons for electric lights. Decided Jan. 6, 1880. Paine, Commissioner:

1. A conception which is a mere abstraction, not connected with acts or words, is not the conception with which the law permits an inventor to connect his reduction to practice by proof of intermediate diligence, so as to carry back to it the date of his completed invention.

2. The race of diligence commences with the second conception and ends with the reduction to practice by the inventor first to conceive the device. Neither public use nor an application for a patent is necessary to the completion of the invention.

3. If the inventor first to conceive effects his reduction to practice before he files his application or introduces the invention to public use, the interval between the reduction to practice and the filing of the application, or the introduction of the device to public use, is not embraced in the period covered by the so-called race of diligence.

4. While lack of diligence in filing an application for a patent or in communicating the completed invention to the public may enter as a vital element into the question whether the completed invention has been abandoned or forgotten, it cannot operate *ex post facto* to undo the consummated work of completing the invention.

5. If an inventor abandons or forgets his invention before its public use, it may become the property of a subsequent inventor. Abandonment, in the sense in which the term is here used, is the cessation of all effort to confer upon the public the benefits of the invention. Such abandonment may be voluntary and absolute, as when the invention is deliberately thrown aside with a purpose never to resume it; but it may also occur when the invention is thrown aside, not with a purpose never to resume it, but without any purpose to resume it.

6. The question of abandonment is not one of mere mental operation. Proof of a mental purpose to give the public at some future time the benefit of the completed invention, unaccompanied by corresponding acts or words, will not necessarily overcome the presumption raised by acts of a party tending to show a purpose to abandon the invention.

7. A mere delay of two years in the application for a patent is not evidence of abandonment; but neglect to confer the benefits of the invention upon the public, whether it is or is not accompanied by neglect to apply for a patent, is evidence of abandonment.

8. An inventor may abandon or forget his invention, and then resume or recall it before another makes the invention; but his rights will not, in such case, relate back to his original invention so as to give him benefit of its date as against rival inventors.

On the ground of abandonment by Farmer, priority is awarded *pro forma* to Brush.

Hamilton vs. Kingsbury et. al.

U. S. Circuit Court, Northern District of New York. Decided Nov. 7, 1879. Blatchford, J.:

1. A license exclusive within a limited territory as to all the privileges secured by the patent, with the single reservation of a right in the grantor to *make* the invention, fails *pro tanto* to be a conveyance of the *exclusive* right within the meaning of the law of 1836, providing for the record of such conveyances in the Patent Office.

2. Not being *exclusive*, its record in the Patent Office is not such notice to purchasers that they can safely rely upon the record as showing the whole transaction between the parties to the instrument in respect to its subject-matter.

3. *Hence*, certain unrecorded written agreements contemporaneous with the license, and like it not necessary to be placed on record, were held binding upon the assignees of the license, although they were *bona fide* purchasers, without actual notice of any agreement between licenser and licensee other than the license itself.

The plea is overruled, with costs to the plaintiff to be fixed, with leave to the defendants to answer, or pay most of such costs within thirty days after service of a copy of the order to be rendered in this decision.

* More complete reports of the proceedings may be found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street.

MINING prospectors have begun to enter the Ute Reservation and already commenced to stake out placer claims and to put up ranches. It is feared that a conflict between the authorities and the prospectors will be inevitable, as Secretary Schurz declares that squatters will not be allowed to enter the reservation until the gentle Utes takes his *adios*, and that, if necessary, trespassers will be expelled by the U. S. troops. Mr. Schurz made similar threats when the miners penetrated the Black Hills, but they did not prevail against the hardy adventurers who went there in search of wealth and found it. They anticipated the Government then and they are likely to do it again. If Mr. Schurz wants to prevent trouble in the Ute country he had better hasten the departure of the Utes, so that the reservation may become public lands; if he does not, the miners will make short work of the Utes and their reservation.

POVERTY OF WEALTH-DISCOVERERS.—Marshall, the discoverer of gold in California, is in his old age, a pensioner on the bounty of the people of the State which to him more than anything else owes its greatness and prosperity. Comstock, the discoverer of the wonderful lode which bears his name, ended his life in poverty and privation in the wilds of Montana, and not even a simple headboard marks the last resting place of the man whose discovery has added so much to the wealth and luxury of the human race. Coltou, the discoverer of the "Bobtail" lode, in Colorado, which has yielded millions of dollars, is passing the evening of his days on a little ranch on the Platte, where he is barely able to make a living.

USEFUL INFORMATION.

Home-Made Soda Water.

The artificial seltzer water, made with a carbonic-acid generator, is already an imitation, far from perfect, of the natural water. A recipe to make it on the small scale for family use, as it were, can only give a product differing still more from that of the spring. Yet the following would fairly imitate the taste and properties of the natural water:

Fused chloride of calcium	4 grains
Chloride of magnesium	12 "
Chloride of sodium	15 "
Citrate of iron	½ "
Tartaric acid	2 drams
Bicarbonate of soda	2½ "
Water sufficient.	

Dissolve all the salts, except the tartaric acid and bicarbonate, in about one pint of water, and introduce the solution into a champagne bottle. Then, having completed the requisite quantity of liquid so as to leave an empty space of about two fluid ounces, add the tartaric acid, and, immediately after, the bicarbonate of soda. Cork the bottle tightly, secure the cork with stout cord, and set the bottle aside for about six hours before it is opened. It is then ready for use.

ROLLING AND POLISHING LEATHER.—A new form of rolling and polishing machine for leather has been designed by Mr. J. A. Brown of Exeter, England. In this arrangement a pendulum is used for carrying the polishing-roller. Instead of this roller being depressed to bring it to bear upon the work, which is placed upon a segment-shaped bed below it, the work is raised and maintained in contact with the swinging-roller, and dropped at pleasure out of contact with the same. The pendulum carrying this roller is pendent from an arched frame, and is actuated through its connection with a rotating crank. Below the roller is a segment-shaped bed, which is carried by an elastic table. Below this bed and connected therewith is an arrangement of knuckle-jointed or toggle-levers supported on the base of the machine. The straightening of these levers will lift the bed to its highest position. These levers are connected by a horizontal rod to a rocking-arm, on the axle of which is a treadle. By depressing this treadle, the axle will be rocked, and the rod which connects with the toggle-levers being thrust forward will cause the levers to raise the bed towards the swinging-roller. If, now, a butt of leather be laid upon the bed while depressed, and a reciprocating motion imparted to the pendulum, the attendant has merely to depress the treadle, and the leather will be brought up under the action of the reciprocating roller. The amount of pressure put by the attendant on the treadle will determine the degree of severity of the action of the roller upon the leather; and, by modifying this pressure to suit the work in hand, the amount of compression and the degree of polish imparted to the leather may be determined with great accuracy. Very nearly the same thing has been used in the Eastern States for half a century, designed especially for polishing marbled paper, etc.

BLACK DYE.—This is for either wool, hair, fur, or silk. Boil the articles for two hours in a decoction of nutgall, and afterwards keep them for two hours more in a bath composed of logwood and sulphate of iron; keep during the whole time at a scalding heat, but not boiling. During the operation they must frequently be exposed to the air. The common proportions are five parts of galls, five of sulphate of iron, and thirty of logwood for every hundred of cloth. Sometimes a little acetate of copper (verdigris) is added to improve the color. Woolen cloth, before it receives a black color, is usually dyed blue; this renders the color much fuller and finer than it otherwise would be. If the cloth is coarse, the blue dye may be too expensive; in that case, a brown color is given by means of walnut shells. Silk is dyed in the same manner as wool, except that as it imbibes a large quantity of tannin, the quantity of galls must be increased to twice as much, and the silk must remain longer in the solution.

FOR EBONIZING cherry wood, Brazil wood, powdered nutgall and alum are boiled in the water until a blackish color is obtained; the liquid is filtered and applied to the wood, which is then next washed in a liquor made by digesting strong vinegar and a little oil of vitriol for some time with excess of iron turnings; thoroughly wash the wood, dry and oil. For staining fine woods the following is applicable: 4 ounces of gall-nuts, 1 ounce powdered logwood, ½ ounce green vitriol, and ½ ounce verdigris are boiled with water, and the solution, filtered hot, is applied to the wood, which is then coated with a solution of 1 ounce fine iron filings dissolved by a digestion in a small quantity of hot wine vinegar.

NOVELTY IN CUTLERY.—Chester Brothers, of Sheffield, England, have brought out a novelty which, says *Martineau's Journal*, can be added to any kind of knife without making it larger. It appears like a "blade"—but it would be more accurately called a small tool capable of doing a variety of things. It does duty as a cartridge extractor, a pin-fire spanner, for screwing or unscrewing striker, nuts or nipples of guns, and a file, which may be used for cutting wire, particularly of champagne bottles.

REMEDY FOR THE RATTLING OF A HOT WATER BOILER.—When a coil is used in a stove instead of a waterback the diameter of the pipe should not exceed a certain proportion to its length, with the fewest possible turns, that the water as it warms can pass rapidly to the tank or boiler, and not be retained long enough in the coil to form steam or to get nearly as hot as it is possible, consequent with the pressure. Thus, short pipe, large diameter, with one bend, or water back with one certain, or if a chamber only, the water will take care of itself, according to gravity. Rattling will be sometimes caused in a very hot tank when the pressure is relieved by drawing, on the same principle as water below 212° boils in a partial vacuum.

STRAIGHTENING HARDENED STEEL.—In hardening and tempering tools they sometimes spring, to the great annoyance of the workman, and not seldom the tool is reheated and rehardened. In most cases this may be avoided. To straighten a piece of steel already heated and tempered, heat it lightly, not enough to draw the temper, and it may be straightened by blows from a hammer, if the character of the tool will admit of such treatment, or, as in case of a tap, it may be straightened by a heavy mallet on a hard wood block. Although the steel when cold would break like glass with this treatment, when slightly warmed it will yield to moderately heavy blows unbroken.

MALLEABLE BRONZE.—According to a recent German patent taken out by M. Dronier, malleable bronze may be obtained by the addition of a small quantity—from ½ to 2 per cent.—of mercury. It may be added to either of the metals of which the alloy is to consist (being poured into the fused metal and stirred with it); or it can be introduced along with the tin, or soon after it, into the copper bath.

TO DILUTE hay rum use dilute spirits instead of water. When water is used the combination assumes a milky-white appearance and is utterly devoid of the usual odor given out by good hay rum. This is due chiefly to the insolubility in water of the essential oils contained in the spirits. Bay rum, when applied moderately to the hair without reducing is not injurious.

TO REMOVE OLD PAINT.—Another way to soften paint is by heat from a hot iron, or alcohol or gas flame held near it, and then scrape it off with a suitable knife or chisel.

GOOD HEALTH.

Heart Disease.

When an individual is reported to have died of a "disease of the heart," we are in the habit of regarding it as an inevitable event, as something which could not have been foreseen or prevented, and it is too much the habit, when persons suddenly fall down dead, to report the "heart" as the cause; this silences all inquiry and investigation, and saves the trouble and inconvenience of a repulsive *post mortem*. A truer report would have a tendency to save many lives. It is through a report of "disease of the heart" that many an opium eater is let off into the grave, which covers at once his folly and his crime; the brandy drinker, too, quietly slides round the corner thus, and is heard of no more; in short, this "report" of "disease of the heart" is the mantle of charity which the politic coroner and the sympathetic physician throw around the grave of "genteel people."

At a late scientific congress, at Strasburg, it was reported that of 66 persons who had suddenly died, an immediate and faithful *post mortem* showed that only two persons had any heart affection whatever; one sudden death only, in 33, from disease of the heart. Nine out of the 66 died of apoplexy, one out of every seven; while 46, more than two out of three, died of lung affections; half of them of "congestion of the lungs"—that is, the lungs were so full of blood they could not work, there was not room for air enough to get in to support life.—*Hall's Journal of Health.*

How to Apply Fomentation.

Good Health says: "One of the best remedies known for bruises, sprains, boils, neuralgias, rheumatism, gout, colic, and a host of maladies we might name, is fomentation; but it must be applied thoroughly. The first thing requisite is a soft flannel of a sufficient size to well cover the part to which it is to be applied after being folded four thicknesses. Fold as to be applied, and then dip in very hot water, lifting it out by the corner and placing it in the middle of a towel. Roll up quickly lengthwise of the towel, and wring nearly as dry as possible by twisting the ends of the towel. In this way the fomentation can be wrung out much hotter than with the hands. Of course it will be too hot to apply to the bare flesh; but do not waste heat by letting it cool. Protect the skin by one or more thicknesses of flannel and apply at once, covering with another dry flannel. The fomentation will gradually warm through, and will retain its heat two or three times as long as when applied in the ordinary way.

"When heat is required a long time, a bag of hot meal, hot salt, or sand, a hot brick or bottle, or, best of all, a rubber bag filled with hot water may be used, being covered with moist flannel when moist heat is necessary. When a fomentation is wanted quickly, it may be prepared in half a minute by wringing a flannel nearly dry out of cold water and wrapping it around the stove-pipe, or holding it against the side of the stove. If the stove has been recently blacked a thickness of newspaper should be placed between the wet flannel and the hot surface to keep the flannel clean.

"Poultices usually act essentially the same as fomentations, being most useful where moisture and heat are needed for some hours, as in the case of boils and felons. The ordinary way of applying is troublesome and inconvenient. Here is a much neater way: Make a little bag of proper size to cover the part to which the poultice is to be applied, of some kind of loose material, as slazy muslin. Put the poultice in this, not waiting for it to cool. To prevent burning, when first applied, place one or two thicknesses of flannel between the bag and the skin. Cover all with a dry cloth or piece of oil-silk."

Sleeping Together.

If a man were to see a quarter of an inch of worm put in his cup of coffee, he could not drink it, because he knows that the whole cup would be impregnated. If a very small amount of some virulent poison be introduced into a glass of water, the drinking of it might not produce instant death, but that would not prove that it was not hurtful, only that there was not enough of it to cause a destructive result immediately.

We sicken at the thought of taking the breath of another the moment it leaves the mouth, but that breath mingles with the air about the bed, in which two persons lay; and it is rebreathed, but not the less offensive is it in reality, on account of the dilution, except that it is not taken in its concentrated form, but each breath makes it more concentrated. One sleeper corrupts the atmosphere of the room by his own breathing, but when two persons are breathing at the same time, 12 or 14 times in each minute, extracting each minute all the nutriment in a gallon of air, the deterioration must be rapid indeed, especially in a small and close room. A canary bird hung up over a curtained bedstead where two persons are sleeping will die before morning.—*Hall's Journal of Health.*

PRESSURE OF THE BRAIN.—An American medical man was called one day to see a youth aged 18, who had been struck down insensible by the kick of a horse. There was a depressed fracture of the skull, back of left temple. The skull was trephined and the loose fragments of bone that pressed upon the brain were removed, whereupon the patient came to his senses. The doctor thought it a good opportunity to make an experiment, as there was a hole in the skull through which he could easily make pressure upon the brain. He asked the boy a question, and before there was time to answer it he pressed firmly with his finger upon the exposed brain. As long as the pressure was kept up the boy was mute, but the instant it was removed he made a reply, never suspecting that he had not answered at once. The experiment was repeated several times with precisely the same result, the boy's thoughts being stopped and started again on each occasion as easily and certainly as the engineer stops and starts his locomotive.—*Popular Science Monthly.*

OAT MEAL FOR BREAKFAST.—In the last five years the consumption of oat meal, in this country, has probably increased 20-fold. People differ so much in their likes and dislikes that we do not insist on anybody eating oat meal because somebody else does, but the great growth of its popularity is beyond doubt. Generally the Irish and Scotch meal have been considered best, but they sell comparatively high, and persons well acquainted with the subject say that Akron meal of Ohio is just as good. Oat meal should be well cooked. As it is usually made a breakfast dish, it may be soaked over night, and then boiled like mush for say half an hour, while the other part of the breakfast is getting ready. No doubt it is more wholesome eaten plain, but the temptation to use various "dressings"—generally cream and sugar—is too strong for any except very firm health-seekers. But where these are eaten it should be, as the friends say, "in moderation."

FATAL EFFECTS OF FOGS.—A single week of raw and densely foggy weather more than doubled the death rate of London, compared with the average for the corresponding week for the preceding years. The weekly reports of the Register-General show that the annual death rate had risen steadily during the three weeks preceding the foggy period from 24.6 per 1,000 to 27.1 and 31.3; then it bounded to 48.1, a rate higher than had been recorded since the cholera epidemics of 1849, 1854 and 1866. While the increase in deaths in the West End districts of the metropolis did not exceed 32%, in the crowded quarters at the east end it was equal to 83%. The largest number occurred among people past 60 years.

COFFEE IN TYPHOID FEVER.—Dr. Guilessee, of the French Navy, reports that, in the early stage of the disease, coffee is almost a specific against typhoid fever. He gives to adults two or three tablespoonfuls of strong black coffee every two hours, alternating with one or two teaspoonfuls of claret or Burgundy wine. The beneficial effect is immediate. A little lemonade or citrate of magnesia should be given daily, and after a while quinine.

The Week.

The week bas besn characterized hy the ssverest and most widesprsad storm of the season. A great deal of damage has besn done in the agricultural regions in some parts of tbe State. Some injury has been done also in the mining regions from slides, where the banks have come down and covered np the pipes, etc. In many places in tbe hydraulic mines, however, these big slides will in the end he hetter for tbe miners, since the breaking np of the masses of gravel by the rains will ohviate the necessity of nsing powder. The heavy hanke of snow in the monntains will insnre a first-class mining eeason, eince there will be plenty of water all anmmer. The storm has heen very widespread.

The Legislatnre adjonrned at the close of last week, and we give, in another column, the concluding husiness of the session.

The etorm bas heen eo severe tbat there has heen little traffic on the roads. Bullion ehipments from the minee have, therefore, not heen made to any extent.

MINES IN WISCONSIN.—We see hy the dispatches that the news from Ashland, Wis., is to the effect that the gold and silver minee discovered in that vicinity a few months ago are now heing worked by Hugh McDongall and others, of Chicago, as eecretly as possihle, and are panning ont beyond all expectations. There is great excitement over tbe epecimens forwarded to Chicago.

A TERRIBLE burricane occurred in Miseouri on Monday. The town of Marshfield was hlown down, and the ruins catching fire, some 40 or 50 pereone were killed. The towne of Granby, Warrensburg and Cnha were also seriously damaged.

PART of the lattice work of the Tay hridge has been recovered. It bears marks tending to enstain the theory of Sir Francis Bonch, chief engineer and projector of the bridge, that the train went off the track hefore the bridge fell.

Better Than Bonanzas.

Now, wben the Comstock is at sncb low ebb and the great minss of Colorado are proving so short-lived, is a good time to call the attsntion of monied msn, hoth at home and ahroad, to certain of the nsglected gold deposits of California, which, if they should not yield for the first year or two as do these evanescent bonanzas, possess at least the quality of endurauce—deposits that, while they may not, like these great propsrties, speedily enrich the first, will he less apt to impeverish the second set of investors. We allude here to the hydraulic tailings that at a few poiuts have accumulatsd nnder conditions favorable for a sscond handling, and to ths auriferous flats that have not yet been worked ont, owing to the difficulty of effectiug tbeir thorongh drainage. The debris from the hydraulic mines of California has either been carried down into the larger rivers and swept away, or it has made lodgmsnt in and along the heds of the streams up nsarer the mines. Only a small portion of thsse deposits can, however, he rewashed to advantage owing to thsre heing insufficient fall imsdiately helow them to admit of their bsing run off. In the few localities whers tbere is fall enough for this pnrpose, they can he utilized with profit, the business having paid wsll wherever undertaksn; strangs to say, however, some of these localities, few as they are, still remain neglected. In one case at least, the hed of the npper Bear river, this nsglect has been due to the heavy expenditure needed for preliminary preparations, though there is little doubt hut the amount of monsy so required would in the snd prove a good investment. However that might he, there certainly are several othsr points where an entsrprise of this kind could bs inaugurated and in a very short time made to return unintermitting and, so to speak, endless profits, one of these hsing Shirttail canyon in Placsr, and anothsr Slate creek in Sierra connty, at neither of which would any large sum be required to effect a successful movemsnt of thsir contents.

While the mors availahle tailing deposits of California are so limited in number, the other class of gold-containing deposits mentionsd—ths undrained flats—are hy no msans numsrous, the most noted as well as the largest and richest of these being tbe extensive deprssion situate nsar the center of Trinity county and known as Weaver hasin, some of the leading features of which, togethsr with a project designed to sffsct its partial drainage, wsrs outlined in these columns a few months ago, recurrence to the snhject heing now had hecause tbat entsrprise has since hesn so advancsd through the acquisition of additional mining ground and water rigbts and a further perfection of working arrangemsnts, as to greatly increase its chances of ultimate success, some minor engineering difficnlties that prssented thsmselves at the start having in the interim hssn effectually disposed of.

Weaver hasin, which contains ahout 12,000 acres of deep placsrs, is completely encircled hy rugged hills and lofty monntains, all auriferous, has in times past yieldsd enormous quantities of gold dust, having been one of the most prolific spots in the Stats. Under active gravel washing for ovsr thirty years, the tailings have eo accumnlated in and along Wsaver creek, the only outlet to this hasin, that hydraulic operations on a large scale can no longer be prosecuted thsre to advantags, even hand sluicing heing much impeded for want of fall. Anticipating these troublss, a capacions flume was ssveral years since commenced and gradnally extended down this creek in the expectation that it wonld effect a riddance of this ohetructing material and prove at the same time remunerative ae a gold-eaving apparatue. Bnt while securing to eome extent tbe latter ohject, thie flnme failed to afford any appreciahle relief against the principal trouhle; the sediment, for want of fall, conetantly choking it up at its lower end.

In this emergency Wm. S. Lowden, a pioneer settler iu Trinity county, devised a plan for accomplishing hoth these ends by means of a deep drain tunnel to he started from a point on Weaver creek a few miles below the hasin and extended thence west to Trinity river. This tunnel completed, the rich tailinge that have gathered in this locality could he rnn off and relieved of their gold as well also as a stratum of enrface gravel nearly 200 feet thick, the whole of which wonld yield immensely under hydranlic washing. Mr. Lowden, wbo has resided in Weaver hasin for 30 years, occnpying mnch of the time tbe position of connty enrveyor, and laterly aleo that of United States depnty mineral enrveyor, has epent much time in originating this echeme and perfecting its details, having also expended a good deal of money in secnring such tracts of mineral lands, rights of way, water franchisee, etc., as were indispensable to its economical execution and financial succees, the whole heing now in a condition to invite the inepection of capitaliets, to whose favorable notice enterprises of this cbaracter strongly commend themeelves.

A HEAVY snowelide occurred a few days ago at Mineral King district, where the boarding house of the employeee of the Empire mine was crushed in. None were killed bnt several were iujured.

Close of the Legislative Session.

The session of the Legislature of California closed last week. Before adjonrument, the Brannhart mining bill, to which we have several times referred, was defeated.

The Felton hill, for the protection of stockbolders in mines, was passed. Its provisions are as follows:

SEC. 1. It shall he tbe dnty of the secretary of every corporation formed undsr the laws of tbis State for the purpose of mining, to keep a complete sst of books, showing all recsipts and expenditures of such corporation, tbe sources of such receipts and the object of sncb expsnditures, and also all transfers of stock. All books and papers shall at all times during husiness hours hs opsn to tbe inspection of any houa fide stockholder; and if any stockholder shall at any time so reqnest, it shall he the dnty of the secretary to attend at the office of said company at least one honr in the day ont of regular bnsiness hours, and exhibit such books and papers of ths company as such stockholder may desire, who shall be entitled to he accompanied by an expert; and he shall also be entitled to make copies or extracts from any snch books or papers. It shall bs the dnty of the directors on the first Monday of each and every month, to cause to bs made an itemizsd account or balaucs sheet for the previons month, embraciug a fnll and complete statement of all disbursements and recsipts, showing from what sources sncb receipts were derived, and for what and to whom snch dishursemsnts or payments were made, and for what object or purpose the same were made; also, all indebtednsss or liahilities incnrred or existiug at the tims, and for what the same were incurred, and the halancs of money, if any, on hand. Such account or balance sheet sball be verified under oath hy the presidsnt and sccretary, and posted in some cuspicuous plac in the office of the company. It shall he the duty of the supsrintendent, on the first Monday of each month, to file with the secretary an itemized account, verified under oath, showing the nnmbsr of men employed under him, and for what purposs, and the rate of wagss paid to each one. He shall attach to such account a full and complete report, nnder oath, of the work done in said mine, the amount of ore extracted, and from what part of the mine taken, ths amount sent to mill for redncticn, its assay value, the amount of hullion rscsived, the amount of hullion shipped to the office of the company or elsewbsre, and the amount, if any, rstained by the superintendsnt. It shall also hs his duty to forward to the office of the company a full rsport, under oath, of all discovsries of ores or miusral-hearing quartz made in said mins, whether hy horing, drifting, sinking, or otherwise, together with tbe assay valus thsreof. All accounts, rsports and correspondencs from the snperintendent shall be kept in some conspicuons place in the office of said company, and hs open to the inspsction of all stockholders.

SEC. 2. Any bona fide stockholder of a corporation formsd nnder the laws of this State for the purpose of mining, shall bs entitled to visit, accompanied hy his expert, and examine the mine or mines owned hy such corporation, and every part thereof, at any time he may see fit to make snch visit and examination; and when sncb stookholder sball make application to the president of such corporation, he shall immediatsly cause the sscretary thereof to deliver to sncb applicant an order, nnder the seal of the corporation, directed to the superintendent, commanding him to ehow aud exhibit such parte of said mine or mines as the party named in said order may desire to visit and examiue. It ehall he the duty of the superintendent, on receiving snch order, to furnish such etockholder every facility for making a fnll and complete inspection of said mine or mines, and of the workings therein. It ehall he his duty also to accompany said stookholder, either in pereon, or to furnish some person familiar with said mine or minee to accompany him in his visit to and through each mine or mines, and every part thereof. In case of the failnre or refusal of the superintendent to ohey such order, such stockholder ehall be entitled to recover in any conrt of competent jurisdiction against such corporation the enm of $1,000, and traveling expenees to and from said mine as liqnidated damages, together with costs of euit. In case of euch refusal it ehall he the dnty of the directors of sncb corporation forthwith to remove the officer so refnsing, and thereafter he ehall not be employed directly or indirectly hy ench corporation, and no salary shall he paid to him.

SEC. 3. In case of the refnsal or neglect of the president to canee to be issued by the eecretary the order in the eecond eection of this act mentioned, such etockholder shall he entitled to recover against said president the sum of $1,000 and costs, as provided in the last eection. In case of the failure of the directore to have the reports and accounts current made and posted as in the first eection of this act provided, they shall be liable, either eeverally or jointly, to an action hy any stockholder in any court of competent jnrisdiction complaining thereof, and on proof of euch refusal or failnre, eucb complaining etockholder ehall recover jndgment for $1,000 liquidated damages, witb coeta of snit.

SEC. 4. All acts and parts of acts so far as they do conflict witb this act are hereby repealed.

SEC. 5. This act sball take effect from and after its passage.

The debris bill, which finally passed botb houses, is still in the hands of the Governor, not yet having hesn signed.

Land Slides in the Hydraulic Mines of Placer County.

The storm last week was very destructive in its effects in some of tbe hig gravel mines. Land slides were very numsrous and cansed more damage tban usual. On the Forest Hill divide, several are reported.

On the eveuing of the 14th instant a slide occurred in the Dardanelles mine. Ahont ten days previous, in tbe same mine, a slide, sstimated to contain 200,000 cubic yards of earth coming from the face of a hank 400 feet higb, had destroyed ahont 500 feet of 22-inch pipe and hnried one of the giants. The slide mentioned ahove passed over the surface of this one, choked up one of the outlet tunnels, dsstroyed 200 fset of pips and demolished the lodging house which stood 700 fest from tbe original face of the bank. Soms of the men harely made thsir escaps hefore the honse was struck. But little delay in working the mine will be caused hy the slides.

The most destructive slide on the Divide was the hreaking away of ths hank in the claim of Harry Adams, ahout three miles from Forsst Hill, on tbe 12th instant. About 500,000 cubic yards of earth hroke from the facs of a hank 300 feet high, destroyed ths giant and considerahle 15-inch pipe, and as it swept down the canyon carried away and wrecked six undercnrrents and the hlacksmith shop. This mine was just ready to clean up and all the gold is lost, temporarily at least, hy the destruction of slnices and undercurrents.

Bruce & Wheeler's claim also had its slide, which filled np the olaim to the rim rock. Thsir ditch is also somswhat iujured.

Sseveral othsr minor slides have occurred, aud the hanks are in such condition tbat othsrs are liable to come at any time. Though the season's work will bs mors or lsss retarded, the brsaking np of the immsnss masses of harren oemeut and volcanic detritus which overlie the pay gravel will result in a considerahle saving to the miners.

Worthless Mines.

During ths prssent mining "boom" througbout the couutry there is no donht that a grsat many worthlsss properties will he foisted into the market. People at a distance from the properties offered should exercise grsat care in their choice, and use every prscantion possihls. It is tbe duty of tbs press to expose any scbsmes wbich they know are had onss. The Nevada *Transcript* has the following to say of propsrty now hsing offered for sale in New York:

"The Gold Bar M. Co. has hsen organizsd in New York to work the old Irousidss mine in Jim Crow canyon, Sisrra county. R. G. Bloss is annonncsd as the President. The "prospectus" issued hy the organizatiou contains one clause to the effect that ths Ironsides is as valnahle a property as the famous Sierra Bnttes mins, which is said to he in that vicinity. A statement ahounding in audaciously falss descriptions of the mine and ths present condition of its abandoned workings, would he stamped hy most people who are posted as a clear case of "expert taffy." The Ironsidee is a pretty good piece of mining property, hut the parties engaged in placing it ou the market are, we helieve, laying themselves liahle to the imputation of drawing too long a how. To make a long matter short, it may he well to state that in the *Transcript's* opinion the prospectue of the Gold Bar company ie calculated to help dispose of etock rather than to give a fair idea of the eubject treated. We hope our Eastern exchanges, snch as the New York *Tribune, Mail, World, Mining News*, also the Boston and Philadelphia papers interested in the euhject of legitimate mining, legitimately conducted, will give us the benefit of their assistance in hringing thie case hefore the public. It is high time that attempte to mislead the Eastern puhlic with exaggerations he stopped, and we propose to see that they are so far as Nevada and Sierra counties are concerned."

THE suit hetween the Dardanelles and Mayflower mining companies is on trial for the third time in the Snperior Court of Placer connty, hefore Jndge Williams, of El Dorado. Whichever wins, it is probahle that the Supreme Court will he called on to adjudicate the case.

JUDGE C. C. GOODWIN, who has for a long time had the editorial management of the Virginia *Enterprise*, contemplatee retiring from journalism and entering the husinese of mining.

IN 1878 a nngget was found within six miles of Helena, Montana Territory, valned at $1,146.80. They have heen found in Montana of as high a valne as $3,200.

Mining in Utah.

Commencement of the Business.

[Written for the PRESS.]

Mining in Utah continues to move on in a quiet sort of way, not having experienced the "boom" that is said to have visited her neighbors on the south and east, and appears to even be threatening those on the north. We look, however, for such animation here as may possibly grow into a genuine excitement the coming summer. But whether shall happen or not, the business is bound to grow and prosper, notwithstanding it has, because of the low prices of lead and other extraneous causes, been a little depressed for the past three or four years. Utah may not come up at a bound with a clang and a hurrah, but she will come up steadily, sturdily and to stay, for she has the bottom facts on which to build up this industry. While it is nearly 17 years since mining for the precious metals was first commenced in this Territory, it is only about 10 or 12 years since much capital came to its aid and the business began to be carried on with anything like intelligence and system. Not, in fact, until the transcontinental railroads were finished were the conditions here such that vein mining could be prosecuted to advantage. With the completion of these roads freights were for the first time so cheapened that machinery, tools and supplies could be brought in and ores, lead and base bullion be shipped out of the country at a moderate cost.

As the Mormon hierarchy not only restrained their own people from hunting after gold and silver, but did all they could to prevent others from engaging in the business, it would probably have been a long time before this branch of mining obtained much of a foothold in Utah had it not been that a class of men were introduced into the country whom Church authorities could not terrify and dared not molest. In the fall of 1862, the California Volunteers under General Conner arrived at Salt Lake City and founded near it the military post, Camp Douglas. As the command contained many men accustomed to prospecting and mining, these naturally enough took to the business as soon as they had opportunity to do so. Within a year they had found the placers along Bingham canyon and, when in 1864 a company of these volunteers came to be stationed in Rush valley, 40 miles west of this place, they were not long in finding the silver-lead bearing veins that abound in that neighborhood; and, when a year or two afterwards these troops were finally mustered out of service, the most of them turned their attention wholly to mining, insuring for it a more rapid growth from that date onward.

Meantime, a portion of the overland emigration having stopped here, and some prospectors come in from other quarters, a few of the Mormons having also began to pay attention to mining, prospecting spread and the business grew apace. Explorations were extended over much of the northern and central portions of the Territory, and in the course of the next three or four years many districts had been laid out and hundreds of claims taken up.

Working the Ores.

The earliest attempts at ore reduction in Utah were made by Gen. Conner, in 1864, at the town of Stockton, Rush Valley district, where a smelting furnace was erected for the purpose. A number of additional furnaces were put up both here and at other localities within the following two years. The most of them, however, resulted in failure, while none reached any large or permanent success. The majority of these structures were built of unsuitable materials, besides being defective in form or otherwise faulty in the first place. Then, the parties entrusted with the business of running them lacked the requisite experience, the cost of labor and supplies was great, and there were no facilities for shipping the more bulky products of the mines to market. Being built of adobe and sandstone these furnaces soon burned out, and becoming useless were abandoned. Hence, the many dilapidated and deserted establishments of the kind met with in this part of Utah. All through the older smelting districts the traveler notices these ruins, and, if a stranger, wonders how it is that such extensive and costly works should have fallen into disuse and been suffered to go to decay in a country so young.

In the single item of high prices alone, sufficient cause for so much failure can be found. Freights on everything brought into the country, whether from the east or the west, averaged at that day about 25 cents per pound, while the discharged troops and others who had received money in currency had to submit to a fearful discount where payment was required in gold. Labor was also expensive—for the Mormons, while willing, and even compelled, to work for their own people at $1.50 per day, exacted two or three times that amount when they worked for others, being reluctant to labor for Gentiles even at these enhanced wages. Most of the teaming was also in the hands of the "Saints," who took good care to charge well for their services when required by these unwelcome and godless strangers. Under such exorbitant charges, it was clearly impossible for mining to succeed, to say nothing of the innumerable drawbacks arising from inexperience, absence of suitable material, etc.

Having partially surmounted these various difficulties, and gotten fairly underway, mining in the Territory experienced other troubles, which, though not peculiar to the country, proved exceedingly detrimental to the business. Mines that had been abandoned, on promising to become of value were reclaimed by the first locators, giving rise to much costly and vexatious litigation, it sometimes happening that when one set of claimants had been settled with and gotten out of the way, another set would arise to harass the parties defendant. Then came the failure of the several foreign companies—mostly English—who, after investing heavily in the Territory, came out nearly all losers. The fact that these mishaps were mainly due to bad management, did not avail to save the mines of Utah from being greatly disparaged through their occurrence, very little outside capital having been invested in the Territory for several years thereafter. But, despite these disasters and consequent forfeiture of confidence on the part of people abroad, mining interests here have been pretty well prospered, and are to-day in an exceptionally healthy condition, there being in this Territory as many paying properties, in proportion to the population engaged in mining, as in any country west of the Missouri river; and while losses have here occurred in the business, they have mostly fallen on large companies, and not often on the poorer classes of the community. The assessment system, as practiced in California and Nevada, has never much obtained in Utah. The mines here, with the exception of a few large enterprises, have been mostly self-supporting from the start, superseding the necessity for taxing owners and shareholders for outfitting and opening them up. We can point here, to not only a good many paying, but also to some largely productive mines—there being several in the Territory—that turn out from half a million to one and a half million dollars per annum, fully 40% of which has consisted of net profits. Heading the list of

The Leading Mines in Utah

Is the Ontario, which to date has produced nearly $6,000,000, of which $2,700,000 have been disbursed to the shareholders in dividends. The mine is well opened, splendidly equipped, and so far from being exhausted is hardly more than thoroughly prospected, and has no doubt a long and prosperous life before it. Ranking next to the Ontario is the Horn Silver mine in the San Francisco district, followed by the Mammoth in the Tintic district, both making large and profitable production, which they will doubtless be able to maintain for a long time to come. Down in the southwestern corner of the Territory are located the Stormont, the Leede, the Christy and the Barbee mines, all young enterprises, but containing the elements of a large success, having produced over $1,000,000 last year. The Telegraph, now owned by a French company, though considered an old mine for this country, is far from being a superannuated concern. It may even be questioned whether it has yet seen its best days, the remaining ore deposits in the mine being large, and the reduction works appurtenant to the property amongst the most extensive and well appointed in the Territory. This mine is situated in the West mountain, better known as

The Bingham Canyon District,

And is surrounded by a number of valuable properties, some of them carrying, like this, smelting ores only, while others contain both milling and smelting, or exclusively free gold-bearing ores, there being also a considerable extent of placer diggings along this canyon and its branches. It would, in fact, be difficult perhaps to find anywhere another spot of like area containing such a variety of ores and deposits of the precious metals, and all occurring under favorable conditions, and in paying quantities. Lying near the Old Telegraph is the Live Pine and St. Marks mine owned by John Tiernan, and covering 17 acres secured by United States patent. This mine has been opened by an immense extent of tunnels, shafts, drifts, crosscuts and inclines, all but the tunnels, which are run in country rock, being in high-grade ore. Comparatively little stoping has been done here, the ground having been developed with a view to establishing large reserves for the purpose of determining the capacity of the works required for reducing the ores, which will have to be treated by both milling and smelting. From the samplings and workings of these ores carried on upon a large scale they are found to contain from $35 to $75 in silver and about $40 in gold to the ton, the smelting ores carrying from 15% to 30% lead. The lode averages 50 feet in thickness, and the ore developed amounts to several thousand tons. That already disposed of was sold at this place, having first been sent to the works at Sandy for sampling. The proceeds of the ore extracted from the mine have more than sufficed to cover cost of its exploitation. In the same neighborhood is situated the Yosemite, another thoroughly developed and well managed property partially outfitted, and capable of making a large bullion production. Located a little further north are

The Big Gold Mines

Of Bingham canyon, of which the following may be accounted the principal, viz: the Excelsior, Jordan, Stewart No. 1 and Stewart No. 2. No where are these ledges less than 20 feet in thickness, their average thickness being about 45 feet, 90% of the vein matter being composed of disintegrated free gold-bearing quartz, that will yield about $15 in gold and $3 in silver to the ton. To a depth of 800 feet below the croppings, this is the character of the entire contents of these immense fissures. Below that level the ore become sulphureted and, consequently, more difficult to treat. It is also believed that they will here be found much poorer and, possibly, of too low a grade to warrant their extraction. This conclusion rests, however, on conjecture, little exploration having yet been made below the line of permanent water. But, supposing the veins to be worthless below that level, these must still rank amongst the biggest gold mines ever discovered, as they must, for a long time at least, continue to be among the most profitable ever worked.

Passing west over the Oquirrh mountains, we arrive in the

Camp Floyd District,

One of the pioneer camps and most promising mining localities of Utah, notwithstanding this, like many other now prosperous districts in the Territory, has seen its era of adversity. The failure here some years ago of an English company whose affairs had been conducted with characteristic inefficiency, gave the whole region a set back, and for many a day clouded the prospects of Camp Floyd, which, through the persistent and well directed efforts of a few live companies, have only of late begun to brighten up. Among these companies, we have, first, the Carrie Steele, who have done on their extensive grounds good work, and a great deal of it, for all of which they are about to reap a rich reward. They have a mine, but it has cost something to get it, not a few days' work and a few dollars, but many of both. The labor and money expended have, however, been wisely and faithfully applied. Neither in fact could have been bestowed to better advantage. The company having demonstrated that they had a mine—that is large and permanent bodies of pay ore—determined upon providing themselves with a suitable mill for its reduction, which also has been done, and in a very few days the Carrie Steele will be placed in the rank of our large and profitable bullion-producing mines. The denizens of your city, who own, I believe, the most of this property, are to be congratulated on its prospects. In this connection, it is pertinent to say that the Carrie Steele stands endorsed by no less an authority in the mining world than Prof. J. E. Clayton, whose opinions are, in this country, considered conclusive on properties of this kind.

In the same broad mineral belt, and near the Carrie Steele, are situated the Midway, the Reno and the Leopard mines, locations somewhat opened up and exhibiting evidences of decided merit. These properties also stand approved of by Prof. Clayton, and will be very likely to figure conspicuously in the future history of this now rising district.

To the north of Camp Floyd there are in the several districts lying along the westerly slope of the Oquirrh range, well-opened and valuable mines, such as the First National, Great Basin and Legal Tender, near Stockton, the Wandering Jew at Dry canyon and others less developed but equally as promising as the above.

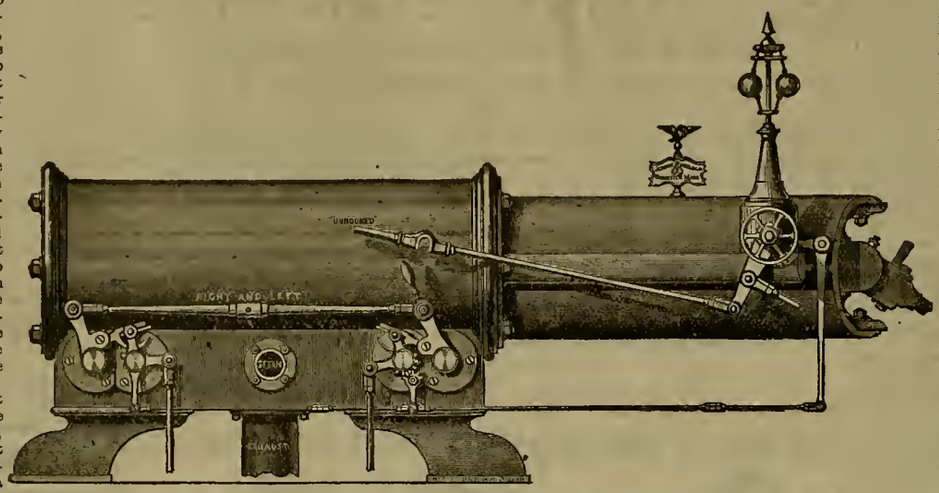

FIG. 2. SIDE VIEW OF CYLINDER OF WHEELOCK ENGINE. (See First Page.)

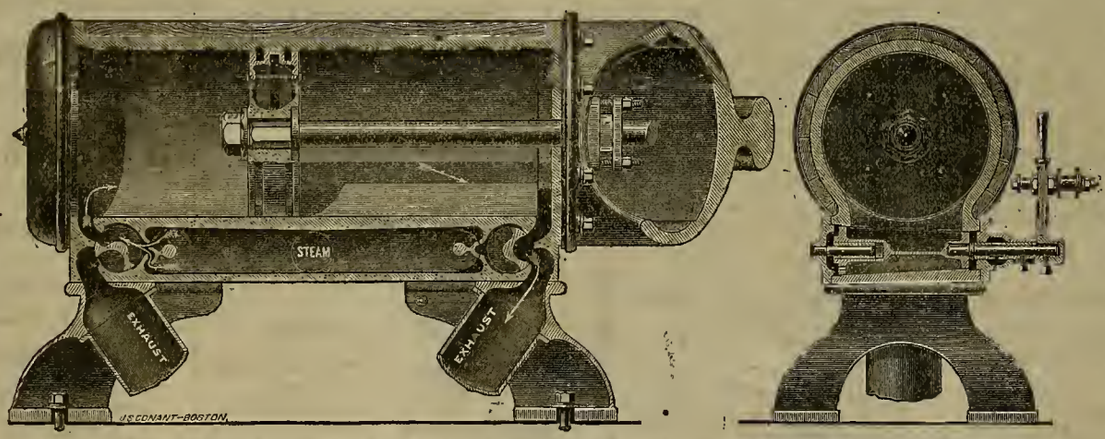

FIG. 3. SECTIONAL VIEW SHOWING ARRANGEMENT OF VALVES ON WHEELOCK ENGINE. (See First Page.)

THE CARSON MINT.—The Secretary of the Treasury has decided to resume coinage at the Mint at Carson May 1st, sufficient bullion having been accumulated to justify commencing operations. The Department is in receipt of advices leading to a belief that silver bullion will be delivered at Carson at prices paid in San Francisco.

LEADVILLE, Colorado, is said to contain 40,000 inhabitants, and 800 a day arriving. Most all the new comers are from the East.

THE Silver Cloud mine, of Dragoon district, Arizona, has been sold to Pennsylvania parties for a large sum.

The Julia Shut Down.

The Julia company will work through the Ward shaft. The pumping apparatus at the Julia is so dilapidated that it is liable to give out entirely at any hour, and if work should be continued at that point it would be necessary to put up new pumping apparatus. A new pumping engine would also be required, as that at present in use is pretty nearly worn out. So much heavy work has been put upon it that it squirms about upon its foundation, and the only wonder is that it did not go to pieces long ago.

In the Julia shaft are six plunger pumps between the 1600 level and the surface and two below the 1600, one of these being at the 1800 and the other at the 2000 level. As the water is only pumped up to the 1600 level, where comes in the south branch of the Sutro tunnel, the pumps above that point are not used—indeed, four of them are used up and cannot be used—except to steady the pump rod, the clacks being taken out of them. The two pumps below the 1600 level are so nearly worn out that they are likely to break down at any time.

This being the condition of the pumping apparatus, the management below have decided to make the Ward the main working shaft for the two mines and to at once commence operations from that point. The Julia company own half the Ward shaft and it is considered a needless expense in these dull times to keep up two establishments. The Julia machinery has been used to sink as far as it has strength to go; work will now be pushed through the Ward as far as the machinery at that point can be made to do the pumping, and when something more powerful shall be required it will be set up at that shaft.

The Ward shaft will be put down to the 2400 level as rapidly as possible, and when that point is reached a station will be opened from which a drift will be run to the Julia ground. The distance to be run to reach the Julia will be 200 feet. The lowest point at which there is at present any connection between the two mines is the 1800 level. Two watchmen—one for the day and one for the night—will be placed at the Julia works to look out for the safety of the property at that point.—*Enterprise.*

NOW READY!
OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.
GRIMSHAW on SAWS!
History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.
By ROBERT GRIMSHAW, Ph. D., M. E.,
Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.
This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small band, sash, Mulay, jig, drag, circular, cylinder and hand Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, lay measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed
Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid

MESSRS. DEWEY & CO.—*Gentlemen:*—I hereby acknowledge receipt of patent, for which please accept my sincere thanks. When I have any further business in this line I shall certainly employ you. With kind regards, I am, Yours very truly, CHAS. SLATTERBECK.

Kendall's Spavin Cure
Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the bunch without blistering.
Office U. S. Marshal, Western Dist. of Michigan, Kalamazoo, April 15th, 1879.
B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse restored to usefulness. Very truly yours, JOHN PARKER.
Send for illustrated circular giving positive proof. Price, $1
All Druggists have it or can get it for you.

Also, to our large and well adapted stock of

Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application.

JOHN TAYLOR & CO.

W. BRUCKNER'S
ROASTING FURNACE
AND
Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.
For circulars and prices apply to

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

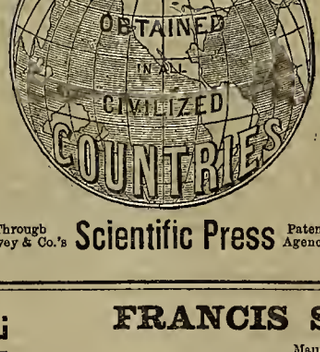
SECURE PATENTS



Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

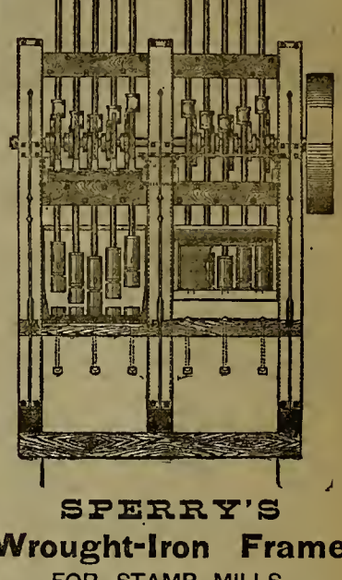
GOLD AND SILVER
Grinding and Amalgamating
MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlorodizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

QUICKSILVER

For sale in lots to suit by MAURICE DORE, Agent for the Guadalupe Mine,
410 PINE STREET, SAN FRANCISCO.

CONTINUED FROM PAGE 261.

tance of about 500 ft from the mouth, the breast of which shows two veins of solid ore about two inches thick, which contain iron and copper pyrites, one of them assaying 560 and the other 360 ounces in silver per ton. The famous La Crosse mine continues to pan out well and at present is doing better than ever before. One hundred sacks of ore are now at the mine ready for shipment. The Dictator is now owned by Col. Wm. H. Doe. The breast of the drift running from the shaft now shows a 12-inch vein of decomposed ore. The Murry mine is now owned by the Moore mining company. The first level running east shows an ore vein 18 inches thick and solid, which mills 150 ounces per ton in silver and 20% in copper. The lower level running west shows a vein from 6 to 8 inches in thickness, which mills 150 ounces in silver and 10% copper.

MILL CITY.—Everything in and around this hurg presents an encouraging appearance. A number of old prospects that have lain dormant for a number of years past bid fair to "boom" during the coming summer. Aside from the number of properties that will be worked by the Mansfield mining and milling company, of Mansfield, Ohio, we are informed by Mr. Frank L. Downend, the agent of that company, that he is associated with Mr. A. N. Ghost, of Denver, and Mr. A. T. Lewis, of Springfield, Ill., in another company, and they have already located 10 claims which they propose to work during the coming summer. It is also stated that another company is now being organized in Iowa for the purpose of working several lodes in this vicinity.

DAKOTA.

CALEDONIA.—*Black Hills Times*, April 12: The Caledonis mill started up yesterday with all of her 60 stampe dropping, and the movement of the machinery was as smooth and devoid of jar as a watch. The most sanguine hopes of the mechanics who assisted in its erection have been more than realized. It is certainly one of the best mills that has ever been started up in this or any other country.

IDAHO.

READY.—Owyhee *Avalanche*, April 15: There is a considerable quantity of rock ready for crushing at the Crane & Driggs mine, near the Golden Chariot. The last crushing of rock from this mine averaged $73 to the ton. Mr. Crane and the other parties working it intend to have about 50 tons more crushed shortly. The ledge averages from 8 inches to 1 ft in width, and shows a considerable proportion of gold. The snow is over 20 ft deep around the mine, and has been tunneled through a distance of 100 ft from the outside to the point where the ledge is being worked.

ATLANTA NOTES.—*Idaho World*, April 16: No sickness of any kind in Atlanta. Ten men are at work in the Monarch. The mine is showing up well. The Buffalo company is taking out from 4 to 6 tons of ore per day, from the 1st to the 3d level, and is crosscutting from the 5th level, the bottom of the shaft, but have not cut the ledge. This company is working about 15 men. Miller, of Buffalo, will be at Atlanta by the 15th of June to take charge of the Buffalo mine. Algewahr, the present Superintendent, is going to Wood river to engage in mining. R. B. Brown is going to put up a mill at Queen's river. He will go below in a few days to get the machinery, and as soon as it arrives, work will be commenced on the mill.

ALTURAS county will not be behind any of the other quartz camps of the Territory in the way of a boom this season. And the opinion of a great many of the old settlers of that county that she will advance further the coming summer than during any previous year.

MONTANA.

FIRST CHANCE.—*New Northwest*, April 9: From a gentleman who recently visited this district we get the following interesting account of the country and roads in the vicinity, and the mines at First Chance: The district is situated at the head of Deep and First Chance gulches and extends along the divide between Bear and Elk creek. At Bear Mount the snow is about 4½ ft deep on the level. Traveling up the gulch it increases in depth until at Beartown it is from 4 to 4½ ft deep. To get to the mines from Beartown the traveler takes the trail up Bear gulch to Cave, up Cave gulch to its head and over the steep divide between the latter gulch and First Chance. The depth of snow increases with the altitude after leaving Beartown, until at First Chance it is from 5 to 7 ft deep. A remarkable feature of the snow is that there are no drifts whatever—all lies as when it fell. It is estimated by the miners that from 12 to 14 ft have fallen this winter—an unusually large amount. The mine with the greatest amount of development is the Magone & Anderson. The lode upon which their claim of 1,500 ft is located runs nearly east and west, as do nearly all lodes in the district, and has been traced and exposed for a distance of over 3,000 ft. The owners have done work nearly all along the line of their claim. The Homestake lode of Henry Grant was also visited, and Mr. O. was found hard at work in the development of his lead. He has not reached a sufficient depth to demonstrate the full extent and character of his vein. All the indications, however, are favorable for a large, first-class gold-bearing quartz lode. Prospecting, owing to the large amount of snow, cannot be successfully conducted for several week. It is a fine field for prospectors, and the miners now owning leads there are confident that permanent arrangements will be made this season looking to the development of the camp.

UTAH.

SILVER CLIFF DISTRICT.—*Prospect*, April 14: The excavations for the Plata Verde mill are nearing completion, so that carpenters and masons will soon go to work. The Leviathan's new machinery will soon be in place and ready for business. An 8-inch vein of galena and copper has been reached in the Lucille. The Silver Cliff Smelting company will commence active operations to-day. Twelve men at the Racine Boy take out on an average of three tons per day each. Two loads of ore from the Grey Eagle to the Dora smelter, Friday, returned $100.93. A 24-ft vein of galena and spar has been struck in the Robert Burns lode, at a depth of 90 ft. At the Bull-Domingo there are about 2,000 tons of ore now on the dumps, which, when concentrated, will be worth about $200,000. The Plata Pedra mining company have put a force of men to work on the Plata Pedra mine, for the purpose of getting out a mill run of ore. This company is making arrangements to erect a mill.

AMERICAN FORK DISTRICT.—Salt Lake *Tribune*, April 15: The Silver Bell has commenced work again. They have already 80 sacks of ore on the dump of the same quality that sold last fall for $100 per ton. The Pittsburg is taking out ore as usual, but owing to the condition of the canyon road will probably not make another shipment before the 1st of May. There is some talk of this property being sold to the French company, the present owners of the Old Telegraph of Bingham canyon. The Sunday mine tunnel is being vigorously pushed. Kapper is still working away on the Orphan and taking out ore.

BOGUS dollars are in circulation, and have made their way into Stockton. This coin has a neat appearance, and produces a ring similar to that of the American dollar. The only difference in the two is in the weight, the bogus dollar weighing 30 cents less than the other.

THE Coinage Committee of Congress have decided to prepare a bill to establish a Mint somewhere in the Mississippi valley. They will break up the Mint at Carson, Nev., and remove the machinery to the location of the new Mint.

THE Idaho mine, Grass Valley, is improving in appearance, the barren zone having been crossed. Thirty-five stamps are constantly running.

News in Brief.

THE distress in Ireland is increasing.

THE forest fires in New Jersey continue to rage.

DAMAGING forest fires prevail in the wilderness region of Virginia.

THERE is a strike among the salmon fishers of the canneries on the Columbia river.

IN consequence of the distress in Hungary, 5,000 Magyars have left that country for America.

A GREAT gold excitement prevails in southern India. Remarkable discoveries are reported.

THE Southern Pacific Coast Railroad has begun carrying mails. The grand opening takes place May 1st.

THE Western File Works, Beaver Falls, Penn., were destroyed by fire on Monday. Loss, $400,000.

THE Central Pacific Railroad Company will increase the rate of speed of all passenger trains on the road shortly.

THE steamer *City of Peking*, from China, arrived in the harbor last Sunday with several cases of smallpox on board.

THE ceremony of breaking ground on the East side division of the Oregon railroad, was performed at Silverton on Monday.

THE San Francisco Chamber of Commerce has petitioned Congress to allow the continuance of Wells, Fargo & Co.'e letter service.

THE Union Pacific Railroad has made an advance of ten per cent. in the wages of its employees at their shops receiving $3 per day and under.

CALLAO has been blockaded by six steamers of the Chilean navy, and the Peruvians have been completely defeated in Los Angeles and Mosquiqua.

FOR the year ending March 31st, there arrived at New York from Europe more than 163,000 immigrants. Everything indicates increased arrivals.

BY an explosion at the Giant Powder Works, near Berkeley, on Friday of last week, 25 persons were killed. The remains were so mutilated that not one of the bodies was identified.

THE House Committee on Claims has reported a hill providing for the payment of $5,000 to A. B. Meacham, as compensation for the injuries received by him from the Modoc Indians in 1873.

THE murderer of C. W. Severance, of Marin county, was found to be the Chinese servant on the ranch. The murderer hanged himself in jail, finding that the crime had been poeitively traced to him by the detectives.

THE oil business does not seem to be on the decline. There were 368 new wells completed in the oil regions last month, which produced 6,992 barrels. In February, 278 wells were completed, yielding 4,553 barrels.

JAROSITE WITH GOLD.—We have received from Geo. A. Treadwell, of Arizona, a specimen of a very singular (if not new) mineral, bearing a very near resemblance to jarosite; hut which there is much reason to believe is either a new mineral or a new combination of minerals. Jarosite, as described in Dana's Mineralogy, is an insoluble sulphate of iron and potash or soda, as in the Norway variety. The mineral handed to us by Mr. Treadwell has not yet heen analyzed, but is now in the hands of Prof. Dana for analysis. The last July number of *Silliman's Journal* speaks as follows of this mineral: "This rather rare species occnrs somewhat abundant in the quartz veinstone of the Vulture gold mine in Arizona, whence I have received it from Mr. G. A. Treadwell. It fills cavities from the oxidation of pyrites. Fine, transparent, yellow and dark brown rhombic crystals, almost microscopic, are alternated with cryptocrystalline masses, in which occasionally are seen small, brilliant particles of gold. The Vulture vein is enclosed in walls of a schistose gneiss or mica schist, and the atmospheric decomposition of the sulphide has been so complete, that at a depth of 300 feet, only cubical cavities and a curious structure due to the removal of pyrites are observed; and the mine at that considerable depth is completely dry."

THE FIRST APPEARANCE OF THE YANKEES IN SANTA FE.—The first American who seems to have penetrated to New Mexico was James Pursley—an adventurous fur trader who found his way up the Arkansas, traveled extensively through the mountains of what is now Colorado, and finally worked his way down to Santa Fe, where he went to work as a carpenter, growing rich through high wages, but suffering always a feeling of restraint. An occasional Frenchman had appeared; but Pursley (who, by the way is credited with being the first intelligent man who discovered gold in the Rockies)was the sole citizen of the United States who was there to welcome the immortal Pike when, on that bleak March day in 1806, unwillingly tramped into Santa Fe at the head of his Falstaffian band, hatless, bootless and trouserless through a year's campaigning on the plains and in the mountains. The Mexicans were greatly alarmed by this sudden realization of the proximity of the progressive and well-armed Yankees, and their consternation resulted very unhappily for the few leaders of that conquering tide that finally should overwhelm the effete rnle of Spain in the New World; yet for a long time after Pike's expedition nothing occurred to frighten further the proud and indolent hidalgos.—*Ernest Ingersoll, in Harper's Magazine for April.*

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING APRIL 13TH, 1880.

226,445.—PHOTOGRAPHIC STAND AND ALBUM—L. Dubernet, S. F.
226,404.—SOLDERING APPARATUS—J. J. Johnson, S. F.
226,451.—BRAKE FOR HARVESTERS—J. Jones and A. Pharlss, Lakeville, Cal.
226,453.—CAR WHEEL—James F. Kelly, Virginia City, Nevada.
226,409.—MECHANICAL MOTOR—J. G. Marcy, S. F.
226,454.—VEHICLE AXLE—W. C. Partlow, Oakland, Cal.
226,421.—WINDMILL—O. Rischmuller, Oakland, Cal.
226,466.—SCREW PROPELLER—J. B. Ward, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

BRAKE FOR HARVESTERS.—John Jones and Albert Phariss, Lakeville, Sonoma county, Cal. Patented April 13, 1880. No. 226,451. In ordinary headers the wheels are made with flanges or corrngations formed transversely on the tires in order to give said wheels tractive force. It is therefore impossible to apply brakes to the wheels, since the transverse flanges or corrugations catch on the brake shoes. It nevertheless frequently happens that in hilly land accidents occur from harvesters or headers being unprovided with brakes, and the horses being unable to control the downward movement, as these implements are qnite heavy; snch occurrences are dangerous to the animals and destructive to the machines. This invention consists in providing brakes for the wheels of these implements by which their movement can be regulated in going down hill, said brakes being operated by a rod leading to a convenient point on the machine, where it may be handled by the driver.

CAR WHEEL.—James F. Kelly, Virginia City, Nev. Patented April 13, 1880. No. 226,453. In this improved wheel it is proposed to employ hard or white iron from which to cast it, and as this class of iron is impervious to any tools the wheel is formed complete and ready to be put npon the axle, with oil-holes, lugs for the cap and other requirements, simultaneously with the operation of casting. This is effected hy the employment of a slightly-tapering steel mandrel for the purpose of forming the hole to fit the axle, while the recess at the inner end of the hub and the lugs upon the other end for the purpose of receiving and locking the caps are formed by a core. The cap keeps out all dirt and retains the oil used to lubricate, and fits over these lugs and is locked by them. It may also be held hy a set-screw. By this construction wheels may be formed of hard white iron, finished ready for use in the process of casting.

VEHICLE AXLE.—Wyman C. Partlow, Oakland, Cal. Patented April 13, 1880. No. 226,454. This invention relates to certain improvements in the construction of wagon or carriage axles; and it consists in a novel construction and combination of parts whereby dust-proof caps are provided at each end of the spindle. The spindle which receives the wheel is made of iron somewhat smaller than the box within which it is to run. Upon this spindle two sleeves are shrunk, which extend toward the center of the spindle from each end, leaving space between them, so that the axle-box will turn upon and be supported by the sleeves, which is smaller and serves to retain a fibrous substance, which is saturated with oil or other lubricant. These sleeves are chilled or hardened so that the axle while having all the toughness of iron will also be provided with a perfectly hard surface for the purpose of the journal.

PHOTOGRAPHIC STAND AND ALBUM.—Lucien Dubernet, S. F. Patented April 13, 1880. No. 226,445. The object of this invention is to provide a novel photographic exhibition stand and album in which some of the photographs will be in sight at all times, by being on a revolving stand, and the others inclosed in a series of leaves, like those of an album, said leaves turning on peculiar metallic hinges, and having a sliding rest on which they lie when open. The frames encircling the pictures are fitted with peculiar springs, which keep them closed, but which admit of the ready placing or removal of the photographs. The revolving stand and revolving album combined make a very neat and handsome ornament for a drawing-room table, and the photographs contained in them are easily and readily examined.

THE total number of votes cast at the late election in Great Britain was 2,666,000, which is about two-thirds less than the total vote cast at the last Presidential election in this country.

In the Whole History of Medicine

No preparation has ever performed such marvelous cures, or maintained so wide a reputation, as AYRES' CHERRY PECTORAL, which is recognized as the world's remedy for all diseases of the throat and lungs. Its long continued series of wonderful cures in all climates has made it universally known as a safe and reliable agent to employ. Against ordinary colds, which are the forerunners of more serious disorders, it acts speedily and surely, always relieving suffering, and often saving life. The protection it affords, by its timely use in the throat and chest disorders of children, makes it an invaluable remedy to be kept always on hand in every house. No persou can afford to be without it, and those who have once used it never will. From their knowledge of its Composition and effects, physicians use the CHERRY PECTORAL extensively in their practice, and Clergymen recommend it. It is absolutely certain in its remedial effects, and will always cure where cures are possible.

FOR SALE BY ALL DEALERS.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruher's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

EXTRA COPIES can usually he had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Atlanta Mining Company.—Location of principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public anction; and unless payment is made before, will he sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, 420 Montgomery St., San Francisco, Cal.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, April 22th, 1880, and day of sale to Monday, May 24th, 1880. By order of the Board of Directors. A. F. McGREW, Sec'y.

Office—Room 7, No. 420 Montgomery Street, San Francisco, California.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 41), levied on the Eighth day of March, 1880, the several amounts set

And in accordance with law and an order of the Board of Directors made on the eighth day of March, 1880, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, room 8, No. 402 Front street, San Francisco, California, on Monday, the third day of May, 1880, at the hour of one o'clock P. M. of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale. W. O. WILSON, Secretary.

Office—No. 402 Front street, room 8, San Francisco California.

ANNUAL MEETING.

The Annual Meeting of the stockholders of the Original Gold Hill Gold & Silver Mining Company, for the election of a Board of Trustees to serve for the ensuing year and, also, for the transaction of such other business as may properly come before it, will be held on Monday, the Tenth (10th) day of May, 1880, at the hour of 2 P. M., at the office of the Company, Room 4, 309 California street, San Francisco, California. Transfer books closed on Friday, the Thirtieth (30th) day of April, 1880.

J. M. BUFFINGTON, Secretary.

Office, Room 4, 309 California, St., San Francisco, Cal.

ANNUAL MEETING.

San Francisco Copper Mining Company.

The Annual Meeting of the stockholders of the above named Company, for the election of Trustees to serve for the ensuing year, and the transaction of such other business as may come before the meeting, will be held on MONDAY, the third day of May, 1880, at the hour of three o'clock, P. M., at the office of the Company, 258 Market street (up stairs), San Francisco, Cal.

P. SANCHEZ,
Secretary.

ANNUAL MEETING.

NOTICE.—The Annual Meeting of the stockholders of the BRILLIANT MINING COMPANY, for the election of officers to serve for the ensuing year and for the transaction of such other business as may properly come before it, will be held on Wednesday, the 21st day of April, 1880, (third Wednesday in April), at 2 o'clock P. M., at the office of the Company, room 4, 309 California Street, San Francisco, California.

J. M. BUFFINGTON, Secretary.

Office—Room 4, No. 309 California Street, San Francisco, California.

DIVIDEND NOTICE.

OFFICE OF THE

Black Bear Quartz Mining Company,

Room 13, Safe Deposit Building, San Francisco,
April 16th, 1880.

A dividend (No. 72) of twenty-five (25) cents per share was declared on the capital stock of the Black Bear Quartz Mining Company, payable immediately.

WM. LETTS OLIVER,
Secretary.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company,

Nevada Block, Room No. 37, San Francisco, April 15, 1880. At a meeting of the Board of Directors of the above named Company, held this day, a Dividend (No. 54) of Fifty Cents (50c) per share was declared, payable on TUESDAY, April 20, 1880. Transfer books closed until 21st instant.

P. JACOBUS,
Ass't Secretary.

N. W. SPAULDING'S

PATENT DETACHABLE TOOTH SAWS,

Manufactory, 17 & 19 Fremont St., S. F.

L. P. DECEN.

MANUFACTURER OF

NO. 10 FREMONT ST., near Market, SAN FRANCISCO

ST. DAVID'S.

A FIRST-CLASS LODGING HOUSE.

CONTAINS 113 ROOMS.

715 Howard St., near Third, San Francisco.

This House is especially designed as a comfortable home for gentlemen and ladies visiting the city from the interior. No dark rooms. Gas and running water in each room. The floors are covered with body Brussels carpet, and all of the furniture is made of solid black walnut. Each bed has a spring mattress, with an additional hair top mattress, making them the most luxurious and healthy beds in the world. Ladies wishing to cook for themselves or families, are allowed the free use of a large public kitchen and dining room, with dishes. Servants wash the dishes and keep up a constant fire from 6 A. M. to 7 P. M. Hot and cold baths, a large parlor and reading room, containing a Grand Piano—all free to guests. Price single rooms per night, 50 cts.; per week, from $2.50 upwards.

R. HUGHES, Proprietor.

At Market Street Ferry, take Omnibus line of street cars to corner Third and Howard.

Notice! Important to Miners!

An important Machine called the

DRY GOLD SEPARATOR

Has been invented and can be seen at No. 5 Beale St., S. F. Arrangements have been made to manufacture in quantities to suit the demand. Machines weigh from 200 to 300 lbs. Price, $30 to $150. They run 10 to 20 tons of gold-bearing earth through per day, thoroughly separating the precious metals from the earth. Several are at work in Arizona and Mexico. A guarantee with each machine. Call and see sample at No. 5 Beale street, near Market, San Francisco.

RICHARD C. REMMEY,

PHILADELPHIA CHEMICAL STONE WARE

Manufactory,

1110 E. CUMBERLAND ST., PHILA.

Manufacturer of all kinds of Chemical Stone Ware for Manufacturing Chemists and others, such as Receivers, Acid Coolers, Mixing Pots, Stone Boxes, Worms, Elbow Pipes, Connecting Pipes, Sleeves, Pans, Dishes, Tin Crystal Jars with Lids, Still Heads, Ointment Pots, Jugs and Pitchers.

The Archer Patent Invalid Bed.

By simple mechanical attachments the Bed may be elevated, tilted, or adjusted to accommodate the invalid.

For full particulars see MINING AND SCIENTIFIC PRESS December 27th, 1879.

The adjustable bed bottom is put on top of the mattress, and by means of noiselessly operating cords and pulleys the patient may be put in any desired position.

The bed is adapted for persons in good health who wish an easy position, as well as it is for invalids.

This bed is of the latest improved form, with a view to simplicity, convenience and ease to the occupant.

A limited number of State and County Rights for sale.

Orders for the Patent Bed can be filled immediately.

Satisfaction will be given to those desiring to interest themselves in the manufacture or sale of this article.

JAMES H. ARCHER,

LEA AND PERRINS' SAUCE,

which are calculated to deceive the Public, Lea and Perrins have adopted A NEW LABEL, bearing their Signature thus,

Lea & Perrins

which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

Ask for LEA & PERRINS' Sauce, and see Name on Wrapper, Label, Bottle and Stopper. Wholesale and for Export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen throughout the World.

To be obtained of CROSS & CO., San Francisco.

Rotary Pulverizer,

(WHITE'S IMPROVED,)

For Disintegrating Ores and Other Substances.

GUARANTEED TO BE EQUAL IN CAPACITY TO A

HUNDRED STAMP BATTERY!

IS FITTED UP WITH

Homogeneous Steel Beater Bars.

Found to be more durable than either Hard Steel or Soft Iron. Dry-crushing the hardest rock; will last for months, and without the slightest danger of breakage.

The Pulverizer requires about one-third the power usually expended for the reduction of the same amount of Ore by Stamps.

Price List, Etc., of the White Rotary Pulverizer.

No.	Tons Per Hour.	Inches Diameter.	Revolutions Per Minute.	Horse Power Required.	Shipping Weight.	Lumber Required.	Price.
1	6	56	600	40	12	6,000 ft.	$5,000
2	10	72	470	60	15	9,000 "	8,000
3	16	84	400	75	20	12,000 "	10,000

The Repairs on the Pulverizer will not exceed those of a 10-Stamp Battery.

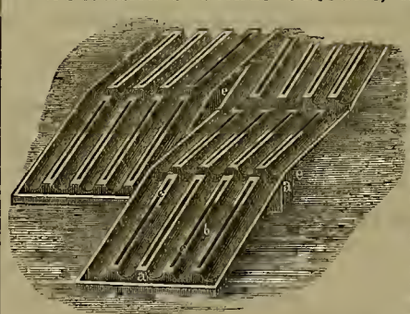
The Shipping Weight of the entire apparatus is not one-eighth of that of Stamp-Mortars required to do an equal amount of work. ☞It can be placed and put running at the Mill in from fifteen to twenty days.

Address GEO. W. WHITE, Inventor.

Manufactured exclusively at the ÆTNA IRON WORKS, 217 Fremont St.

San Francisco, Cal., January 1st, 1880.

Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, MAY 1, 1880.

VOLUME XL Number 18.

Copper Leaching.—No. 2.

[Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.]

Next in order are those ores which, while not admitting of concentration, nor yielding solutions readily without the aid of fire, are yet too poor to be treated by the more perfect, but also more expensive methods.

A good representative of this class of ore is found at Spenceville in Nevada county, where the San Francisco copper company has an enormous vein of almost pure "mundic," containing a small proportion of zincblende and copper pyrites.

This ore carries about 6% of copper, and being mined with great facility, can be worked with profit by a combination of the process already described, with more advanced methods.

It may be objected that this property has never yet made a dividend, but it must be considered that very extensive improvements have been carried out with little capital other than that obtained from the product of the mine, no assessment having been levied on the stock for several years past. Yet it must be admitted to be a subject of regret that so fine a property had not been from the first in the hands of parties having the enterprise and the ability to develop its vast resources in the best way.

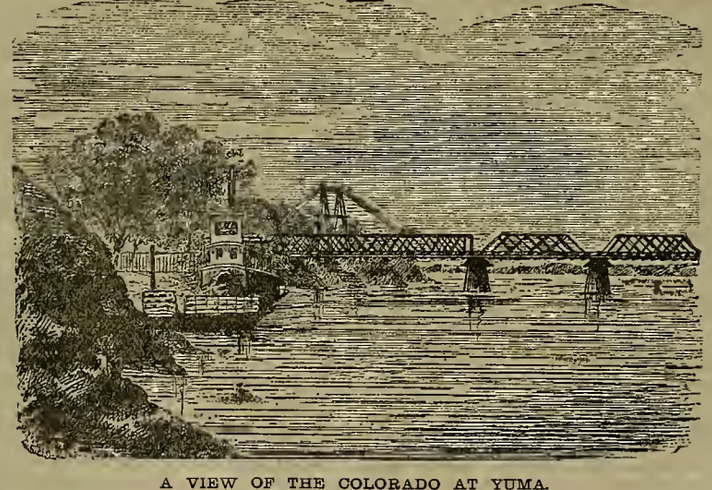
The ore when raised is transferred by a car and elevated tramway directly to the roasting sheds, of which there are several, each many hundred feet in length, where it is dumped in piles of about 100 tons each. In the middle of every pile is a cylindrical chimney, of bricks laid without mortar, and with open spaces between the ends, except a few courses at the upper part, where they are close together. Before the ore is laid down, a circular space around the chimney, about 30 feet in diameter, is covered with cordwood, from 1 to 2 cords being enough for 80 or 100 tons of ore. Upon the wood and around the chimney the ore, in lumps from the size of an egg to that of a man's double fist, or even larger, is thrown, till a mound is formed nearly to the top of the chimney, containing, as said, about 100 tons. This is then covered with fine ore, or with residues from the leaching, to the thickness of a foot or more. The wood at the bottom is fired through openings arranged while building the pile, and, once thoroughly ignited, the ore continues to burn without additional fuel, owing to the large quantity (about 50%) of sulphur in it; indeed, it requires to be very carefully watched, and kept well covered with fine material, to prevent its burning too fast, and producing so much heat as to form a matt, and so spoil the roasting. The fumes pass into the chimney by the interstices between the bricks, and escape into the air. The operation is, in fact, precisely like burning a pit of charcoal, except that instead of taking five or six weeks to complete it, it requires as many months.

When I say that 6,000 tons of ore, or some 60 piles are thus kept constantly burning, one-half being sulphur, it will be understood that the surrounding country does not suffer for want of the disinfecting virtues of sulphurous acid, and the disposal of this enormous volume of sulphur fume has become a subject for serious consideration by the company, as it is not only very injurious to human health, but also deadly to every kind of vegetation, so that the question unavoidably recurs, whether it would not, after all, have been better, as strongly urged by me, when I had the honor of superintending these works, long before they had attained their present magnitude, to have adopted a process which, though rather more expensive at first, would have consumed less ore, and made proportionally less stench, in producing the same quantity of copper, and probably have been more profitable in the long run.

The problem, however, now is what to do with the fumes, and it is one which may well engage the attention of other parties who may contemplate the establishment of works on a similar scale. To collect the smoke from all the burning piles into a single flue does not seem to be difficult, and in this alone there might be some advantage, since it could thus be readily conveyed to a distance, but that is scarcely enough. To absorb it by means of water, even if practicable, would only raise another difficulty in the disposal of the water, besides which it will not remain in water, but will be constantly escaping wherever the water flows. To make it into sulphuric acid would cost heavily for the plant, and as about 60 tons of strong acid, or a larger quantity if weak, would be produced daily, it seems doubtful if it could be given away, much more sold.

Theoretically it is possible to reconvert this smoke into sulphur, and as but little fuel is used in the piles to produce soot, which has been found troublesome in former experiments of this kind, there seems no reason why a good article of sulphur should not be made, and if it would only pay the cost of production, the indirect benefit would be very great.

The roasted ore from the piles is removed to the wooden vats where it is soaked in water or weak solution, which is heated and boiled for some time by a jet of steam. The *green* solution thus obtained, containing copper and iron sulphates, and free acid, is, after settling and dilution, transferred to large barrels mounted on rollers, and revolved slowly by steam power. Each barrel contains several tons of scrap iron, by which all the copper in the hot solution is thrown down in a few hours. The decoppered solution is allowed to go to waste, there being no market here for the large quantity of green vitriol which could be made from it. The precipitated copper is washed, dried and sold as cement copper, or melted into bars.



A VIEW OF THE COLORADO AT YUMA.

The ore from the boiling vats, which still retains nearly half the original quantity of copper, owing to the imperfect manner of roasting, is dumped in a vast pile on a sloping floor formed of sheets of felt dipped in melted asphalt and coal tar, and laid on the ground, and is continually leached by percolation of water or waste liquor, yielding its copper slowly but inexpensively, as the remaining sulphides are gradually decomposed by the action of air and moisture.

Why the revolving barrel is used for the precipitation in preference to a stationary vat, is not quite clear. When, some years ago, I took charge of these works for the purpose of testing the feasibility of leaching the ore, I found one of these barrels there, and understood its purpose to be, mainly, to exclude air during the precipitation, and so prevent the contamination of the copper by insoluble basic salts of iron, which form in large quantity when the solution, under certain conditions, is heated in an open vessel in contact with metallic iron. I found, however, that so long as this unfavorable state of the solution existed, the barrel gave no cleaner copper than an open vessel, and when, by adding acid, or by other means, the solution was so changed as to yield clean copper in the barrel, it did so equally in an open vat; nor does the operation in the vat require more time if the liquor is kept in gentle motion by means of a jet of steam. Moreover, the barrel is more expensive, both in construction and in operation, requiring as it does machinery and power to move it; and, to crown all, it is not free from danger, as is shown by the fact that several persons have been injured by it, myself among the number, owing to the evolution of hydrogen while working.

At the commencement of the leaching operation, by the present company, the roasted ore was leached with cold water, yielding a solution of a dark brown color, containing copper, iron and zinc, and yielding, in precipitation with iron, a copious gelatinous precipitate mixed with the copper. The addition of sulphuric acid turned the solution green, and gave clean copper; but this was found to be rather expensive and inconvenient. The sulphurous fumes from the roasting piles answered the same purpose, and some experiments were made with a view to a practical application, but the plan which was ultimately adopted as the most effective and convenient under the circumstances was that of boiling the solution for about an hour with the imperfectly roasted ore, by which a slightly increased yield of copper was obtained, and the solution became green, instead of brown, indicating a formation of free acid (vide Kerl's Metallurgy) and gave a clean copper.

If the brown solution got by cold leaching is boiled in contact with raw ore, it acquires a blue color, also giving clean copper on addition of a piece of iron. Simple leaching with hot water is not sufficient to give a good solution; actual boiling or long digestion with heat is necessary. An addition of salt was tried without marked benefit.

This is a very cheap way of working ore, and might probably be adopted with advantage in other localities, though, where the ore is a little richer, or of a different character, especially where silver is also present in paying quantity, the Hunt & Douglas process, which will form the subject of my next paper, would be preferable.

GLADSTONE has been chosen Premier of England, and the remainder of the British Ministry will be as follows: Earl Granville, Secretary of State for the Foreign Department; the Marquis of Hartington, Secretary of State for India; H. C. E. Childers, Secretary of State for War; Lord Sehorne, Lord High Chancellor; Wm. E. Forster, Chief Secretary for Ireland; Lord Northbrook, First Lord of the Admiralty; Sir Charles Dilke and Chamberlin have received offers of Under Secretaryships. Chamberlin declines and Sir Charles has not yet accepted.

THE following appointments have been confirmed by the U. S. Senate: William A. Newell, of New Jersey, Governor of Washington Territory; E. J. Smithers, of Delaware, Consul at Chin-Kiang; E. M. Marble, of Michigan, Commissioner of Patents; William H. Berry, agent at Los Pinos; J. C. Tiffany, agent at San Carlos.

Mining Dividends are not Always Judicious.

While it is undoubtedly gratifying to the holders of mining shares to receive dividends early in the working of a mine, the question arises if it is not injudicious to make them until the mine is fully opened and its ability to sustain its operations by its own product is established beyond cavil. There will frequently arise in the development of a mine occasions where the outlay of a considerable excess over general average expenditure will be absolutely necessary to maintain its future prosperity. Dead work will have to be carried forward through barren and unproductive portions of the vein. Shafts will have to be sunk through rock that will not yield ore, and a numerous catalogue of such contingencies might be given, each one of which would be fatal to the existence of the mine if it should not be overcome. The main shaft should be two or more levels deep beyond the level on which the ore is being extracted. Those levels should be run in advance of the requirements of the mill for ore, and also to enable a fair average quality of ore to be sent to mill at all times. The richness of a vein is rarely, if ever, uniform throughout its entire extent. By having these levels opened ahead of the work, good ore can be taken out of them to mix with the lower grade in the upper levels. To accomplish the sinking of the shaft and running the levels mentioned, entails a large outlay of money. If the first profits of the mine have been paid out in dividends, there will be no funds on hand to carry ont this work. Assessments will have to be laid, or a suspension of the work ensue. If the stockholders were certain of future dividends, and knew that the profits of the earlier work were being held in safe reserve to meet any emergency that might arise, or were being expended in more complete opening of the mine, they certainly would not find fault at such judicious management. They would know that such a system would ensure more ample dividends when such expenditure had accomplished its work. They would see that it would be folly to exhaust the treasury while a prospect, or a probability, of needed outlay might become a reality. The payment of dividends from the first proceeds of the mine may result in seriously crippling it. It would hold out false representations of its ability, and would give rise to suspicions of failing productiveness, if not continuous at all times. The mine that takes the more sensible plan of using its means for wider development, is the one that will be the most permanent, and will meet with the highest approbation from its stockholders.

The Railroad Bridge at Yuma.

We give on this page an illustration from Conklin's "Picturesque Arizona," showing the railroad bridge over the Colorado river, at Yuma. This bridge conveys the passenger from California into Arizona and is an assurance to him that the "frontier" is vanishing before the advance of enterprise and industry.

An interesting incident is related in connection with the completion of this bridge. From a misunderstanding between the civil and military authorities, orders were carried to the military headquarters at Fort Yuma, not to allow any of the Southern Pacific rolling stock whatever to cross the Colorado, and to stop the construction of the bridge. A sentinel was placed at the bridge to keep watch. Deceived by the quietude of the railroad party, he went to sleep. The railroad men stole a march on the "army," and in three or four hours the last quarter of a mile of track was laid, including a section of the bridge. The right of way to the company for crossing the Colorado ended on the following day, Sept. 30th; but on the 29th, at 11 o'clock at night, they ran the first steam cars over this bridge from California into Arizona. Since then the road has been extended some 30 miles or more beyond Tucson, and has brought Arizona into prominence and prosperity many years before such a thing could have happened without a railroad.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Letter from Amador County.

EDITORS PRESS:—On sither hand of this little hamlet lie some of the historic mines of California. Along ths ten-mile stretch of the mother lods, rsaching from Jackson to Plymouth, are situate as many voted properties as can he fouud within any like space slsewhere iu the State. Hsre, half a mile north of Jackson, is ths Oneida, a vsteran gold producer, runuing its 40-stamp mill right along, as it has done with but little interruptiou for many ysars. Next, a little furthsr on, near the town of Sutter Creek, is the famous old Hayward mine, uow the Eureka, wbich iu its day has enriched a good many men, and will probably enrich a good many more. Ths company is now putting down a new shaft to supply the place of that hurned out and filled with water some time ago. This new shaft will opeu up a great extent of fresh and valuable grouud, and give a new lease of life to the mine. Meantime the company's 40-stamp mill remains unemployed. A little furthcr this way brings us to the Lincoln mine and 40-stamp mill, hoth in active and successful operatiou. Journeying on a mile and a half hrings us to the Keystone, to which the same remark may be applied as to the Lincoln—a hig mine and a 40-stamp mill turning out hullion at the average rate of abont $55,000 per month. Next, qnartsr of a mile north of Amador City, is the original Amador mins, witb 40-stamp mill, which ie not just now running, though new and promising ore developments are iu progress. The 10-stamp mill of the Bunker Hill company, a little this side, is doing steady and good work, and their mine is looking well. Between this point and Drytown, two miles further north, we bave, first, the Gover, running 10 of their 20 stamps, the ledge having contracted, reducing the ors supply temporarily; then the Pennsylvania, where also ore extraction is suffering au interregnum pending fresh developments likely soon to he made; and the Seaton, operating with fair results.

Passing Drytown, we reach ths old Potosi, now the Califoruia, a right sterling property, with a 10-stamp mill, nearly new, which, it is said, will soon he started up. This mill should not have been idle so long, as in fact it would not have been but for the mishaps that from time to time have befallen the owners, nonc of whom appear to be men of largs means. As very little money would put this mine in good condition for hullion production, enough to suffice for that purpose ought to he forthcoming from some quarter, since with such aid large and long continued profits would he sure to attend its active working. Thsre is not on the mother lode a mine that can show so much good ore in sight as this. At Plymonth, the Empire mine, tbe next important property to the California, is yielding enough ore to keep the company's 80-stamp mill busy day and night, a condition of things that will probahly hold here for a long time, the ore reserves in this mins being large.

Tbe course of tbe mother lode in tbis vicinity is ahout north northwest, and, while this vein carries the heavisst hodies of ore, ssveral of thoss running parallsl with and lying a short distance to the east of it also coutain large ore deposits, those on the Gold Mountain claim heing fully 40 fest thick. The ownsrs of this propsrty will soon start up thsir mill, the furnace for roasting the ore beiug now ahout completed. It is expscted that a handsome production of bullion will he made here, as the ore is ahundant and of good grade, though somewhat intractahle. The furnace here is built of soapstone found in large quantity about one mile from the mine. This stuff, which is sawed out in blocks of just the right size and shape for constructing the furnace, has been tssted and found to stand a higb beat hetter than English fire brick.

The main shaft of the Zsile mine, near this place, is hsing sunk another hundred feet. Tbe company's large new mill is ruuning hut 25 of its stamps, owing to insufficiency of water, a trouble that will soon be remedied, arrangements having heen made with the ownsrs of the Moore ditch for a full and steady supply. Good ore is bsing raised from tbe Yellow Jacket mine, a tsst crushing of which is about to be uade at the Bonanza mill. Some of this ore is as rich in gold as any ever found in this vicinity, and the entire mass coming from the mine will yield at least $20 psr ton under the stamps. The Yellow Jackst nine is situated on the Crown Point lode, one of a scries of three small quartz vsins that intsrsect the mother lode near this place, coming in from the soutbwest.

After a long intermission, the hydraulic mines in this neigbborbood are all at work and, witb the prospect of good weather and a full water supply, are likely to turn out this season very nearly their usual complemsnt of gold dnst, wbile the otber hranches of placer mines will do hetter this year than usual. J. S.

Drytown, Cal., April 21, 1880.

THE Senate has confirmsd the appointment of Edgar M. Marble, of Michigan, as Commissioner of Patents, to take effect May 1st.

Mining Kings in Utah.

The veteran and succssful miniug meu of this country are mainly to hs fouud on ths Pacific coast, and nine-tenths of thsm within the States of California and Nsvada. Among them are numhersd eome of ths richest men in this natiou, but their's is not inheritsd wealth. It is largely the rssult of hard, persistsnt work in a lins of industry that ahounds with examples of sudden outcomes of profits, as nature's hoarded trsasures are unearthed hy the patient, hard-working minsr.

A comhination of adverss circumstancss such as communistic and hostile legislation in California, a falling-off in the outcome of the Comstock bonanzas, witb incidental drawbacks unnecsssary to mention, taken in connsction with the great mining sxcitsmeut in Colorado, have induced some of thsss mining kings to figure on Wall street and on the eastern slops of the Rocky mountains. Ths New York press has been juhilant over the eastern flight of thess occidsntal chiefs, on the presumptiou that the seat of mining empire was ahout to be removed from ths Golden Gate to the neighborhood of Hell Gate on the East river.

But in the future, as in ths past, the mining centere of this continent, ars to he on ths western slops of the Rocky mountains. The largs preponderance of mineral areas, the great bonanzas of the world, the deep and permanent veins of precious metals lie hstween the Rockies and the Pacific. The mining magnates of this coast are aware of these facts and they propose to abide and profit by them. Better than any other class of men, they know how to open and develop these great mines. No picayunish managemsnt characterizes their opsrations. They are the men we want here in Utah, and we are glad to know that their trusty agents and expsrts have been and are spying out and getting hold of Utah mines. The Ontario is under the management of coast men, as wsll as otbsr mines of less nots iu the Tsrritory. From this time on, men and capital from California and Nsvada will flow into Utah. The immense amount of work expendsd on our mines the last four or five years, exposing true fissure veins and large deposits of lead, silver and gold orss, in connection with the low prices of mining property and the absence of speculative inflation in all dspartments of business, make tbis Territory tbe hest and most inviting field for mining investment of auy on this continent. Eventually the timid men of the East will venture across the mountains and invest their capital in the great coal and iron fields—the porcelain clays, marble qnarries and sulphur dsposits of this magnificent Territory. But the money kings of the Pacific coast have the nsrve and the wealth needed to at once occnpy and develop the gold and silver fields of Zion, and to them we rightfully look as the future millionaires of Utah.—*Salt Lake Tribune.*

Bald Mountain Gravel Mines.

In the tunnel of the Bald Mountain extension company at Forest City last month, 100 feet of tunnel was run in the brief period of 21 days, through cemsnt or mountain lava. Holes are drilled in the face of the tunnel from 3½ to 4 feet in deptb, every blast throwing out about 2 fest of rock. Ten ponnds of giant powder ars nsed for eacb day and night shift of 24 hours. No timbers are required, and on completion, sbould the lava formation continue, this air-line tunnel will never need repairing, and bs a permanent "open sesame" to the insxhanstible treasure vanlts of Bald Mountain. The dimensions are 6½ fest high hy 5½ in width. Fifteen carloads of csment are run out every 24 hours, which, considering the present length of the tunnsl (over 1,700 fest), and also that only band-power is employed, is a very creditable amount of work for four men in tbs short time allowed. The water in the air-shaft has a fall of 64 feet, thoroughly veutilating the tunnel. The supposition now is that possibly undersath the strata of lava there may be a rich gravel hed conrsing through the South Fork to the Bald Mountain extsnsion ground.

In the history of gravel mining on this coast, or perhaps the development of the broad, rich and extensive mineral belts in the most noted gold-bearing countries on the globe, it would he very difficult to discover a gold mine that has in a few years yielded such princely dividends on an insignificant investment as the now famous Bald Mountain of Forest City. On an outlay of $25,000, cost of sinking a shaft, running a tnnnsl and the purchase of a water right, since the claim was first opened in 1871, an income of over $800,000 has heen realized witb aggregate receipts at fully $1,500,000. Since the advent of water season, last Decemher, the sum of $40,000 has been divided among the stockholdsrs. The Decemher was the best monthly yield, amounting to $23,200. One hundred and twsnty men are now employed. All except a few, the bosses and those who work in wet and dangerous places, are paid three dollars a day, making the lahor expense alone foot up to near $10,000 a month, which, inclusive of the conntless incidentals, amount to quite a round sum for a single gravsl mine to circulate in a mining camp where the houses could almost be had for the asking before the gold vaults of Bald Mountain were nnharred. As the channel is over six hundred feet wide, this rich ancient river hsd promises to yield tbe same large dividends for an indefinite period, and course through tbe entire ridge to the Savage, Sierra City aud Gold Lake.—*Downieville Messenger.*

Ho! for the Gunnison.

Should nine-tsnths of tbe men and womsn now in Lsadville who say they ars going to ths Gunnison this spring kesp their word, thsre will not hs psople enough left to operate the mines in ths Leadvills district now opensd. Ons can scarcely find a miner, a prospector, a provision dealer, a grain msrchant, a gamhler, a saloon keepsr, a dance-house "rustler," a cigar merchant, a news gatherer, a showist, a muls kicksr, a wood vender or a printer who ars not prsparing to leavs for the Gunnison as soon as they can settle up and procure ths necessary outfit. And thsy ars now starting. Probably no less than 200 msn lsft this camp ths other day. Ons squad of adventurers numhering 30 men "chipped in," honght a span of mules, a harness and a wagon, and with their guns and rnhher hoots set forth. As they marchad down Chesnut strest thsy wers noticed. In answer to the inquiry as to bow they sxpected to get thsir mules and wagon over ths range, the captain of ths outfit said that thsy would carry tbsm over on snow-shoes if no othsr inlet to the Gunnison country could he found. Thsy wsrs headsd for some distant southern pass, thsy did not know exactly whsre. All they eeemed to know or care ahout was that thsy were going to the Gunnison, and from their determined attitnds one was impressed with the conviction that what thsy bad undsrtaksn would be accomplished.

Those heavily loaded with Leadville city lots may not like to have these facts go ahroad, hut thess are facts, neverthelsss. It was about the same last spring. During the months of April and May one year ago a large portion of thoss who had wintered in Lsadville went to the Gunnison country, but they were prstty much all back in the city by the 1st of September. During the hight of ths outgoing stampede, city propsrty went down to notbing. Lots that are now hsld from $500 to $2,000 could bave heen purchased at the buyer's offer, no matter if the offer had been none other than a yellow dog. A decent-sizsd jack would have taken the bsst rsidence lot in the city. Fortune hunters, according to Gov. Talhot, are a good deal like merino sheep—whsn one scoots they all follow, and each one in the herd go it blind. Not one in a thousand now scooting for the Gunnison have any idea where they ars going. Somebody says that a prospect hole somewhere has besn bonded for 60 days for $50,000 and 10,000 msn rnsh to look at the imaginary hole. But it's fnn.—*Central City Register.*

Surface Ores.

John Steele, says the Virginia *Enterprise*, has contracted with the Sisrra Nevada company for the privilege of taking out ors from the old croppings on Cedar hill. In tbe sarly days a large amount of free gold was taken out of the dehris accumulated on the southern slope and foot of Cedar hill by hydraulic process. Mingled with this dirt was a great amount of quartz rich in gold, much of which showed free gold on tbe surface and occasional pieoes of which were heautiful specimens, being almost covered witb bright spanglss of gold.

The ledge or deposit whence all tbis gold and tbese valuahle quartz specimens came has never been found. The dirt that was worked by hydraulic process lay in strata, showing that it had been subjected to and depositsd hy the action of the water. No douht ths channel of Cedar ravine (at pressnt much lower) was at one time along the side of Cedar hill, where this hed of rich dirt was fonnd. Somewhere above where the pay gravel was found the water of the ravine must have ent through ths top of a vein of very rich qnartz, but tbe exact spot has never been found. Although drifts have hsre and there been run into the deposit of placer dirt, the courss of the old channel has never heen followed through those parts where it cut into and impinged upon the bedrock forming the face of tbe hill. One of these days soms person working in this surface dirt and in the croppings along down the side of the hill will make a tremendous find, and we hope that John Steele may be the lucky man. No man on the Comstock is bstter acquainted with Cedar hill than he. Almost ever sinca he has been in the town he has had more or less to do with surface workings on said hill, and has at various times taken out largs amounts of money. The whole hill is so rich iu gold that could water hs obtained, as in many places in California, it would pay to sluice down everything sluiceahle found upon its surface.

HEAVY MINING SALE.—Says the *Times-Review:* The mines in Centsnnial district, 19 in number, have, we are reliahly informed, at lengtb heen sold, and the purchase money, $1,000,000, deposited. Thess mines embrace some of the best propertiss in the northern end of the county. Many of them have heen prospected for two or three years, and from the accounts we have received of them, it is safe to say that Centennial will, in the near future, prove to he one of the best bullion producing districts north of the railroad. The new company—organized in Chicago—sxpect to commence work about the 1st of June. A number of Tuscarora prospectors will be benefited by this sale, having spent their all in developing claims, which further work will doubtless prove to be good mines. Messrs. A. D. Meacham and S. B. Morrey who made the eale, are still in tbe East, hut are expected here by the time tho company is ready to commence operations.

Antelope District.

Mr. Wm. Whalsn, of Antslops district, favored ths *Sentinel* with a call yestsrday; likswise, with some rich spscimsns from his mins. Mr. Whalsn is sanguins that Antelops will havs a hoom this season. Hs says ths mines are thers to warrant it, and the camp cannot bs kept down when ths public becomes apprised of its grsat merit. Ths ledges ars hold and well-definsd, and the ors of a paying grade. Devslopments on ths mins of W. Strandberg & Co., hetter known as ths Italian claim, are furthsr advanced than on any other mins in the district. On this mins a winze has hsen sunk in the ledge to a depth of 196 feet. Ths lsdgs at tbis point has an averags width of 25 fsst. Ths ore occurs in chambsrs or bonanzas, ths sams as in the mines at Ruby Hill. They have 100 tons of ore on ths dump, averaging $83.75 per ton in silver, and carrying 60% of lead. This is certainly a most flattsring showing. The mine is looking especially well at ths bottom. Msssrs. Strandherg & Co. will commence shipping ors to the Eureka furnaces in a few weeks, and will make rsgular shipments thersafter.

Mr. Whaleu is sngaged in devsloping his Sierra Nsvada mins. This is a mammoth vein, heing 200 feet from wall to wall. It has a magnificent outcrop, and is easily traceahls its entire lsngth of 1,500 fest. Ths ore assays, near the surface, from $100 to $120 to the ton. The new shaft is down 45 feet, sbowing ore to the bottom. Considerahle ore has accumulated on the dump, which will bs shipped to Eureka for treatment, next month. On the whole, Mr. Whalen is in bigh spirits ovsr the prospects of Antelope, and he is sanguine that ths district will send up large shipmsnts of custom ors until they can get a furnacs of their own.

A number of prospectors have lately sntersd the camp with the view of acquiring and developing mines. It seems prohahle that Antelope will become an important point before the summsr is over.—*Eureka Sentinel.*

Grass Valley Mines.

Quartz mining in the Grass Valley district has hesn greatly interfered with in the last few monthe, by the unexampled severity of the winter, which has prevented prospecting and rctarded the operations of quartz and wood hauling, therehy placing an embargo on such companies as had not provided against the contingencies of bad roads and deep snows. The old established mines continned work without interruption. Witb ths advent of spring, and a promiss of settled weather, preparations ars heing made for a general resumption of work, and the outlook is considered favorahle for a season of activity in this character of mining in this vicinity. There will be increased work in some of the old mines, and there will bs sveral now ventures, or rather a revival of claims formerly worked. Among these will he the Sebastopol, a mins of excellent promiss, which has bsen standing idle sincs 1858. The Idaho mine, which during its life has yisided hetween five and six millions of dollars, continues to pay rsgular monthly dividends, and has shown an improvement in the lower levels of late, which give good rsasons for believing that tbe dividends will not only continue but increass in amount. The developments made in the New York Hill mins, during the past year, have bssn important, and its return to dividsnds is an indication that it is becoming a really valuahle mine. Negotiations are taking placc looking to the opsning of several mines, but they are not sufficiently advanced to speak of thom definitely.—*Grass Valley Union.*

MILL CREEK.—Messrs. H. F. Band and Dr. Roe just returned from Mill Creek, whsre thsy have been for the past few days, arranging for working the mines owned by the Homer Land, Mill, Water and Mining Co. Provisions and tools have been forwarded, and men placed at work rnnning a tunnel, grading roads and sinking a shaft. They report the prospects of thsir company as being favorable, and that of ths camp as bsing the biggest booming mining camp in Mono county. The roads are good, excspt through Cottonwood canyon, where the snow still obstructs travsl. A few days' warm weather will soon clear it out and make the best and most available road to Lundy. Ths doctor thinks those going to Mill Creek will save four miiss of travel by turning off from the etage road at Martin's station and taking Martin's cut-off. Accommodations at Mill Cresk are meager. George Marks has fitted up a lodging house supplied with spring beds—a luxnry nnknown in any other house in town.—*Bodie Free Press.*

AN old maxim reads, "alwaye look for a dollar whsre you lost it," and its application may become of use to those who are making foolish investments in mining property, as many are doing now, especially in the newer mining districts, whsre reduction works are of limited capacity and all expenses high. Undonhtedly many will find to their sorrow that they cannot work their new propsrties and make both snds meet; and the foolish ones will throw away the experience they have pnrchassd so dearly, but tbe wise ones will profit by it and in the end reap a fortune. It is the road that all snccessful miners have had to travel, and new comsrs must not calculats npon bsing exceptions.—*Georgetown Courier.*

MECHANICAL PROGRESS.

Temperature of Steam at Different Pressures.

Steam is much used for both heating and boiling purposes, especially where a uniform and known degree of heat is required, as in the manufacture of celluloid, etc. By increasing the pressure, the temperature is increased; by diminishing the pressure, the boiling point is lowered—that is, the temperature of the steam (or vapor) is reduced below 212°; thus, at a pressure of about ½ an atmosphere, or 7.35 pounds, the boiling point of water is lowered to 180°, and in vacuo it boils at 125°, or even lower. Both these principles are utilized in the arts; the high temperature of steam under pressure, for example, in the extraction of gelatine from bones, the vulcanization of rubber, conversion of celluloid, etc.; while the opposite process is constantly made use of in the arts to concentrate vegetable extracts, to distill volatile principles, essences, etc., under diminished pressure (or in vacuo), and consequently at a temperature below that at which they would suffer destruction by heating, or contamination from other substances from which they are to be separated.

The following table gives at a glance the temperature of steam at different steam pressures:

Steam Pressure.	Temperature of Steam. Regnault.	Nystrom.
14.7 pounds	212° Fah.	212° Fah.
25 "	240 07 "	241 "
50 "	280.89 "	282.8 "
75 "	307.42 "	309.8 "
100 "	327.6 "	329.9 "
150 "	358.4 "	360 "
200 "	381.8 "	382.6 "
300 "	417.7 "	416.5 "
400 "	445 1 "	441.9 "

PLUMBAGO AS A LUBRICATOR.—The *Engineer* gives the following example of the value of black lead as a lubricator: "A fly wheel shaft bearing, eight inches in diameter and ten inches long, carried a load of nearly 10 tons. The bearing was supported on a box girder, and was lined with good brass. The engine could not be run, as this bearing inevitably got red hot after a few revolutions; various oils, tallow, sulphur and gunpowder were tried with most indifferent success. By using a mixture of tallow and sulphur the engine could be run half an hour at a time, and once or twice has run a whole day, the shaft making sixty revolutions per minute. It was determined to have a new crank shaft with longer bearing, but as at the last moment the use of black lead and tallow was suggested, a package of this ordinary black lead used for stoves was worked up with some tallow, the bearing carefully wiped, and the grease box on the cap filled with the mixture. The bearing never heated again unless oil was allowed to get access to it. The success of the plumbago as a lubricator was perfect. It should be added to the foregoing that while the principle of lubricating by graphite, or plumbago, is scientifically correct, and has in thousands of instances been practically illustrated, it has been damaged seriously by use of impure graphites. For perfect success the graphite should be absolutely clean."

ALLOYS OF IRON AND ZINC.—The alloying of iron and zinc is a very difficult process. The trouble seems to arise from the fact that, at the temperature at which iron melts, zinc is rapidly volatilized; and, if the zinc is added to a mass of molten iron, it decrepitates and soon disappears by volatilization, so perfectly that, after a short time, not a trace of it will be found in the metal. But, by taking the special precaution of introducing the zinc beneath the surface of a bath of melted iron, through a well-heated iron tube, alloys of these metals have been formed; but they have only a scientific interest, and are of no account in the arts. When iron is left for some time in contact with molten zinc—as in the process of galvanizing—a portion of the iron is dissolved, and forms an alloy of zinc and iron, which appears to have a definite constitution—21 zinc to 1 iron. If the iron is left long enough in the zinc, it will entirely disappear. The alloy appears to be of little use, as it is coarse-grained and brittle. The only practical use to which it has been put, we believe, is, as an impure zinc, in the refining of base bullion, for which commercial zinc has hitherto been employed. The alloy appears to be very well adapted for such a purpose, and has the advantage of cheapness.

HEIGHT OF FACTORY BUILDINGS.—Continued attention is being called to the non-economic and dangerous practice of erecting high buildings for factory purposes, of which full mention was made in these columns in our issue of April 3d. It is now thought that ere long the cotton mills of New England will be built with one story, instead of with five or six, as at present. The advantages claimed are increased safety and convenience, and a higher speed for machinery. The report of a New England gingham factory on last winter's use of a one-story building, was that it covered about an acre, was built of brick with corner towers, at a cost of $23,000, and saved in gas alone a sum equal to the interest on the cost of the building. The looms were driven at 12% higher speed than on the second floor of the old mill, the repairs were fewer, and less imperfect work was turned out.

Smelting Iron with Oil.

Some elaborate experiments have recently been made at the Fanny Furnace, in West Middlesex, Penn., under the direction of Prof. Robertson. What is considered a final and successful test is described by an eye-witness as follows:

The furnace was not in what would be called first-rate condition; the gas was bad, and a few other minor matters interfered with the arrangements, and, taking it altogether, it was in bad condition for experiments. The feeding apparatus is simple in construction. The main tank contains about four and one-half barrels of crude oil, which is pumped in by a hand-pump at present. It stands about a hundred yards from the furnace stack, and the oil is conveyed to the tuyeres by an inch gas pipe, where, by a series of valves and pipes, it becomes incorporated with superheated steam before entering the crucible. It passes into the tuyeres through the gate of the blowpipe, about an inch above the plug hole, and has a capacity of from ten to one hundred gallons of liquid an hour to each tuyere. * * * Looking through the glass in the gate we saw a beautiful volume of white flame, having all the appearance of a pure hydro-carbon. The flame moved with a very rapid motion, a motion that would seem to melt anything with which it came in contact. The volume ignited almost immediately after striking the blast in the blowpipe. The two volumes, one of superheated steam and the other of oil, becoming one volume, and that volume burning, proves to any one having the least knowledge of chemistry that the burning volume is a pure bicarburet of hydrogen, which proves beyond a doubt that no water is transmitted into the crucible of the furnace by the oil. That crude petroleum is a disphosphorizer is admitted by all, and that the oil improved the gases of the furnace is another admitted fact, and we see no reason why the discovery of Mr. Robertson should not be utilized by all blast-furnace owners in this valley.

TO COMPUTE HORSE-POWER.—First find the average pressure on each square inch of the piston; multiply this by the number of square inches in the piston, and by the number of feet traveled by the piston per minute, then divide this product by 33,000. The quotient will represent the number of horse-power at which the piston is working. This rule is simple enough to apply, but the difficulty is how to find the average pressure. An indicator applied to each end of the cylinder while working would give a card from which the average pressure may easily be obtained. Without an indicator, the average pressure may be found by the following rule: Let L = stroke of piston in inches; l = piston travel in inches to cut-off; $R = \text{ratio} = \frac{L}{l}$; H = hyperbolic log of R; P = initial pressure of steam in pounds per square inch; p = mean or average pressure in pounds per square inch.

$$\text{Thus } p = P\frac{1+H}{R}$$

But this calculation involves the factor of the initial pressure—that is, the pressure that starts the piston, and this must be ascertained by some means. A sensitive spring gauge applied to the cylinder while working might show it near enough for ordinary purposes; and the point of cut-off can be obtained by measurement while the engine is slowly turned, observing the valve's and piston's motion—having removed the steam-chest cover for that purpose—and turning the engine around by hand.—*Manufacturer and Builder.*

DESCRIBING LINES ON BRIGHT SURFACES.—Many workmen find it somewhat difficult to describe the pattern of work upon iron or steel, especially after the surface is finished. Yet it is necessary to have an outline of the intended form. For instance, if the pattern of a hammer for a revolver be required to be made on a piece of iron or steel that has been faced down, the general practice would be to drill the hole for the screw or pin on which it turns, then fasten the pattern to the work by driving a piece of wire in the hole, and with a scriber mark around the pattern, which is then removed and the work filed away to this line. To obtain a more permanent line and one that will show very distinctly in all its tracings, coat the surface on which the line is to be made with a film of copper. To do this take a lump of sulphate of copper, sometimes called bluestone, wet it with water and rub over the bright surface of the work. The moisture will dry in a few minutes, when the pattern may be put in place and the outline described. The line will be clear and show very distinctly through the copper surface. Three or four light rubs with the sulphate are sufficient to produce this surface, which is so very thin that it may be easily removed, when the work is done, with a fine file, or by rubbing with a bit of emery cloth.—*Blacksmith and Wheelwright.*

RULES FOR FINDING THE HEATING SURFACE OF VERTICAL TUBULAR BOILERS.—Multiply the circumference of the fire-box in inches by its height above the grate in inches; multiply the combined circumference of all the tubes in inches by their length in inches, and to the sum of these two products add the area of the lower tube or crown sheet. Divide by 144, and from the quotient subtract the combined area of all the tubes, and the fire door. The remainder will be the number of square feet of heating surface.

SCIENTIFIC PROGRESS.

Improvement in the Construction of Steam Injectors.

Some substantial advances in the construction of steam injectors are reported to have been made by Mr. J. H. Irwin, who has announced certain rules and formulæ for the proportions of the parts of this useful apparatus, and who has embodied the same in an apparatus which has lately been demonstrated by the tests of a committee of the Franklin Institute to be capable of yielding results of a very superior character. The last trials of this apparatus were of the most thorough and exhaustive character, and furnish in themselves a model for future work of a similar nature. The results announced by the committee are that the information gained in regard to this injector is highly important in the cause of science, and that Mr. Irwin has contributed a valuable improvement in the manner of constructing injectors, increasing their power of augmentation to above twice that of the pressure of steam and for practical working without waste, and to about four times with waste at the overflow, and apparently demonstrating the general law "that the lower the steam employed the higher can the proportional augmentation of pressure be carried."

The remarkable thing about this apparatus—and that which gives an air of strong probability to the claim of Mr. Irwin that he has discovered a law of universal applicability relative to the proportions of the parts of the injector—is the fact that the apparatus, as shown by the committee's test, adapts itself to a great variety of conditions. Thus, the experiments ranged from 105 pounds pressure to 15 inches vacuum, the instrument still working; an augmented pressure of 330 pounds was gained with 90 pounds of steam, and at 10 inches of vacuum an augmented pressure of 10 pounds was gained; feed at 122° Fahr. was lifted 19 inches, and forced by 30 pounds of steam against an equal pressure; water was lifted 21 feet by 40 pounds steam, and forced against 60 pounds; and many other tests were made with "the same instrument without a particle of change or alteration."

The law governing the economical action of injectors, as enumerated by Mr. Irwin requires the employment of certain angles and set dimensions of the interior working parts, of which the following are the most important:

Taking the lesser diameter of the combining cone as the standard of measurement of the instrument, and calling it 1, the larger diameter and length of combining cone will be 4, the diameter and length of jet opening in steam cone will be 2, the smaller diameter of receiving cone will be 1, its larger diameter 2, its length 16, and the diameter of the starting steam jet 0.5. The water supply pipe and overflow are set at an angle of 45° to the axis of the instrument, which is claimed to materially increase its power of augmentation.

We cannot do more here than simply present the general features of Mr. Irwin's important invention, and the general tenor of the committee's report. For details in full, we refer our readers to the *Journal of the Franklin Institute.*

USEFUL APPLICATION OF THE TELEPHONE.—The telephone has been found by Herr Niemoller capable of determining very quickly and accurately the resistance of liquids. It is substituted for the galvanometer in a galvanic bridge, and an induction current is used; then, if the resistances compared are a large liquid resistance on the one hand, and a Siemens resistance box on the other, so that the electrodynamic constants of the branches are very small; if, further, a German silver or platinum wire be used as measuring wire, it is found that in the position where the galvanometer shows no deflection, the tone in the telephone has a well-marked minimum of intensity. Supposing the liquid resistance has 2,000 units, a variation of even four units reveals itself in a displacement of the minimum position. A connection was made, a few weeks since by telephone between Plymouth church (Beecher's), Brooklyn, and the towns of Orange, Newark and Elizabeth in New Jersey, also several points in New York city, at each and all of which Beecher's sermon and the music were both heard. The transmitter was placed in front and below the pulpit. The furthest point was 17 miles distant.

AN ingenious method of measuring the quantity of moisture in the air has been devised by Herr Rudorff, who lately announced it to the German Chemical Society. It consists in admitting to a measured volume of air, contained in a suitable glass chamber, a small quantity of sulphuric acid from a graduated tube with stop-cock. The acid absorbs all the aqueous vapor contained in the air, thereby reducing the pressure in the chamber. This diminution of pressure is shown by means of a manometer connected with the vessel. Sulphuric acid is then admitted in drops until the original pressure is restored. The absorbed aqueous vapor is thus replaced by an equal volume of sulphuric acid, and by calculation the percentage of vapor that the air had carried can be readily ascertained. The method is said to give very accurate results, and the operation makes a good lecture experiment.

Cupellation Shown with the Lantern.

A lantern for the oxyhydrogen light has been devised by Mr. D. S. Holman, of the Franklin Institute, which possesses a number of advantageous features. According to the description given of this convenient adjunct of the lecture-room, it may be converted into a vertical lantern for showing precipitations, the action of a magnet on iron filings, and kindred experiments, and with equal facility may be changed into a projecting microscope, or into a megascope, for showing solid objects on the screen greatly enlarged. In the course of some lectures lately delivered before the Institute, by Mr. A. E. Outerbridge, Jr., of the U. S. Mint, on the subject of "Coins and Coinage," the highly interesting and novel experiment was performed of showing to a large audience, by means of the convenient apparatus just named, the cupellation of gold and silver, as performed in the assaying of the precious metals.

A "cupel" was held in the focus of the light from the condensing lenses of the lantern, by means of a ring of copper wire, greatly enlarged image of the same appearing on the screen. The cupel was then highly heated by means of the oxyhydrogen blow-pipe, and a weighed sample of the gold alloy, containing base metal inclosed in an envelope of lead, was then dropped into the white-hot cupel. As the oxidation of the lead and the absorption of the oxide progressed, it formed a dark ring in the bottom. "A little sheet of light was noticed moving over the surface of the molten metal as the non-oxidizable precious metal became exposed to view; then, at the moment that the lead was completely absorbed, carrying with it all the base metal originally contained in the alloy, the purified precious metal became visible as a brilliant globule, reflecting the light falling on its surface like a mirror."

The Electric Light in Factories.

Although the electric light has not yet come into use for domestic purposes, its success for lighting large spaces, such as depots and factories seems assured beyond question. The Riverside worsted mills, at Providence, R. I., have used the light for over a year, with an estimated economy of $14,000 over gaslight. Five dynamo-electric machines with 80 lamps are employed, lighting all of the principal rooms. An extract from the report of the Treasurer of the company is as follows:

They could not have a severer test than we give them, as our mill runs night and day the year through, and we have not had a moment's delay from, or a dollar's worth of repairs on, any of the machines or lamps. The light is all we expected. It is strong and steady, clear and white. It is universally liked by both overseers and helps—so much so that we doubt if we could get along now with the helps if we were to return to the old gas lighting. Certainly we should not get so good work, nor so much of it. We use porcelain globes pretty generally throughout the mill, and we have less complaint of trouble to the eyes than we used to have with gas. The air of the rooms, too, shows a marked difference. In our weaving-room, with its 250 gas-lights, the air became almost unbearable after midnight in summer, and the faded appearance of the men showed how they felt it. With the electric light there is no such trouble, as the air at night is as good as in the day time, and noticeably cooler. The 80 electric lamps take the place of 578 gas burners and effect a saving in cost of $4.73 an hour, or $14,000 a year, as stated above.

PHONEIDOSCOPE.—M. Guebhard describes a method of projecting the colored rings which are produced on the surface of mercury by the breath or by a drop of volatile liquid. He also obtains membraneous rings by substituting a drop of collodion or of varnish for the volatile liquid. These rings may be fixed upon a card and preserved indefinitely. Phoneidoscope figures may be obtained by pronouncing different sounds so that the breath may be intercepted by the mercurial surface.—*Soc. Franc. de Phys.*

THE COMING COMET.—Star-gazers are anxiously scanning the northern skies in anticipation of the coming comet, which has already been seen in the southern hemisphere, and which may make its appearance in the north at any moment. This comet is supposed to be the reappearance of the famous comet of 1843, which blazed out at that time with a most intense brilliancy.

BONE GLASS.—After extracting phosphorus from bones, a glass can be formed from the residue, which consists of lime and phosphoric acid; the ordinary kinds of glass being composed of sand and potash, soda, lime and alumina. Bone glass can be worked as readily as any other glass. It has the valuable property of not being attacked by fluoric acid.—*Les Mondes.*

PHOTOGRAPHS OF THE MOON.—Mr. George Berwick, it is stated, has taken a series of photographs of the moon on very sensitive plate—the bromo-gelatins. One of the plates shows three well-defined rings around the moon. Whether the rings are due to cosmical, atmospheric, chemical or optical causes has not been determined.

Mining Share Market.

The market for stocks is still dropping, aod it does not seem as if prices could get much lower. The present depression shows how much the stock market was dependent ou the Comstock alone for its animation. On that lode, affairs are at a low ebb, owiog to failure in striking bonanzas. Everywhere else on the coast mining matters are more prosperous and "booming" than ever before. Yet, "stocks are down." The "outside stocks" do not show the depression that those on the famous lode do.

A dispatch from Virginia City, April 28th, says: "A blast in the north-header of the Sntro tunnel, to-day, knocked a hole down into the workings of the 1750-level of Consolidated Virginia, the dirt filling a drift completely on that level. The header will be passed in a day or two, and the 30 men—not 300 as reported—laid off, will be returned. Chollar and Belcher are doing nothing except raising water, but the floods in both places are under control."

It seems rather strange that all the Comstock papers should have annouoced the dischnrge of 300 miners, when it was only 30, and it is no wonder that the announcement created such a sensation.

From all parts of the coast come news of rich discoveries and strikes. Our exchanges are filled with snch notices. Arizona is being very thoronghly prospected, and in a few years will prove np a magnificent mineral country. New Mexico will soon come to the front, no doubt. Colorado is all the go jnst now, and great things are expected of the Gnnnison country, which, it is anticipated, will eclipse Leadville. The deposits are of the same character as those of Leadville, but very much more extensive. People are already flocking in that direction. Idaho also is coming to the front, and will no donbt give a good account of herself in time. California is just now somewhat overlooked, owing to more glittering prospects elsewhere. Nevertheless her miners are making money in a quiet way, without much blnster. The mining boom is increasing rather than declining.

The members of the San Francisco Board raised their commission rates to $1 for each transaction under $200, and one-half of one per cent. on all transactions over $200—to go into effect on Monday next.

Bullion Shipments.*

Since our last issue, we have noticed the fol owing bullion shipments:

Hillside, April 26th, $4,000; Paradise Valley, April 22d, $4,286.57; Paradise Valley, April 24th, $4,590.25; Grand Prize, April 26th, $11,600; Con. Virginia, April 26th, $47,470.64; Union Con., April 26th, $41,350; Christy Con., April 23d, $6,707; Standard Con., April 19th, $22,577.08; Northern Belle, April 19th, $6,185.33; Northern Belle, April 21st, $6,506.27; Northern Belle, April 24th, $8,970.13; Contention (Arizona), April 24th, $11,787.26; Tombstone (Arizona), April 22d, $18,548; Fresno Enterprise, April 27th, $15,000; Hillside, April 28th, $4,000.

*Desiring to make our list of Bullion Shipments as complete as possible, we will be thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

ASSESSOR BADLAM and his deputies and clerks are having a busy time of it at present, in order to complete the personal property rolls in June next, as required by the new Revenue law. The roll will be very large, and it is considered probable that the valuation of personal property in this city will exceed last year's valuation hy over $100,000,000.

Resources of Arizona.

In another column we give the first of a series of articles on Arizona, which have been compiled for the PRESS in order to give our readers as full and reliable information concerning that growing Territory as is at present attainable. As we have had to use the testimony of other writers, we can only say we have sought to give our readers the best at command. We intend soon to send a special correspondent to this new and important field, and to furnish every detail concerning the different mining districts and the material resources of the Territory which it is possible to procure. Our correspondent will visit all the mining fields in Arizona and collect such statistics and details as are available. What we now give is somewhat general in its character. So great an interest is manifested in all that relates to the Territory, and especially its mining resources, that we shall spare no trouble to gather and publish such information concerning it as will be of value to our readers.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

OLETA MINES.—Cor. Amador *Ledger*, April 24: The new mines at Oleta have started to work with a small force of men. Another mine is to be opened in that neighborhood this week. Both mines formerly belonged to Figg. Some rich rock has been discovered in sinking. William Coleman, formerly nnder at the Empire, is foreman of this property.

LINCOLN.—Last Friday or Saturday the pump of the Lincoln mine gave out at the 600 level. Upon examination it was found that the valve was out of order. Owing to the unusually heavy rain, the flow of water is very strong.

THE CON. AMADOR is improving. The rock is getting richer as the mine is explored. A large number of hands are kept steadily employed, and the 40-stamp mill is running constantly. A clean-up was made this week that was of a more satisfactory character than for some time past.

THE WILDMAN is tangled up in law, and no telling when a final decision will be reached.

BUTTE.

THE EOCENE TUNNEL & M. CO.—Butte *Register*, April 23: On Friday last the largest mining enterprise in the State was located and recorded in the Yankee Hill mining records. Eleven miles of the North Fork of Feather river bed was taken up for mining purposes by some of the heaviest capitalists of the United States, among whom will be found the names of William H. Vanderbilt, Hon. G. C. Perkins, A. J. Drexel, James C. Logan, G. W. Cummings, Thomas A. Edison, James H. Banker, Hon. P. G. Hundley, Frank McLaughlin and Hon. E. W. McKinstrey. These parties propose to dam the North Fork river at or near the upper end of the Big bend. This will dry the North Fork to the mouth of the West Branch. The waters will be diverted from their natural channel to the West Branch of Feather river by a tunoel. Said tunnel will conduct the water to Dark canyon, which empties into the West Branch 1 mile above the junction of the North Fork and West Branch. This outlet will be 3 miles in length, and consist of 1½ miles of tunnel and 1½ miles of an open cut. The discharge will bo 300 ft lower than the mouth. These 11 miles of the river that will be dried, consist of the richest mining deposits in the world. This project has been talked over for years, but the undertaking was so immense that it was thought capitalists would not engage in it. For years the North Fork has been flumed and wing-damed, and in no instance has it failed to pay well, leaving out misbaps incidental to mining in the river.

YANKEE HILL ITEMS.—Of other mining operations, we can say there bas been a great deal of prospecting, and it has paid well. Williams & Rowe have bonded ther quartz ledge for $20,000, and the parties will take it. Chris. Nate, near this place, has taken out nearly $4,000 in a decomposed ledge. Patterson & Rudd have made big wages this winter at Hump hill, considering the inconvenience of working under ground in such a wet spring. The Big Bar company has washed more ground than they have for years before. The deposit is of the coarser grade of gold. William Pinchoun has been making 3 to 4 ounces per day in old ground. Old Pinchstoun picked up a 21-ounce nugget in Chub gulch. It is a common thing for Mexicans to find nuggets from 2 ounces up to 10 or 12. This part of the county is rich in mines, but poor in capital. There is a prospect of the '49 & '56 company and the Venus quartz company joining and building a 40-stamp mill this coming summer.

CALAVERAS.

GWIN MINE.—Calaveras *Chronicle*, April 24: Additional hoisting works are to be put up at the Gwin mine. Some distance south of the main works is a shaft about 500 ft deep, sunk several years ago. Lately a bonanza has been developed in that portion of the mine and Mr. Gwin has determined to open and sink the shaft above mentioned, as by its use the new ore body south can be rapidly and economically worked. Mr. John Rider, the well-known mechanician and millwright, is to put up the machinery. The new ore body discovered to the south in the Gwin mine is proving both rich and extensive. The mine is paying as well or better now than it did in its palmiest days.

DISASTER AT THE EUREKA.—We learn that the ditch which supplies the Eureka hydraulic with water is broken, and that operations in the mine have been brought to a standstill.

WHISKY SLIDE MINE.—We understand it to be the intention of the Eastern company, now owning the well-known Whisky Slide mine, to put a 20-stamp mill on that property. An agent of the company is now here and members of it will soon follow.

CHAMPION.—There is no diminution of the yield of the Champion. A depth of 600 ft has now been reached, and at that point the ledge is showing even more favorably than anywhere above. To-day the Champion stands as one of the best, most permanent and valuable mine in the State.

WEST POINT ITEMS.—Our mines continue to look good, and our prospects for the future also. I have called at the different mines now working, and find their owners in high glee at their present prospects. Terbur & Co. are taking out splendid quartz on the old Lockwood mine which will assay $80 per ton. I called the other day to have a look at the Lone Star mine. The mine is on the North Fork of the Mokelumne river, where the hills rise on each side over 1,000 ft high. It is at present worked by tunnels, which tap the lode on four different levels. The first, or lower level, being about 150 ft from the bed of the river, is kept running day and night, prospecting along the lode. In the second level they are running a winze on rock that will average $150 a ton, to connect with No 3 level, where they are sinking a winze on very rich rock to connect with the winze of the No. 2 level. I found in every level that the lode looks splendid, full of sulphurets, and prospects big in the "horn." Mr. W. Johnson and R. Smith are taking out rich rock about one-half mile below the Lone Star; likewise Mr. G. and F. Cheek are rolling out bullion in that vicinity. I understand that the old Woodhouse mine is again to be opened, the mine in past years having been very rich. Superintendent Lascy is still running the Hunter's Flat tunnel for gravel.

MARIPOSA.

MARIPOSA G. & S. M. CO.—Mariposa *Gazette*, April 24: This is a new company recently incorporated, and from present appearances there is a fair prospect of its importance to this mining section. Last week Dr. H. H. White, a prominent attache of the above company, exhibited to us quite a quantity of rock taken from the shaft at present being sunk upon the mine, which shows in equal quantities of gold and silver, and without assay appears to predomioate in gold; both, however, are plainly visible, and the rock thoroughly impregnated with the valuable metals. At the bottom of the shaft, which is about 25 ft deep, the vein shows 2 ft.

PAUL'S AMERICANIZED ARASTRA.—One of these machines is now being put up at the Pool mine, near Hornitos, and it is expected that it will be running the first of the ensuing week. Mr. A. B. Paul, the inventor of it, we understand, will be on hand at the starting. It is well known that the ores of Mariposa county contain more or less silver, which is lost by our battery working. Mr. Paul claims that with this arastra a large per cent. of this silver can be saved, as well as an increased per cent. of gold, and that any rebellious metal which may not amalgamate is also saved by concentration.

HAMBLETON S. M. CO.—This company is unincorporated, and is composed of Mr. John Hambleton, Mr. James Hambleton (his son), and Capt. E. T. Cady. They each have a claim of 1,500 ft, which are consolidated into ons company. One of these claims is the original discovery, located some 12 or 15 years ago, on which a shaft was sunk to a depth of 125 ft by J. H Neale, A. W. Jee and others, and ever since known as the Rockwell shaft. The reasons assigned for the abandonment of the works at that time are inexperience in silver mining and not sufficient in sight to meet the expectations of fortune-hunters, when other mines were producing great quantities of gold that could be heard from every day at that early period of mining activity.

NEVADA.

GOOD CLEAN-UP.—Grass Valley *Union*, April 24: A clean-up of 52 loads of Centeonial ore has been made at the Orleans mill, which gave a yield of $4,500, or $86.50 per load. This does not include the sulphurets, which were also rich. There were a number of loads more of the same quality of rock on the dump at the mine, but the bad weather prevented it being hauled to the mill. The lot of rock yielded a higher figure than it was estimated at.

THE NORTH END DISTRICT.—Novada *Transcript*, April 21: Work in the recently-discovered quartz field of the North End district near this city has been pushed ahead as rapidly as the weather would admit of. Messrs. Campbell, Chadwick & Co., who made two locations of 1,500 ft each on cross-ledges at a point about a mile northeast of Kirkham & Hitchcock's mine, have prospected sufficiently to ascertain that they have two good bodies of ore, both of which possess first-class indications of permanency and richness. As soon as the present storm ceases they propose to continue the work of development. The various other parties who have locations in the same section, although prevented by the elements from continuing their prospecting as vigorously as could be wished, feel so well satisfied with what they have already opened up that they are exceeding anxious for the time to come when they can recommence work on the tunnels and shafts.

SHASTA.

SILVER DISCOVERIES.—Reading *Independent*, April 22: Visiting the county seat last Saturday we found things rather quiet, but still some excitement over the discovery of an extensive silver ledge on McGee and Camden's iron mountain; this discovery is reported to be very rich. The good old town of Shasta, as well as the county in general, will be much benefited by this "find," if it proves as rich as reported.

SIERRA.

ENCOURAGING.—*Mountain Messenger*, April 17: After one day's run at the North Fork drift gravel claim, Forest City, recently, a clean-up of 78 ounces of gold was made. The owners who have had many difficulties to contend with in the past, are highly elated over their present good prospects.

SOFT ROCK.—We understand that the Savage company have struck much softer rock in their tunnel. This being the case the work will go ahead rapidly.

WORK.—Mining has been commenced at Eureka, Beard having water enough to begin piping.

THE company which bought the Irelan ground are about to commence a tunnel in Little Rock creek, to prospect the lead. H. Wallis has been appointented Superintendent.

TRINITY.

SPLENDID STORM.—Trinity *Journal*, April 24: While other sections of this State may think they have too much storm of late, it is not so here. Mining cannot be successfully carried on without water, and water is only furnished by good storms, just such as we have been favored with of late. Since our last issue 3.40 inches of rain and 19 inches of snow have fallen, making 35.31 rain and 135½ snow for the season—an aggregate waterfall to date of 47.65 inches. This insures a splendid spring and summer run of water, say until about August. The gold yield of Trinity will doubtless be far above the average this year.

DOING GOOD WORK.—Mr. John Yule, Superintendent of the McGillivray property, tells us that he is now working 14 men in the mine and making a good showing. Although no clean-ups have been made of late, indications are most favorable for a profitable season. Mr. Yule is energetic and a thoroughly practical miner, one who is bound to succeed.

TUOLUMNE.

STARR KING.—Cor. Tuolumne *Independent*, April 24: The Starr King mine is turning out some very rich ore at present; richer than ever before. With the present prospect, and under the charge of our worthy Superintendent, Mr. Alexander, this mine will be one of profit instead of expense, which it has been heretofore.

W. H. HOWLANN'S new mill, which he is trying to make answer in place of stamps, which crushes the ore by means of rollers, has been tried at the Spring Gulch mine, and would have been a success only for the lack of sufficient screens. He has gone below to remedy this deficiency. They run it at Spring Gulch with a small donkey engine. It only required 3 days to put it up in running order, which you can see at once is a profit.

ORE.—Last week while crosscutting in the Spring Gulch, the miners struck a new chute of ore. Our informant saw a piece, weighing about 20 pounds, literally filled with long streaks of gold. If there is any company in Tuolumne that deserves good fortune, it is the Spring Gulch. They have expended a great deal of money in fine mills, hoisting works and general improvements.

COLUMBIA, and the country around its immediate vicinity, has been greatly benefited by the bountiful rains of the past 2 weeks. Mining interests in and around Columbia are looming up in every direction. Never during the history of old Tuolumne county has there been so many capitalists with capital, examining, purchasing, bonding and preparing to extensively work the quartz and gravel mines in every district in the county. What is still better and giving great encouragement to our people, are the new comers among us, who are, as a general thing, men of experience, enterprise and ample means at their command. The work and prospecting so far done establishes the fact, beyond peradventure, that we have in Tuolumne county very many valuable mines.

A NEW and prospectively valuable mine has recently been discovered but a short distance from the town limits of Columbia. Mr. Frank Vassallo and Mr. Alfred Evans are the discoverers and locators of the mine, which they have christened with the name of the Columbia gold and sulphuret mine.

MR. DAVE LEVY has started up work again upon his mine in Wet gulch, situated about 2½ miles northeasterly from Columbia, and near the famous Pine Log precinct. He has come upon some very rich rock in the 100-ft incline. As the developments progress, the ledge is widening out.

THE Vineyard Hill mine, on the easterly side of the county road, near Springfield, owned and worked by Messrs. L. A. Crandall and Andrew Greenman, is now down 45 ft, showing a 2½-ft ledge, which prospects well. In the gulch near where the mine is situated, Capt. Whiteside in early days took out in a short time $10,000, and near by a Mr. Marston something over $5,000.

NEVADA.

WASHOE DISTRICT.

SIERRA NEVADA.—Gold Hill *News*, April 28: From the north drift on the 2300 level, after drilling ahead to guard against water, a drift has been started west on the line of the proposed raise to connect with the main shaft of the mine. This work was commenced but yesterday.

COX. VIRGINIA.—The C. & C. shaft is being continued on down; total depth, 2,330 ft. The joint California crosscut east on the 2300 level continues in a heavy vein material carrying clay and quartz; total length, 85 ft. The similar crosscut on the 2200 level is in vein matter; total length, 315 ft. The bottom of the north lateral branch of the Sutro tunnel is but 9 ft above the top of the drift on the 1750 level.

OPHIR.—To-day a crosscut was started east on the 2500 level joint with Mexican, the object being to reach a point where a raise can be made to connect with the joint winze coming down from the 2300 level.

CALIFORNIA.—Explorations for ore on the 1500 level east of the old stopes goes on. A winze has been started from the 2000 level to meet the raise being made from the 2100 level in the ore vein north. On the 2300 level a drift has been started north to connect with that which was pushed 191 ft south from the Ophir line. When this connection is made the thoroughfare will be opened from the C. & C. to the Union shaft.

UNION SHAFT.—The shaft has been drained of the recent accumulation of water. Should a large increase be encountered in sinking, a sinking pump will be put in position and the influx thus readily handled. The flow of water into the shaft is draining the Sierra Nevada incline. The pumps in the shaft handled all the water encountered and that coming from the Mexican and Sierra Nevada, and are required to make only four strokes per minute.

UNION CON.—The drift, 2500 level, to connect the bottom of No. 1 winze from the 2400 level with the Sierra Nevada incline station on the 2500 level, has been commenced.

CHOLLAR.—Raising water at the rate of 7,000 tons of 2,000 pounds each per day. Of this amount, 5,200 tons are raised by the pumps to the Sutro tunnel level, and the balance is raised by bailing tanks to the surface. The water is controlled, but all other work must be stopped till the flow decreases.

CROWN POINT.—The incline winze is averaging 6 ft per day, on the slope, in additional depth, and is now 420 ft on the incline below the 2700 level. It will reach the 3000 level about the 1st of the coming month.

SAVAGE.—The flow of water encountered in the drift from the C. N. S. shaft, 2400 level, and which was struck Sunday, and filled the bottom of the drift to the hight of 5 or 6 inches, is now conducted to the sumps in a sub-drain.

BELCHER.—The Belcher has a big job of pumping on hand which is liable to last 2 or 3 days yet. Until the flood is reduced from the 3000 level no air can be spared to ventilate and resume work on the 2700 level.

YELLOW JACKET.—The shaft has attained a perpendicular depth of 2,905 ft, the bottom in harder rock; no increase of water.

BRISTOL DISTRICT.

STARTING UP.—Ploche *Record*, April 17: The finishing touches were put on the Hillside water jacket last Wednesday and connections made preparatory to starting up on Monday. The furnace is a model of beauty and pronounced by John Reynolds, the foreman of the Richmond, as being the most perfect and finest of its kind in the State.

AT the mill site of the Bristol mill and mining company work in setting the boiler and engine in connection with the boring apparatus was completed yesterday, and operations will soon commence sinking for flowing water.

EUREKA DISTRICT.

NOTES.—Eureka *Sentinel*, April 24: A company of miners are negotiating with the owners of the Metamoras mine for a lease of that property, and if satisfactory arrangements are made work on an extensive scale will be commenced about the 1st of May. An important series of mines on Adams hill have been bonded to an English company, and everything indicates that a sale will be made at an early day. W. H. Taylor & Co. have been extracting about two tons of ore daily from the San Jose, on Prospect mountain, since the last important strike was made, the ore averaging from $120 to $165 per ton. Mr. D. K. Ralston, who is largely interested in the Bayard Taylor Con. and Maryland tunnel, intends returning to Eureka about May 1st, and will commence work on both properties soon. Mr. Jerry McMahoo was in town last evening making arrangements for the shipment of ore from the Grant mine to the Richmond furnaces, and reports the mine improving.

STRIKE IN THE EL DORADO.—What promises to be a development of great importance, has been made in the El Dorado mine, Prospect mountain. The ore was struck in a drift between 150 and 100 ft from the surface. The extent of the body is not yet known. It was cut on one side of the drift, and it has maintained this position for about 10 ft. Good judges say the samples brought down will assay from $400 to $500 per ton, going very high in gold. Mr. Reilley thinks he has, at last, got a bonanza, and feels much encouraged. He has industriously pursued a fruitless search for ore for the past year, never having struck as much as a trace until now. The El Dorado has, in the past, been one of the best paying mines on Prospect mountain. Several parties have made handsome piles out of it. The mine, in all, has probably yielded in the neighborhood of a quarter of a million. It is the property of the Ruby-Dunderberg company. Mr. Reilley has a two-years lease of it.

Two prominent mines were bonded yesterday for the Eastern market. We are requested to withhold names and particulars for the present.

MOUNT ROSE DISTRICT.

WORK TO BE RESUMED.—Paradise *Reporter*, April 17: Operations will shortly be resumed on the Big Prize and Mount Rose mines, in Mount Rose district. A complaint has been heard on all sides about the management of these claims, but doubtless the speedy resumption of work will silence the murmurings of the dissatisfied stockholders.

PARADISE DISTRICT.

STRIKE.—Paradise *Reporter*, April 17: The Paradise claim is reported to have encountered a rich and extensive ore body in No. 4. The Paradise company employ a force of 40 men, ships nearly $20,000 monthly, have extracted over $250,000 since the incorporation, less than 2 years ago, and claim to have sufficient ore in sight to run a 20-stamp mill for 2 years; still the stock operates like a wet blanket on the prospects of the camp, and drags heavily along at 50 cents per share in the San Francisco market.

THE negotiations for the transfer of the "Bullion of Paradise" stock have fallen through, the timid New Yorkers having forfeited the bond by failing to comply with the cash stipulations of the agreement.

SOME very rich ore is being uncovered in the Bullion winze, and the mill is crushing, on an average, 18 tons daily.

THERE is every indication that the mining industry of this vicinity will be prosecuted vigorously during the ensuing season.

PIOCHE DISTRICT.

CONCENTRATING WORKS.—Piochc *Record*, April 17: The concentrating works of W. J. Montgomery at Bullionville, concentrating the Raymond & Ely tailings, are now an assured success. He has now put up four tables and run railway tracks down to the pit and is concentrating 100 tons of tailings per day. These are being shipped as rapidly as teams can be procured to the furnaces in Utah for reduction. Mr. Montgomery, if he makes the necessary arrangements with the American Flag M. & M. Co., will erect a furnace and smelt his concentrations at Bullionville instead of shipping them. There is in the tailing pit over 250,000 tons of tailings, which the Raymond & Ely company can sell at any time at $1 per ton.

RAYMOND & ELY.—The Raymond & Ely mine and mill have been mortgaged to Messrs. Sazard Freres & Cahn, of San Francisco, for $105,675. Captain Garber arrived one day last week and took possession of the property. The people of Pioche were thrown into excitement over the occurrence. Some of the miners, after working a day or two under the new order of things, threw up their jobs. They were told to go to the office and get their money, but when they presented themselves they were offered 30-day drafts on San Francisco, which they declined, a few of them filing labor liens on the property. Captain Garber informed the *Record* that the mine would be worked the same as usual under the new management, and that the transfer would redound to the best interests of Pioche.

SILVER KING DISTICT.

LOOKING WELL.—Pioche *Record*, April 17: The mines at Silver King district are looking well. Developments are being rapidly pushed ahead and sinking has already begun upon the Cæsar and Highbridge mines.

SILVER PARK DISTRICT.

RESUMING ACTIVITY.—Pioche *Record*, April 17: This

CONTINUED ON PAGE 284.

The Microscope in Geology.

Abstract of a short lecture delivered before the S. F. Academy of Sciences in November, 1878.]

I have thought that a short account of the important results that have been brought about by the introduction of the microscope as an instrument of geological research, might prove not uninteresting to the members of the Academy.

Geology, although the youngest of the sisterhood of natural sciences, has nevertheless made most rapid progress toward the condition of a true inductive science. But its progress has been unequal in different directions.

Since Lyell first gave us the key to dynamical geology in his doctrine of the interpretation of past geological phenomena as the effects of existing forces acting upon and within the earth, and since Buffon first made clear to us the true significance of the organic remains of the sedimentary rocks, progress in the direction of *dynamical* geology and in the direction of *historical* geology has been rapid and satisfactory. The same cannot be said, however, of the branch of geology known as *petrography* or *lithology* which has for its object the study of the mineral constituents, structure, and relative position of rocks in order to arrive at a true conception of rock-genesis or rock-formation.

A portion of this subject is well understood. The formation of sedimentary or stratified rocks, such as sandstones, marls, shales, clays, etc., goes on under our very eyes, so that we have but to observe carefully and the whole process becomes clear. The formation of sedimentary rocks, then, is well understood. Not so, however, that of the rocks known as crystalline schists, and the massive, igneous, or eruptive rocks.

I may be pardoned if I devote a few moments to a brief exposition of the nature of these different rocks. A clear conception of their general character, at least, is essential to a just appreciation of my subsequent remarks.

First, as to the difference between a *mineral* and a *rock*. I will give you the strictly scientific definition which I give to my students in mineralogy: "Any homogeneous solid or fluid body, which is a direct production of nature without the agency of organic processes," we call a mineral. A rock, on the other hand, consists of two or more minerals intimately mixed. The essential idea of a mineral is *homogeneity*, both of molecular structure and chemical composition; of a rock, *heterogeneity*, of either or both. The definition of a rock, however, is still farther extended to include minerals occurring in very extensive deposits.

There are many different kinds of rocks, differing in structure, mineral composition and genesis. We distinguish:

I. Clastic or fragmental.
II. Crystalline.
III. Amorphous.

A careful examination of a large number of rocks shows that they are composed entirely of the fragments of pre-existing rocks which have been bound together by a cement or by great pressure, or both, to a more or less compact mass. To this class of rocks we give the name *clastic* or *fragmental*. It comprises the sedimentary rocks, sandstones, shales, clays and the like. Another large class of rocks are composed either of crystalline mineral grannles in immediate juxtaposition, *i. e.*, without any cementing material between them, such as granite, or cemented by a glass like many lavas.

These rocks are distinguished, according to the size of their granules, into *macro-crystalline* (distinctly crystalline) and *crypto-crystalline* (concealed crystalline), and, according to the mutual position of their grannles, into *shistoid* and *massive*. The third class, comprising the amorphous rocks, is of much less extent than the other two, although it is of great genetic value as throwing light upon the true nature of many of the crystalline rocks. It includes the natural glasses, obsidian, pumice-stone, pitch-stone and the like.

Now, as I observed before, the composition and genesis of the clastic or fragmental rocks is well understood. It is in these macro, and crypto-crystalline, shistoid and massive rocks that the great interest in petrography centers itself at the present time. It is in these that the great work is being carried on.

We have seen that rocks are often developed crypto-crystalline—*i. e.*, apparently homogeneous—and up to comparatively recent times such rocks passed for *really* homogeneous mineral substances, whereas in fact most of them are just as heterogeneous in composition as granite, consisting of three, four, five or more minerals, these minerals being quite different for different crypto-crystalline rocks. Sometimes their composite character was recognized, the exact mineral composition, however, being entirely a matter of conjecture. Is it to be wondered that such great confusion should characterize this branch of geology as does actually exist? Rocks of widely different nature are classed together under one name, because they are crypto-crystalline and of the same color, and on the other hand similarly constituted rocks are as widely separated from ignorance of their true character.

What would the modern zoologist say of one who classed the porpoise, the whale and the shark together and denied the value of specific designations because all lived in the water and were of nearly the same color? And yet this is exactly what most of our American geologists do when they speak of the rock *trapp* for instance, a term under which is included a great variety of rocks of different mineralogical composition, structure and geological position, but all possessing in common the characteristic crypto-crystalline structure and black color.

In consequence of this condition of things, it is simply impossible for two geologists to talk with each other about igneous rocks without continually defining the meaning they attach to the names they use.

In view then of the misapprehension and ignorance of the true nature of this most important class of rocks, is it strange that in the course of the development of the sciences of geology many wild theories of rock-genesis should have been suggested and defended even by eminent geologists, theories for which there existed not a particle of foundation in fact? It is in this, as in all of the natural sciences, all speculation, all theory, all hypothesis must be based upon accurately observed facts. Every separate mineral, every peculiarity of structure, every crystal-form even, is the expression of some condition (we know not how important) that existed at the time of the formation of the rock in which they are observed. And it is only when we know the minerals accurately, when we are familiar with every peculiarity of structure and crystal-form, that we can reason backward to the conditions of which they are the expression.

It is right here that the microscope has, comparatively, recently come to our aid. Not only are we now able to study the intimate structure of the coarse granular (macro-crystalline) rocks, but, in extremely thin sections, by means of its aid, the indefinitely small crystallins granules which make up the crypto-crystallins rocks can be accurately investigated. Their mineralogical nature and the detailed structure of the rock can be definitely determined, and we are thus enabled to throw some light upon its genesis.

Not of *all* rocks, however, some few are still involved in absolute darkness. Nothing can be determined about them—composition, age, genesis are all a mystery. Many geologists do not recognize this fact. Present to them such a rock and they will easily and quickly give you a name for it. It will probably be "trapp." But such man have so long deceived themselves with regard to this entire class of crypto-crystallins rocks, that they have come to think the whole matter very simple. It is a great mistake however. In no department of natural science are we treading upon such uncertain ground as in petrography; unsolved and apparently unsolvable problems meet us at every turn, and until within a very few years geologists have been compelled to acknowledge that they knew scarcely more of the true nature and origin of the crystallins rocks than they did nearly a century ago. No method of investigation applied to the rocks, however, has been attended with such peculiarly gratifying success as the microscopic study of thin sections. It has thrown a flood of light upon a class of rocks hitherto the most obscure, and with its aid the whole subject has for the first time been reduced to some kind of system. It may be premature to speak of "system" yet. Rather let me say, that in the last ten years an enormous amount of material has been collected, and is still being collected, out of which future systems will be formed.

Perhaps no better instance than this can be adduced of the reanimating effect upon any department of science of the introduction into it of a new method of investigation. Further progress in the direction of petrography seemed to be at an end. Chemistry had grappled with the problems presented, had worked long and faithfully, but had finally been compelled to acknowledge herself unable to solve them. Then, after a space, came the microscope. Just as the telescope, in the hands of Galileo, first gave us a true conception of the creations and processes of *infinite space*, and infused new life and spirit into astronomical research, so the microscope, in the hands of Henry Clifton Sorby, first gave us a true conception of the creations and processes of *infinite time*, and reanimated to a wonderful degree geological research in this direction.

On the present occasion I desired simply to call your attention to the nature and extent of the vast field of activity that has been within a comparatively short time opened up to the geologist in the direction of microscopic petrography. The strife which has so long been waged between the Plutonists and the Neptunists has been transferred to this new field of observation, and no geologist, who would contribute his share to the solution of the many intricate questions involved, can afford to be ignorant of the results nor altogether unfamiliar with the methods employed.

At another time I will give you some more detailed accounts of these methods and results, and indicate their bearing upon the important questions of rock-genesis.

A. W. Jackson, Univ. of Cal., Berkeley.

Mining Experts in Colorado.—The Ouray (Col.) *Solid Muldoon* says that under the local mining laws of Ouray county, mining expert scalps will be taken at $4 each in payment of taxes. When a New York mining expert arrives in Ouray with letters of recommendation from "prominent Eastern capitalists," he is given just four hours to skip, and he generally skips.

The Concentration of Ores.

There are undoubtedly now lying in the Comstock mineral belt, in the ground that has been passed by in the downward race after the sugar plums in the shape of bonanzas, many more millions than have ever been extracted. The great lode has thus far been gouged; everybody has been going for the cream of it. When ore would not pay in bulk, just as dug down from the vein, it has as a rule been passed by. Some little assorting, so called, has always been done in the mine and at the time of digging down the ore. It could hardly be called assorting even, as it consists merely in digging out the richest ore and rejecting the poorest. Sometimes men merely looked over the entire mass as dug down and threw out such of the larger blocks of porphyry as they happened to see. Very little pains has ever been taken in this business, as Superintendents and owners of mines have always been in haste to get on down in the expectation of finding something richer—bonanzas, where solid masses of black sulphurets and chloride ores could be blasted down, shoveled into cars and shot up to the surface and away to the mills.

Where a block of ground would not pay as it stood, or with slight and hasty assorting on the spot, it was left behind and it is there yet. No one has ever tried the experiment of making one ton, or half a ton of two tons, of rock that would not pay for reduction as it stood in bulk. Even in ore of low grade that will pay a small profit for working it would seem that there would still be economy in concentration if it could be cheaply done, as there would then be a much smaller bulk to be treated in the amalgamating pans, smaller quantities of chemicals would be required and the material could be more carefully worked.

In the Leadvills country they are working mines where they are obliged to concentrate from the start—to concentrate all the ore taken out—and these mines are considered great properties. Our people should begin to look after the machines and apparatus by means of which these results are achieved. We have millions of tons of low grade ores in the croppings of the Comstock, and at slight depths below these croppings, which will pay by making one ton or half a ton of what is now two tons of material. This is quite certain, as even now persons are gouging into these croppings in several places, and by men hand assorting are getting out ore of which a ton must be worked through pans and all else as a ton, and must therefore pay as much as any other ton extracted on the Comstock.

It would seem that with some cheap and rapid method of concentrating—either dry or by means of water—that employment should be found at fair wages for the hundreds of men now idle on the Comstock, and the thousands who would flock hither, could they be sure of work at which they could lay up some money.

The experiment of concentrating base metal ores will soon be tried here. Although this is a thing somewhat different from what we have been talking about above, yet it is a beginning and a move in the right direction. The experiment of which we speak is that of concentrating the base metal ores of the North Bonanza and Flowery mines. Mr. Jackson, Superintendent of said mines, has left for San Francisco to examine some of the machines used for the concentration of ores, and for the purpose of making other arrangements with a view to setting up concentrating machinery on Six mile canyon, near his mines.

In this business of the concentration of ores is a splendid field for inventors, for there are millions in it. We think it will yet be seen that in the final cleaning up of the Comstock more money will be taken out than in the first dash at the cream. It will be as in California in the early days, where, in many instances, those who worked mines the second time took out more gold than did those who first worked them.—*Virginia Enterprise.*

To Reduce Miners Wages.—It is being hinted in some of the papers in the western part of the State that an effort is shortly to be made to reduce miners wages. If the effort is made the *Sentinel* hopes it will prove unsuccessful. Miners get little enough, with the present cost of living in this State considered. If it is desired to reduce the expenses of mining the rates of transportation should first be assailed. The labor account is a small item in comparison with the cost of mining supplies in general. No miner can live and support a family on less than $4 a day. At best they do not get steady employment, and their earnings are not one farthing more than they should be. The *Sentinel* will always oppose any reduction in wages until miners can support themselves and families for one-half what it now costs them.—*Eureka Sentinel.*

Air Motors in the Sutro Tunnel.—The Gold Hill *News* says: Four compressed air motors, manufactured by the Grange Iron Company, Durham, England, will be used in transporting material, rock, etc., through the tunnel. Each of these motors or engines has an extra air receiver, all of which will be supplied with air from a stationary receiver at the station at shaft No. 2 as they pass in and out. The motors are each five feet high, and are built on the same plan as those in use on Second avenue, New York city, where they serve as power for street cars. Each motor, with its extra receiver, has a capacity for hauling 40 carloads (two tons each) of rock from the header.

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions* rendered upon patent cases in litigation, for the benefit of our readers:

Imhaeuser vs. Buerk.

Supreme Court of the United States—Decided October term, 1879. Mr. Justice Clifford delivered the opinion of the court.

1. Equivalents may be claimed by a patentee of an invention consisting of combination of old elements or ingredients as well as of any other valid patented improvement, provided the arrangement of the parts composing the invention is new and will produce a new and useful result.

2. The term "equivalent," as applied to a combination of old elements, is special in its significence and somewhat different from what is meant when the term is applied to an invention consisting of a new device or an entirely new machine.

3. In the former case it means that the patent in respect to each of the respective ingredients comprising the invention covers every other ingredient which in the same arrangement of the parts will perform the same function, providing it was well known as a proper substitute for the one described in the specification at the date of the patent.

4. When the thing patented is an entirety, consisting of a single device or combination of old elements incapable of division or of separate use, the respondent cannot escape the charge of infringement by alleging or proving that a part of the entire invention is found in one prior patent, printed publication, or machine, and another part in another prior exhibit, and a third part in another, and from the three or more draw the conclusions that the patentee is not the original and first inventor of the patented improvement.

5. The burden of proving infringement is upon plaintiff or complainant, and never shifts if the charge is denied in the plea or answer.

6. Sufficient proof of infringement may be derived from the comparison of that which is used by the defendant with the description of the invention given in the specification of the patent which constitutes the foundation of the suit.

Appeal from the Circuit Court of the United States from the southern district of New York.

Exceptions were taken to the Master's Report, but the rulings of the court in respect to the amount adjudged to the complainant for the infringement, not having been assigned for error, are not the proper subject of re-examination.

Decree affirmed.

Liggett & Myers' Tobacco Co. vs. Miller et al.

United States Circuit Court, Eastern District of Missouri—Decided March term, 1880; McCrary, Justice.

1. The proceedings contemplated by section 4,918 of the Revised Statutes contemplate an ordinary proceeding in chancery. It is an adversary proceeding, in which the party must file the usual bill in chancery and issue the subpœna required by the chancery practice.

2. No law in the United States makes provision for the service of any process outside of the district, and section 4,918 does not permit the Circuit courts, by the issuing of a notice of the filing of a bill to declare an interfering patent invalid, or by any other process to bring before it citizens from any and every part of the United States to have their rights adjudicated there.

3. Such section clearly contemplates that the ordinary course of equity proceedings shall be pursued, and that the judgment shall operate only so far as the jurisdiction of the court shall extend.

Motion to quash notice is sustained.

Howes et al. vs. McNeal.

United States Circuit Court, Northern District of New York—Decided Jan. 15, 1880; Blatchford, Justice.

1. The file-wrapper contents and drawings of a patent set up in defense in an action for infringement are not competent to show that the invention described in such patent was made at the date of the oath; nor is it the proper way to show reduction to practice and use of the invention, so as to invalidate the patent issued upon.

2. When patents are cited as anticipating the plaintiff's patent they speak only as public grants, and nothing from the Patent Office can be admitted in evidence of earlier dates than the patents themselves.

3. The preliminary papers filed in the Patent Office are merely the declaration of third persons not parties to the suit or connected with them in interest or title, and are incompetent as hearsay and secondary.

In this case a motion is made by the defendant that copies of three file-wrappers, contents and drawings in the matter of three several letters patents may be made a part of the defendant's exhibits and proofs with the same effect as if they had been put in evidence when said three letters patent were put in evidence, or that the suit be referred back to the examiner with leave to the defendant to introduce such evidence, or that it be referred back for both parties to introduce further proofs, and that the interlocutory decree made herein be so far opened as that the defendant have leave to reargue the case after such new evidence shall have been received, with the same effect as though the same had never been argued.

The motion is denied in all its branches.

ACTING COMMISSIONER'S DECISIONS.

Rice ve. Burt et al.

Motion to Dissolve Interference—Decided Mar. 6, 1880; Doolittle, Act. Com.

1. A mere aggregation of processes, each accomplishing independently of the other its well-known result, not patentable any more than a mere aggregation of mechanical device.

2. Hence a claim for the "process of purifying common salt, consisting in washing the salt, after being taken from the graniers, with brine and decomposing any remaining earthy chlorides with carbonate of soda by mixing the salt and carbonate of soda together," rejected in view of separate references describing, first, washing the salt, after being taken from the graniers, with brine; and, second, decomposing the earthy chlorides by mixing the salt and carbonate of soda together.

---

* More complete reports of the proceedings may be found on file in the office of the Mining and Scientific Press Patent Agency, 202 Sansome street.

Cement for General Use.—For joining paper, card-board, or model work, or similar articles a good glue can be made of glue, vinegar, and alcohol. Dissolve 2 ounces of the best transparent glue in a quarter of a pint of strong cider vinegar. Let it simmer slowly by placing the dish containing it in a dish of boiling water. When it has become liquid, add one ounce of highest-proof alcohol, and keep it tightly corked. If solidified by cold, heat in hot water when needed for use. Dilute acetic acid may be substituted for the cider vinegar.—*Chemist & Drug.*

A Queer Bone-Anza.—The shaft of the Rosebud mine is down about 110 feet, and presents some queer phenomena. On one side of it for many feet the porphyry has been thickly interspersed with promising ore, and on the other it is a solid mass of old jawbones, skeletons of men and animals of races long extinct. A bonanza of mingled gold and fossils is something new even in this wonderland.—*Black Hills Pioneer.*

On the Gum-lac from Arizona.

[Read before California Academy of Sciences, Mar. 1, 1880.]

In a previous communicatiou I gavo a description of the properties of a resinous incrustation on the twigs of the *Larrea Mexicana*, which seems to be identical or nearly ideatical with the gum-lac of Iodia. I mentioned, if I remember correctly, in that communication, that the same or a similar gnm was said to appear on the so-called "cat-claw" of Arizona. Since writing that communication I have come into possession of a small bundlo of twigs of that plant, which has bceo identified for me by Prof. Hilgard, of this University, as the *Acacia Greggii*, a deciduous shrub or tree common in Arizoaa and Mexico. The twigs were coated with a scantier deposit of the gum than tho twige of the larrea possessed, and the irregnlarity of tho surface of the resin also appears to indicate that the acacia does not presont ao favorable conditions for the production of the resiu as tho larrea.

In its general properties and chemical reactions, the lac from the acacia agrees with that from the larrea. It softens at low temperatures, possesses the samo peculiar aromatic odor, dissolves partly in alcohol, almost entirely in caustic potash, dissolvcs in borax solutions on boiling, and is again reprecipitated hy acidulation. Its solutions in canstic potash and borax possessed a red color, but not the deep purple-red of the lac of the larrea. The amonat of coloring matter is decidodly less. On boiling with water, no red coloration was produced in the extract. On addiag an alkali to this water, however, the color is immediately turned red. I noticed, however, that quite an appreciable quantity of alkali had to be added before this was effected, ehowiag that eome acid was present in the extract which had first to be neutralized before the coloring matter hecame visible. The question suggests itself whether this may not bo the laccic acid of Dr. John—(Muspratt.)

The specimens of acacia-lac were collected dnriag the season when the twigs were dry and the leaves dead, and none of the specimens examined contaiaed the massee of egge with red juice in the ccile. The cells were dry and contained only the dried or nearly dry sacs. It is therefore not improbable that if collected at other seasons the dye would he present in greater quantity.

From observatione hy a number of gontlemen acquainted in that region of the country it appears that the larrea-lac is very widely distributed through Arizonia and the southern part of California (notably the Mohave and Colorado deserts), and the resinous gnm is used in the place of eolder for mending kettles, etc., by the inhabitants. This nse is suggestive of the use of the India-lac for the manufacture of sealing-wax. Whether the lac from either or both of these sourcee will prove of important commercial value, will depend on the quality and cost of prodnction of the shellac prepared from it.

J. M. Stillman.

University of Cal., March 1, 1880.

El Dorado County Mines.

In tbis connty there are a great many mines, placer, hydraulic, quartz, porphyry, gravel, and one silver mine. And all kinde are being worked more or less. Some are only slightly prospected, some are partially opened up, but very few have had work enongh done on them to show what there is to be found in them, as to extent, depth, and, therefore, as to their valne. As time rolls along capitalists and experts, reaching for good property to place their money in, come to El Dorado county, see some one of the many that pleaee their fancy, and invest in it. Within the last year a great number of our mines have been purchased by Eastern, European and California capitalists, and ae nearly all of them are going to do more or less work on tbem this summer—many being at work now—we are certain of a good seasoa of mining business.

The mines of this county are yet to be the best in the State, and, as the county contaias eo many different kinds, almost any class of mining capitalists and experts can be suited. Immease deposits of gravel are yet to be washed down, and the amount of ground that will pay largely to hydraulic is yet to be measured, as it extends the entire length of the county, and almost its width.

The pocket leads are legion, and an immense amount of gold has been, and is now being taken ont monthly from these porphyry streaks, often running up to tbousands of dollars from one in a week.

Bnt in our quartz mines our permanency as a mining community exists. There has never been one mine snnk deep enough, nor had work enough done on it to find where the pay rock ceases. The only one that has come anywhere near being developed is the Placerville gold quartz company's mine, and they have just put up and are working a new 20-stamp mill, with new hoisting works, and everything complete, and they do this hecause they have sunk deep enough and know perfectly well what is above them, and know that what is in eight is a good investment for their expenditure, and, as to what is under them, whether good or bad, their investment ie good. No one hae snnk down any deeper than they have on thie divide, and there is no reason to helieve that the mines are not better the deeper they go down, even helow the lowest depthe of the "old Pacific."—*Mountain Democrat.*

Useful Information.

Dyes from Camphor.—Dr. W. H. Gregg, of Elmira, N. Y., is reported to have succeeded in obtaining a new coloring principle from camphor, to which he gives the name of "Lanrelioe." Thus far he has only succeeded in producing various shades of yellow from it; but he is reported to be engaged in certain experiments which he hopes will result in the production of carmine and scarlet. The chief feature of the cew dyestuff which recommeads it to the attention of textilo manufacturers, is in the brilliancy and fastness of the colors. It can be used upon linen, cottoa and silk with no apparent differonce in dcusity and hrilliancy, and goods thus dyed are eaid to be entirely unaffected hy the ordinary tests to which they will be subjected in use. Boiling for hours in a strong eoap solution barely turaed the shade of a cotton samplo. With indigo, a handsome green is produced. The inventor is not yet prepared to givo special details respecting the cost of produciag the new dye, or of tho precise methods of nsing it; but as regards tho first item, he intimates that it will be one of tho cheapest, and as to the sscond, ono of the eimplest coloring mattere to make and apply. The textile journale speak in terme of great interest of the new discovery.

Gold Wire.—An interesting mechanical operation is the maaafacture of gold wire for what is known as gold lace. The refiner firet preparee a solid rod of silver about an inch in thickness; be beats this rod, appliee npon the surface a ehcet of gold leaf, burnishes this down—and so on, until the gold is about one-hundredth part the thickness of the silver. The rod is then subjected to a train of processes which brings it down to the stato of fine wire, when it is passed through holes in a steel plate lessening step by etep in diameter. The gold never deeerts the silver, bnt adheres closely to it, and ehares all its mutations; it is one-hundredth part the thickness of the eilver at the beginniug, and it maintains the same ratio to the end. As to the thinness to whicb the gold-coated rod of silver can he brought, the limit depends upon the delicacy of human skill. It has been calculated, however, that the gold actually placed on the very finest silver wire for gold lace is not more than one-third of one-milliontb of an inch in thickness, or about one-tenth the thickness of ordinary gold leaf.

Manufacture of Lager Beer in Small Quantities.—The following recipc ie said to make an excellent beer for home use: To make 5 gallone of beer, take somewhat more than that quantity of soft water, euspend in the vessel containing it a bag with about two ounces of hops, and boil for about half an hour; then add abont 3 pounds of gronnd malt, or, if preferred, a quart of thick sugar syrup (or of molasees); allow the whole to boil up several times, then pour the decoction in a tuh or vat. As soon as it has become say luke-warm, add to it about a half pint of good brewer'e yeast, and allow the whole to remain in a cool place to ferment. At the expiration of six to eight days, it will have become quite clear, and may then be bottled. This beverage may be made stronger or weaker, or more or less bitter, by varying the above proportions; and, when prepared according to this recipe, ie said to make a refreshing and pleasant drink, which will keep very well in a good cellar.

A Bed-Bug Trap.—Edison may be a chieftain among inventors, but if he had lived 3,000 yeare before Christmas he never would have dropped on euch a family blessing as our mining friend, Tom Ortou, did when he accidentlly left his cribbage board in the blankets at the foot of his bunk. Tom didn't have bugs, but his bed did, and had 'em bad. After tbe crih-hoard had been in the bed all night hie eagle eye made the discovery that moet of the holes had been located by enterprising bugs, and he instantly "tumbled" to the idea. False head-boards, foot-boards, and side-boards, bored with innumerahle gimlet holes were provided, and every morning the boards were taken out and the locators scalded. The mortality among the bugs has been fearful since the inventiou, and the hoys down that way, as they roll into their blankets, and drop peacefully into pleasant dreams, pray for blessings to fall on the inventor of the "Orton Thousand-Holed Crib-Board Bed-Bug Destroyer," which has brought peace, rest and comfort to the sleepers of the North Fork.—*Plumas National.*

Sponge Cloth.—A Berlin inventor has patented a new kind of cloth, wheh consists principally or entirely of sponge. The eponges are first thoronghly beaten with a heavy hammer in order to crush all the mineral and vegetahle impurities, so that they can be easily washed out. They are then dried and pared, like a potato, with a sharp knife, the parings beiag sewed together. The fabric thus obtained is free from all the danger which sometimes arises from the absorption of poisonons dyes into the system. It absorbs without checking the perspiration, so as to diminish the danger of taking cold. It is a bad couductor, and therefore helps to maintain a uniform surface temperature. It can be more readily cleansed than the ordinary woolen garments. Its flexihility diminishes the liability of chating. The ease with which it can he employed in shoes, stockings, underware, hat linings and other articles of clothing, seems likely to make it especially useful as a protection against rheumatic and pulmonary attacks.

Conversion of Cane Sugar into Grape Sugar in Cooking.—At a sanitary convention in Grand Rapids, Michigan, recently, the President of the State Board of Health called attention to the bad practice among cooks, by which cane sugar is converted iato grape sugar in cooking, thereby loosing more than half of its sweetening power. Some women, he said, will put the sugar in with a mass of acid fruit to be cooked, and keep cooking and keep adding sugar while it keeps on growing sonrer, until at last they will use two and a half times as much sugar as they ought to secure the desired results. The cane sugar has been changed to grape sugar. Now, if tho sugar had been added after the fruit was cooked, much less would have been required, and the result would have been far more satisfactory.

Petroleum in France and Italy.—A Franco-Italian company has besn formed to explore southern Europe for petroleum. Experts, with boriag apparatus, have been brought from the United States, and the local authorities have promised liheral aid to the undertaking. The first wells are to be sunk at Tocco, in the Abruzzes, and at Rivanazzano, in Lombardy.

Considerable has been writtea about toughened glass as a material for railway sleepers, and now Mr. Bucknall, of Eagland, intends to manufacture toughened glaes pipee for water and gas works, for drains aud chemical pnrposes, ae well as transparent bricks, telegraph insulators and numeroue other articles.

In buying rubber goods, as car-springs, buffers, etc., chooso light ones; heavy onee are loaded up with barytes to make the weight. Color is no test. Never buy old india rubber goods, as that material deteriorates with age.

Clearance for narrow eaw blades may be given, without either epring or spread set, by griuding the back to a knife edge. This is especially useful for keyholé, pruning and fret eaws.

To prevent nickel plating from scaling off from iron or steel objects, copper them first by battery or by simple immersion in a strong solution of sulphate of copper (blue vitriol).

Good Health.

Boys and Tobacco.

A very large proportion of the boys of the present day use tobacco in some form. Their favorite method of poisoning themselves is with the paper cigarette. Boys of very tender years may often be seen with lighted cigarettes in their mouths, puffing away with more industry than would in most cases be shown if they earned their living by it. The effects, in the first place, are not usually pleasant, but during the process of tobacco seasoning, the average boy exhibits considerahle fortitude. We presume very few of these lads realize the inevitable consequences of smoking during the growing period, when bones and musclee are developing. All boys want to be strong and vigorous—to have sound bmbs, hard muscles and rich blood. But if medical science can establish any fact, it is that the use of tobacco in youth checks growth, arrests muscular development, and impoverishee the blood. A physician made test cases of 38 boys, from 9 to 16, who had been in the habit of smoking, and in 27 of the 38 he found ohvious injurious effects. In the remaining 11 the consequences were not so pronounced, but it by no means followed that the seeds of premature debility were not eown. The impairment of nervoue force, which inevitahly results from the use of tobacco, involves a long list of disorders, which take one form or another, according to the constitutional tendouciee of the individual. One of the most common and prominent effects is the impairment of growth. Thie is a misfortune from which there is no remedy. The system may be cleansed and purified, after having arrived at maturity, but the human structure cannot be set to growing again if development ie arrested in the latter yoars of the growing period. Many boys do not know the consequences of their habits, and others, with the disregard of future penalties peculiar to the boy period, do not care what the consequnces mey bs so that their present pleasure is enhaneed. There are hut few boys, however, who would remain insensible to appeale to their reason and to their pride in manhood. It is better, as a rule, to convince a boy that the use of tobacco is injurious, than eimply to convince him that physical chastisement will follow his being caught using it.—*Call.*

Local physicians of Los Angeles say the past winter has been the healthiest in their recollectiou. They ascribe this result to the unusually cold weather which prevailed for some weeke. The cold ecotched and killed the seeds of the zymotic and malarial diseases which are sometimes engendered by wet winters.

Danger from Leaks in Pipes.—An examination made by the Boston Board of Health to discover leaks in pipes by the use of strong volatile oils, show that more than one-half of them were defective and leaky. Thie well illustrates the need of official inspection of bonse fixtures.

Pathological Effects of Starvation.—Tbe autopsy of the remains of the woman who starved herself to death in Cincinuati has not revealed any matcrially diseased condition of the stomach. The fact that she lived 30 days without using any nourishmeut whatever, would justify the conclusion that persons possessed of strong will power, and having the hallucination or delusiou that they are suffering with some orgaaic disease or bodily disorder, may live until the body is entirely consumed. This lady was possessed of great power of will, and she had a delusion that she had no stomach, and, therefore, made up her mind that she wonld not take food or drink, and continned in this condition uutil there was a gencral exhaustiou of the nerve centers and mental faculties, when she went quietly into a calm sleep and died without a struggle. The pathological condition of the passagee leadiug to the stomach, all being normal with no obstruction, and all the organe in a healthy state ready to perform their various offices, wonld warrant the conclueion that thie lady would have lived many years if she could have been induced to partake of sufficient nourishment to eustain life.

Bread.—The indigestion and dyspepsia so rife in the United States can be traced almost directly to the use of alum in bread-making. Alum is an astringent, and taken into the stomach daily cannot fail to produce chronic constipation, followed by a train of serious complaints. The high price of cream of tartar tompts dishonest manufacturers to substitute alum for it in the preparation of the innumerable baking or yeast powders in the market. It is said that there are 500 different brands of powders, and 499 of these have been declared adulterations. Thus the people continue to be poisoned by mercenary merchants, while the authorities sit still and ece the work go on. In California we have what is called a State Board of Health, which is kept up at a considerable expense to the State. What good results from the commission, the public have no means of knowing. It would seem that the examination of the yeast powders in the market, and the punishment of the culprits, would properly come under its province. Let them move in the matter.—*Cal. Medico-Literary Journal.*

Effects of Turpentine on the Health.—A Frenob physician, who has studied the effects of turpentine on some 300 painters coming nnder his observation, arrives at the conclusion that the injurious effects produced by turpentine fumes can never be sufficiently severe to cause death, unless they be volatilized in an extremely confined space—that, where there are frec movement of the air and good ventilation, there need be no fear whatever of fatal accidents from this cause. He has noticed that the vapors of the turpentine coming from different sources have not at all the same energy; that of the French product, for inetance, being far less injurious than those of Hungarian or American turpentines. Again such evil effects as are produced, are, he eays, mostly in the cases of workmen unused to the trade; a very short time, however, sufficing to habituate them thoroughly to its effects. The most general form of indisposition met with among them, which may be directly attributed to the turpontine, are headache, watering of the eyes, coryza, cough, granulations on the larynx and disordered digestion.

Onions.—From our own experience, and the observation of othere, we can fully indorse the testimony of the St. Louis *Miller*, on the healthful propertics of the above esculent. Lung aud liver complaints are certainly benefited, often cured, by a free consumption of onions, either cooked or raw. Colde yield to them like magic. Don't be afraid of them. Taken at night all offense will be wanting by morning, and the good effecte will amply compensate for the trifling annoyance. Taken regularly, they greatly promote the health of the lungs and the digestive organs. An extract made by boiling down the juice of onions to a syrup, and taken as a medicine, answers the purpose very well; but fried, roasted, or boiled, onions are better. Onions are a very cheap medicine, within everybody's reach, and they are not by any means ae "bad to take" as the costly nostrums a neglect of their use may necessitate.

Surgery by the Electric Light.—Dr. Berkeley Hill, of London, recently operated for vaginal fistula in University College, while the vagina was lighted up by Coxeter's application of the glowing platinum wire. The apparatus consisted of a fine wire twisted into a knot. Through this knot was sent a continuous galvanic current, strong enough to maintain the wire at a white heat. The wire was eucloeed in a glass chamher, which was itself also enclosed in another glass cover. Through the space between the glasses, a current of water was allowed to flow, in order to preserve a low temperature aronnd the light. A strong light was maintained for over an hour, close to the margins of the fissure, without impeding the operator's manipulations.

Pie is vile, because it is indigestible, inexcusable and mysterious. It is indigestible because of the very nature of its composition; it is inexcusable because of its tampering with the holiest functions of the stomach to offer pie to it in place of food, and it is mysterious, because you don't know what you are eating. Purchased pie is the worst of all.—*W. A Hammond.*

The Week.

The past week has been in these latitudes an exceptionally pleasant one as to weather, and the sunshine has seemed doubly welcome after the long-continued storms. All the creeks and gulches are "booming" with water, much to the delight of hydraulic miners. The hydraulic mining season promises to be an exceedingly prosperous one, in view of the large storage of snow in the mountains, ensuring an abundance of water for some time to come.

Since our last issue the principal excitement and topic of conversation in this city has been the killing of Charles De Young, editor of the San Francisco *Chronicle*, by I. M. Kalloch, son of Mayor Kalloch. It was without doubt a premeditated murder, whatever the provocation may have been. The whole affair brings disgrace on San Francisco, in view of the prominent positions of all the parties concerned.

THE State School of Mines, a growing and worthy institution, has inaugurated a series of geological explorations under the direction of Prof. Lakes, a graduate of Oxford and for several years past the successful assistant of Prof. Marsh in Colorado and Wyoming. Upon the theory—and a correct one it is—that every miner is a geologist to the extent of discovering facts that make up the data of that developing science, the popular reports of these explorations, as published in the *Rocky Mountain News* and the Golden papers, will be read with interest and profit.—*Leadville Democrat.*

THE Little Chief M. Co., of Colorado, paid a dividend of 50 cents per share, amounting to $100,000, at New York, lately. This makes $300,000 paid since the company took possession of this property in January, besides defraying all expenses for dead work. The officers say that for every dollar taken out they have increased the reserve to $3.

JOSEPH SELIGMAN, the New York banker, is dead.

Arizona.—No. 1.

This Territory, though one of the most recently-acquired and even now least-known areas within the Union, is rapidly assuming great importance on account of its extraordinary mineral wealth. Early in the present century, Alexander von Humboldt wrote his belief that the district now included in Arizona and northern Sonora would prove the source of the world's future supply of silver, and his opinion is now being rapidly verified.

The vast Cordillera—the back-bone of America—which, under various names, stretches the whole length of the continent, is in Arizona broken up into short, disconnected chains, and the upper strata are eroded or absent, so that the silver-bearing lodes here crop out in full sight.

The Richness of the Mines

Was known long ago. Those Jesuit Fathers, who were the pioneers of civilization in California, established their missions in what is now southern Arizona, in the 17th century, and two of their towns still exist, one of them now the capital and the largest city in the Territory. These padres knew the richness of the country, and opened several mines, but the rude Apache was too much for them and for other Mexican adventurers, and the secrets of the mountains were tolerably well kept until within a few years.

The early American settlers in Arizona (a very few years ago makes a man an early settler there) suffered greatly from these war-like Indians, and many are the lonely graves of the pioneer miners. But little by little the fact of the existence of vast bodies of ore became known, and capital and enterprise flowed into Arizona. Eastern capitalists came, saw, and bought; English companies located there, and Californians began to wake up to the knowledge that the Comstock was not the only silver lode on the Pacific coast. The dreaded Apache was conquered by Gen. Crook and placed upon reservations; and lastly the Southern Pacific railroad made its way into the country by Fort Yuma, and is now completed to Tucson and 25 miles beyond.

Since the completion of the railroad, the growth of population and the development of the mining interests of the country have been immense, so that every month alters greatly the condition of things, towns, roads and mines starting into existence in all directions.

This new El Dorado promises yet to equal the older ones, over most of which it has some advantages. Lying to the south of Nevada, it has a more diversified surface, and in many parts more wood, water and cultivable ground. Lying north of Mexico it is not (at least in its northern portion) subjected to so intense a heat, while its elevation above the sea renders its climate generally salubrious and its atmosphere clear. The greater fertility of the country, and its proximity to the more thickly populated regions included in the Mexican Republic, cause both labor and supplies, now that the facilities for transport have improved, to be much less than in Utah, Colorado or Nevada.

Although gold and silver are at present the minerals principally sought for, copper, iron, lead, nickel, tin, quicksilver, manganese, tellurium and other metals abound here, though they have been left, comparatively, untouched, because of the inaccessibility of the country and the expense of procuring machinery to work them. Immense beds of coal are thought to exist in the plateau region, but they are not at all worked as yet. Col. R. J. Hinton gives the following as the monthly products of a few of the leading mines in 1878:

Stonewall Jackson and other mines owned by the same company	$100,000
Peck	50,000
McCracken	75,000
Signal	80,000
Tiptop	75,000
Silver King	30,000
Warsaw (Oro Blanco District)	37,000
	$447,000

The amount of bullion produced by Arizona in the year 1879 as given by Wells, Fargo & Co., is $1,942,403. While this sum is no doubt a very close approximation to the value of the bullion sent out, it must be remembered that a very large proportion of the product is not in the shape of bullion going through the hands of that company. The fact is that many of the ores of this section as taken from the mines are of so high a grade that it is found advantageous to ship them in a crude state, and that others are only reduced in weight by concentration and shipped in that form. Also much of the product of the mines is in the form of pigs, such for instance as the copper mines of Clifton, and some of the products of the mines find an eastern outlet, so that the actual yield of the Territory is very much greater than the authentic figures at hand would indicate.

Agricultural Possibilities of Arizona.

In relation to agriculture, R. J. Hinton says: "It is estimated that there are about 2,800,000 acres of land in the Territory of the best quality with surface water to sufficiently irrigate the same by reasonable expenditure on ditches; of which not over 30,000 acres are in cultivation. There are at least 10,000,000 acres, perhaps 15,000,000 to 20,000,000 of rich land that can be cultivated by means of artesian wells; such as, when thus made available, is sold in Los Angeles and San Bernardino counties, Cal., for $50 per acre and upwards, but which can at present be had in Arizona for the taking; with the difference that the average depth to water would probably not be half as great as in the counties above named. Most of this is as good fruit and grape land as the best lands in southern California. Even the deserts are not continuously sandy, barren wastes, but through and across them in various directions run extensive valleys.

"Fully half the rain falls in the hot season when it does most good, and in many localities the average annual rainfall is double that of southern California."

Fauna and Flora.

Dr. Loew, of the Wheeler Exploring expedition, thus divides, in a vertical direction, the regions of the southwest.

1. Zone of cactus, yucca and agave; altitude, 3,000 or 3,500 feet; grass, scanty; vegetation luxuriant where there is water.

2. Zone of obione and artemisia (grease wood and sage brush); altitude, 3,500 to 4,900 feet; grass, poor, with few exceptions, on granitic and volcanic soil; cacti less abundant.

3. Zone of *Juniperus occidentalis* (cedar); altitude, 4,900 to 6,800 feet; cacti few.

4. Zone of pine and fir 6,800 to 10,800. These figures give the highest limits, but descend lower on eastern and northern than on southern and western slopes.

The pinon *(Pinus edulis)*, which furnishes food to the Indians, scrub oak and live oak, occur in the juniper zone. The great Colorado forests mainly consists of *Pinus ponderosa* (yellow pine), *Pinus contorta* (tamarack and red pine), *Abies Engelmanni* (called "white pine"), *A. Menziesii* (called balsam), and *A. Douglasii.*

These woods, with those of the juniper belt, are common in the north, center and east of the Territory, and on all the river bottoms are found cotton wood, ash, walnut, mesquit, alder and cherry.

The mountain mahogany is often over 30 feet high, and two feet thick at the base; the wood hard, dark, close-grained, and susceptible of a fine polish.

Mesquit grows only on good soil, reaches a hight of 30 feet, and sometimes a thickness of two, and is excellent timber.

Recently some attention has been drawn to an insect secretion claimed to have all the properties of the famous gum-lac of India, and found upon the *Larrea Mexicana.* It is known to occur abundantly in the region between Yuma and Maricopa Wells, and in some places the insects (*A. coccus*) are so numerous that the plants are killed by the complete coating of lac, with which they surround the branches. Lac has also been found on *Acacia Greggii*, another Arizonian plant.

On the dry plains grow palo verde, grease wood, the giant cactus and several other cacti. The palo verde is a mass of evergreen branches, crossing each other at irregular angles, and growing occasionally to the size of an apple tree. Not a leaf of any kind is to be found on this tree. Where a leaf should be, there is but a rigid twig.

The giant cactus, known as the Saguara, often grows to the hight of fifty feet—mainly a stiff upright stem—the hard portion of which, consisting of a number of woody bundles set around its circumference, is often utilized in building the rude dwellings of miners or ranchmen. The "galetta," "gramma" and "sacaton" grasses are abundant and nutritious.

A great variety of birds are found in southern Arizona, partaking of Sonoran types, while in the north the fauna generally is similar to that of Utah and Nevada, including the grizzly and black bears and the wild turkey. On the so-called "desert" of the Gila bottom, and southwest Arizona generally, beasts, birds and reptiles occur in quantities surprising to one who knows the scarcity of surface water. Rabbits, hares, coyotes, chipmonks, gophers and moles abound, and all live twenty miles or more from water. Quails also (which in California always live near water) are here found distant from it. Near water mocking birds and other songsters occur, and ruby-throated humming birds suck the flowers which enliven the oases. Three species of tortoise occur, and reptiles, snakes and lizards abound, including several kinds of horned hords, the Gila monster and rattlesnakes.

Climate.

There is considerable difference between the climate of the various sections of Arizona. In the north, around Prescott, the weather has been compared to that of the Eastern States, but the cold of winter is not excessive, owing to its low latitude. Snow falls, and ice forms from December to March, although it is seldom cold enough for the former to stay long upon the ground. All travelers agree in praising the clearness of the atmosphere, the beauty of the sunrise, and the superb coloring of the sunset in southern Arizona; and all have expatiated on the wondrous mirages of the dry plains.

A rain-belt comes up from the Gulf of California and passes along the central axis of the Territory, passing from southeast to northwest, but becoming narrower as it proceeds northwards and fading out near Prescott. The rains are semi-annual, summer and winter, and the total annual fall is from twenty to twenty-four inches. Tucson is just outside of this, but the valley round about is benefited by it. Around Florence the climate, though warm, is less so than that of southern California, or that of Tucson.

The Pottery at Lincoln.

Pure clays suitable for the manufacture of a superior article of pottery are not of very common occurrence in this State. At Lincoln in Placer county, is an extensive bed of excellent clay, near which is located the California Vitrified Iron-stone Sewer-pipe Works. This manufactory commenced work some four years ago, and was established by the present proprietors, Messrs. Gladding, McBean & Co., who had previously been engaged in the same business in Ohio. At first only sewer-pipe was made, but the demand soon exceeding the capacity of the works, they were greatly enlarged and the manufacture of other classes of pottery commenced.

The clay used comes from a hill about 50 feet high one mile to the north of the works. The deposit is about 30 feet thick and extending over a considerable area is practically inexhaustible. It lies very near the surface and is immediately underlaid by a stratum of pure glass sand. Below this, and at a depth of about 75 feet beds of a poor quality of lignite or brown coal are found. The rock formation to the east, and from the decomposition of which the clay was probably formed, is granitic. Neither the glass sand nor the lignite have as yet been utilized. A quantity of the former was tested in one of the San Francisco glass factories but did not, it is said, give satisfactory results. When the pottery was established it was expected to use the brown coal for fuel. Trial, however, showed that it was lacking in both amount and intensity of heating power; its use was therefore discontinued, and oak and pine wood used instead. The dry clay has a pure white color and is perfectly free from fragments of rock. As might be expected, however, a small per cent. of oxide of iron is present and colors the baked ware. If this were eliminated chemically as is done in some European potteries, the clay would be suitable for the manufacture of table ware. Properly prepared it is a fair quality of fire clay suitable for fire brick and lining furnaces, for which purpose it is used by the San Francisco rolling mills and the Selby smelting works.

The process of manufacture is the same as that employed in the Eastern sewer-pipe works, the preparatory washing of the clay being omitted. The dry clay is pulverized in what is called the Ohio pan mill, and screened to separate the coarse particles. It is then tempered or prepared for working in tempering mills. The charge is placed in a pan eight feet in diameter, and the proper amount of water added. Two wheels with a cutting edge, and so geared as to cover the whole bottom of the pan in their revolutions, and having stirrers attached to their axle, are now run over the charge. In about twenty minutes the wheels are stopped and the clay shoveled into shallow troughs, where it is beaten with heavy wooden mallets, to drive out air bubbles and make the temper uniform. It is now ready for working up. The sewer and chimney-pipe is pressed by a steam press, the cylinder of which is 40 inches in diameter and has 48 inches stroke. A two-foot section of pipe and its flange are now pressed in one piece, an improvement made within the last few years. The elbows, curved-pipe, chimney-tops and caps, and nearly all irregular forms are molded in plaster of Paris molds or by hand. The molds for some of the large and elaborate terra-cotta vases are very complicated and quite costly. Flower pots and some descriptions of small ware are made on the potter's lathe. Nearly the entire space on both floors of the main building, which is 216 by 40, is used to air-dry the pottery preparatory to burning. Sewer-pipe is glazed with a preparation called Albany slip, which is applied by dipping or "slipping" the air-dried pipe in the solution. Four large dome-shaped kilns, arranged with a downdraft, are used to burn and vitrify the sewer-pipe. They are 8 feet high inside, and range in interior diameter from 18 to 22 feet. The flame and heat of one of these kilns, after it passes into the flue, is carried through a kiln 14 feet square, in which the terra-cotta ware is baked. Considerable fuel is saved by this improvement, which has been patented by Mr. Gladding. About ten cords of wood are required for burning a kiln of pipe, which takes about 70 hours.

Lately experiments are being made with a view to making the finest varieties of terra-cotta ware. Copies have been made of antique vases, such as are used as grounds for painting and decorating. Though only experimenting, very encouraging results have been obtained. The vases and tablets, which are baked in *seggars* to keep them from the direct action of the flame, are of a rich cream tint and quite fine in texture. Acid tubs and pipes, previously all imported, are now being successfully made.

The sewer-pipe, the main product of the pottery, has already been mentioned. In addition to its use for sewers, it is excellent for the water works of small towns, for underground irrigation, and for wagon-road culverts. Its resistance to lateral and vertical strains is very great. In road culverts it has stood very severe tests, and for that purpose is much superior to wood.

GEN. JOSEPH W. REVERE, grandson of the famous Paul Revere, and attached to the Pacific squadron which took possession of California, died last week. Revere was the officer who first raised the American flag in California north of San Francisco bay.

The Construction of Carp Ponds.

According to a promise made in a late issue of the PRESS, we devote considerable space in this number to a recital of some of the requisites in the construction of carp ponds and the details involved therein. In making this showing we shall draw chiefly from the writings of Radolph Hessel, who was engaged by the United States Fish Commission to introduce the subject in this country. It would be impossible, of course, to give items of construction to meet all needs, for some may have one style of situation and others another. It will be our purpose more to present the main requisites, and these can be adapted to meet individuals conditions. The culture of carp in this State is spreading very rapidly, and the results already attained must be taken as evidence that the growth of the fish under California conditions is very satisfactory. This being the case we are disposed to aid the movement by the publication of useful information concerning it.

Localities Adapted for Carp Ponds.

If intending to establish carp ponds, it will be necessary to ascertain the following points before the execution of the plan:

1. Is there a sufficient quantity of water at hand for all purposes, for the summer as well as winter? 2. Is the ground, soil and water favorable for culture? 3. It is important to examine the land minutely, in order to find what are the components of the soil, for not every kind of soil is suitable for carp culture. 4. It ought to be decided from the commencement how large the establishment is intended to be, whether only for private use and pleasure, or whether wholesale production of the fish as an article of trade is contemplated.

A rocky, gravelly ground is not appropriate for carp culture. Sandy ground, without a considerable mixture of loam, clay and humus, is of small use. Small ponds with a sandy bottom may be improved by supplying them with loam, as it is frequently done in agriculture.

The most favorable water will always be that which comes from rivers and brooks. Ponds might be constructed which would fill themselves with rain water during the winter or at any other time; but such water takes a moldy taste easily, which it will communicate to the fishes, as does the water from hogs also.

In Europe, experience has shown that water coming from fertile fields and meadows, carrying with it particles of offal from villages, is best adapted for carp culture. Spring water direct from the ground is not favorable, and ought to be conducted, for at least a few hundred yards, through wide, shallow ditches, in order to receive more nourishing components from the air as well as the earth, and above all, to be warmed to some extent by the sun and warm air.

Construction of the Ponds.

Ponds must not be too deep, as the water will be colder and will harbor fewer insects, larvæ, and worms, which form part of the carp's food; besides, this fish does not grow quickly in cold water. A depth of 3 feet in the center of the pond is sufficient; toward the outlet-sluice it may be from 6 to 8 feet deep, but only for an area of from 200—1,000 square feet. In the depths of this "collector," the fishes seek their resting place for the winter, and also in summer, when the water is too warm near the edge. The collector is marked *C* in the engravings. The outer part of the pond should not be deeper than 1 foot for the distance of about 70 or 100 feet, so that the water there may be warmed more thoroughly by the sun.

Toward the center of the pond, and in accordance with its size, a cavity of from 20 to 50 feet in length and 2 feet deeper than the rest of the ground should be dug. This will serve the fishes for a resting place in summer and winter. These cavities are called "kettles," and are marked *E* in the cut.

The inflow of water into the pond should never be allowed to be direct; as, for instance, a brook falling into it. This often causes the water to rise at an inopportune time, carrying into the pond other fishes, especially the rapacious pike.

The inlet sluices from the stream must of course be of a strong and practical construction, so that an overflow is impossible, and they ought to be provided with gratings to prevent other fishes from intruding.

It is an indispensable condition for the culture in ponds, according to established rules, that they be so constructed as to allow of being thoroughly drained, so that the fishes may be taken out without any difficulty.

If the size of the principal and supplementary ponds has been decided on, the hight, depth and width must be measured, and the levels of the ground and dams, if such are needed, should be carefully taken. The leveling of the bottom is required to assist in the determination of the depth of the ditches, "kettles," collector and outlet to be dug in it.

Building the Dam.

In the erection of the required dam it is most important that it be constructed of the very best material, so as to make it secure against the destructive influence of the water. It ought to be three times as wide at its base as it is high, and at the top the width should be the same as the hight. The interior or water side should be less inclined than the exterior one.

Before the foundation of the dam is laid, the ground where it is to stand must be dug out to a depth of two and a width of from four to five feet throughout the whole length of it. If the ground does not consist of loam it must be filled up with it about one foot deep, and this must be tamped down hard. A second layer follows and is disposed of in the same manner. This is repeated, the clay being moistened every time if required, and then beaten down solidly. This lower stratum is but the foundation of the dam, which is formed from the earth dug out of the pond or its vicinity. This is continued until the dam is completed. Care must be taken, however, that the construction and tamping down of this lower stratum be done in layers

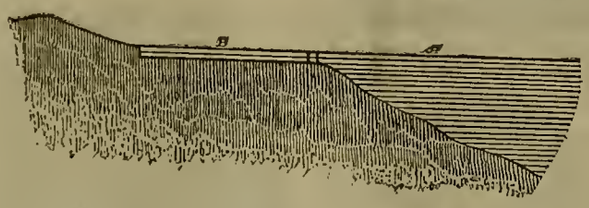

FIG. 1. CROSS-SECTION OF MIXED POND THROUGH BREEDING PLACE.

and that nothing but good clay be used. In this manner the material of the foundation will become a very tenacious mass, which will not allow any water to penetrate. The completion of this laborious task will be a source of ultimate satisfaction, as many disadvantages, which might arise after the filling of the pond, will be done away with through its agency. The dam should not be made entirely of clay, for in mid-summer, during the great heat, it would dry out too much on that side most exposed to the sun, and consequently it would become full of fissures, through which the water would escape, and this might become disastrous for the establishment.

Ponds Required.

To carry on carp culture in a regular and judicious manner, several ponds are required, according to the various purposes they are destined for.

1. The hatching pond.
2. The breeding pond.
3. The culture or regular carp pond.

The hatching pond serves more particularly for natural impregnation and hatching, or rather for natural propagation generally, by placing a number of male and female fishes in the pond. Here the females drop the eggs, during the spawning season, upon aquatic plants, where they are impregnated by the male.

The hatching pond should not be as large as the breeding-pond; its depth not to exceed 1 or 1½ feet. The outer portion, or, as it is termed, the low-water margin, should generally be from 2 to 5 inches in depth, and from 30 to 40 feet in width.

These ponds must be secured against the intrusion of pike, eels, bass, catfish, tritons, water snakes, turtles and water lizards, rats and water fowls, or any voracious animals. A fine grating will prevent the entrance of the former; against the latter, various traps are in use, and other means might be devised. It is of the highest importance that new ponds be assiduously kept clear of the animals mentioned, and of many others not named here.

Preparing Natural Ponds for Carp.

If it be desired to make use of natural ponds, it is necessary to ascertain whether they can be put into the proper condition for regular culture. This can only be done if the influx of water can be regulated and the entire drainage of the pond made possible. An intrenchment will be required with such ponds in order to make them dry. Trunks of trees should be taken out of them; and where they are too deep they should be filled up. If this is not done too many fishes will remain embedded in the mud when the pond is being drained, and this lessens the profits to a great extent.

Should any brooks fall into such ponds, as is often the case with large ones, they must be kept under strict observation on account of possible overflows which might occur. If it be practicable, the brook had best be turned off and conducted alongside the pond, when the latter can be supplied with water if required.

The fundamental rule in carp culture is that the water be of the same depth in summer and winter. If the supply of water is too plentiful, great quantities of mud are carried into the pond, embedding the grass which grows in it and on its banks; this, in consequence, will rot and poison the water. The carp immediately desert such water on account of its offensive odor, and retire from their proper feeding places to depths deficient in the production of food.

The breeding-ponds have the same construction as the hatching-ponds; they have dams, reservesluices, outlet-channels, collectors, and ditches in the bottom. The only difference is in being deeper and larger than hatching-ponds. They have an average depth of 1 foot 9 inches, and

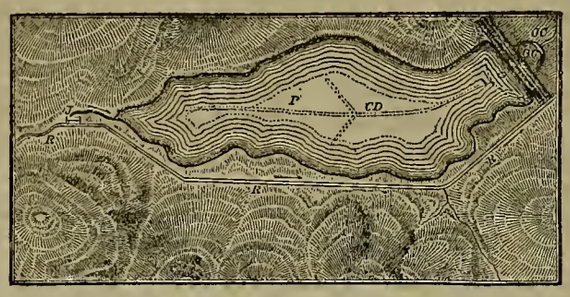

FIG. 2. PLAN OF A NATURAL CARP-POND.

the width of their shallow borders is from 70 to 80 feet. The "kettles" have a depth of 4½ feet from the surface; their borders are from 6 to 8 inches deep. The growth of grass should also be advanced in these ponds. In small ones of about 4 or 6 acres, the "kettles" may have a length and width of 60 to 70 feet.

Fig. 2 is a plan of a natural carp pond. Pond *P* is a natural body of water. Its extent is about 150 to 200 acres. It is formed by a dam, *D*, about 7 to 8 feet high, crossing the valley and thus collecting the water of a run flowing there. Before *D* is a deepening, *C*, the collector. In the dam *D*, there is an outlet leading to another deepening—the so-called outlet collector *OC*. The purpose of this collector is to

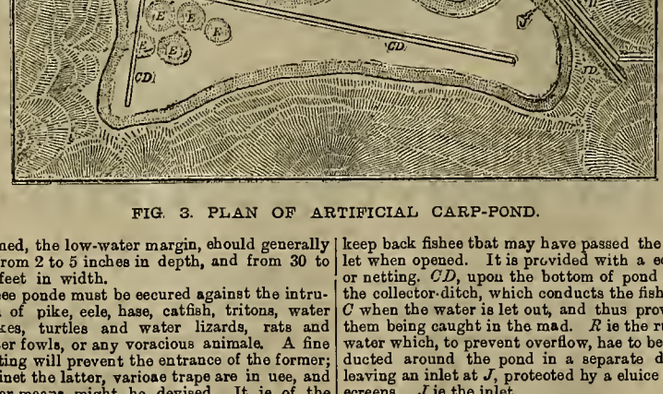

FIG. 3. PLAN OF ARTIFICIAL CARP-POND.

keep back fishes that may have passed the outlet when opened. It is provided with a screen or netting, *CD*, upon the bottom of pond *P*, in the collector-ditch, which conducts the fishes to *C* when the water is let out, and thus prevents them being caught in the mud. *R* is the run of water which, to prevent overflow, has to be conducted around the pond in a separate ditch, leaving an inlet at *J*, protected by a sluice with screens. *J* is the inlet.

Fig. 3 is a plan of an artificial carp pond. *R*, stream supplying artificial pond between undulating hills; *J*, inlet, *JD*, inlet dam; *CD*, collecting ditches; *C*, collector, *OD*, outlet dam; *O*, outlet; *OC*, outlet collector; *E*, cavities, "kettles," in which the carp collect for the winter; *H*, canal to let off surplus water in case of freshets.

As may be inferred from the above notes and diagrams, there is a great variety in the accommodations which may be provided for the carp. As we have described such as are laid down in the official reports, we shall now be glad to receive information of any especial adaptations which our readers may have made, so that those intending to try carp may have the advantage of a general recital of experiences.

Roasting Gold and Silver Ores.

Mr. Guido Kustel has just issued a new edition of his well-known work on "roasting of gold and silver ores, and the extraction of their respective metals without quicksilver." During the ten years which have elapsed since the first edition was issued, many improvements in the construction of furnaces, as well as in the methods of roasting, have been introduced. A great deal of new matter has, therefore, been introduced in the new edition, with new cuts of furnaces, etc.

Considerable space is devoted to the descriptions of the different modifications of the roasting of ore before leaching.

The "salving process" as now practiced is a very economical method for the extraction of silver. A comparatively small capital is necessary to build up such works; and hence there is a more reasonable ratio established between the amount of money which must be expended on the works and the real value of the mine than where expensive machinery is employed—a circumstance which is often a source of failure when insufficiently considered.

Mr. Kustel says: "The salving process is very simple and readily performed by common workmen. Besides the lime only brimstone must be provided, in order to prepare the necessary chemicals for salving and precipitation. It is a general, but erroneous, belief that the salving is a slow process. An amalgamating barrel is charged with 500 to 1,000 pounds of roasted ore, and treated at least six hours, and, therefore, turns out at most two tons in twenty-four hours, while a vat of proper size used in the salving process can work from four to ten tons in the same time. Only those ores are treated by this process which absolutely require roasting—a process with improved furnaces, not so expensive as formerly. The chloride ores alone can be leached directly without roasting, as thus where there is no other silver combination in them."

Mr. Kustel's new book is neatly printed and bound in serviceable covers. It is for sale by Dewey & Co., 202 Sansome street, San Francisco, for $3 per copy.

Water in Mines.

In deep mining the greatest item of expense is that of pumping. Not only is the necessary machinery very costly in the first instance, but it is expensive to run. It was principally to drain the mines that the great Sutro tunnel was run; but the water has to be raised in several instances from lower levels than that of the tunnel. At present, in the Comstock there is more water being raised than ever before. The situation in this respect is thus summarized by the *News* of the 28th:

The Union pumps at four strokes per minute, and with double columns of 14-inch plungers, 10-foot stroke, are raising not less than 921,600 gallons per day. Ophir and the C. & C. shaft are pumping also. The C. N. S. shaft yesterday lowered the water which flows to its pumps, including the recent influx from the Savage drift, 2400 level, about 13 feet. Its double column of 15-inch plungers, 8-foot stroke, are running 7 strokes per minute, and two bailing tanks of 1,100 gallons each are operated. The tanks raise to the surface, the pumps to the Sutro tunnel level. Together they raise 14,000,000 pounds of water per day, or 1,750,000 gallons. Savage pumps about 375,000 gallons and the Hale & Norcross the same. Jacket is bailing at least 240,000 gallons. The Forman shaft is raising 500,000 gallons and Belcher as much. Not taking smaller works into the account, over 5,000,000 gallons per day are raised. The Union pumps are draining the Sierra Nevada incline. The C. N. S. shaft pumps and tanks prevent work in Chollar and in the face of the drift for the Savage incline. Yesterday the sub-drain in this drift was completed and the water let into it. When it drains down, work there and in the Chollar drift will be resumed. When the Belcher can again take the water bailed by the Jacket, the Crown Point will begin connections on the 2700 level with the Jacket shaft. This means business. Belcher, like Chollar, can do nothing but pump. Compressed air cannot even be spared to resume work with on the 2760 level or to run the blowers to ventilate the workings there, which are very hot.

THE product of the Leadville mines for the 15 months ending April 1st was $16,147,131. The product of the same mines for the first quarter of 1880, included in the above figures, was $3,722,398, of which $581,788 was for lead, $11,436 for gold and $2,650,044 for silver.

New River District.

This district, situated so remote from the county seat as not often to he heard from, has nevertheless much occurring within its bonndaries that would he of interest to our readers were it only reported. Why some one of the many men located there does not take it upon himself to keep us posted on the affairs of that district we know not, hut certain it is that opportnnity is seldom afforded us otherwise to know anything of what is doing there. To Mr. J. M. B. Jones, who arrived here from New River, we are indehted for the following intelligence:

There are at present ahout 40 white men and 30 Chinese engaged in mining in the New River section and all are doing well. Among the more prominent of claims the following are especially worthy of mention: Jake Hirschberger, on the East Fork of the New river, ahout two miles ahove the store, is working alone with a hydraulic and is rewarded to the extent of eight dollars per day. The Thomas, Mill & Hardy claim, situated on main New river, hetween the Forks and Quimhy Flat, is now worked hy Noble & Mills, who make about five dollars a day ground-sluicing. John Victor & Co., a Portuguese crew of eight men, are working on Rattlesnake har, taking out $30 to $40 per day, averaging about four dollars to the man. They have been hringing in a ditch from the main stream, which will be completed hy the 1st of May and afford them greater facilities for ground sluicing hy furnishing a largely-increased supply of water. The Slide Creek mining company, on the North Fork of New river, have their mine well rigged with iron pipe and giant, and are making a good showing, a recent clean-up paying at the rate of $8 a day to the man. Sherwood & Brooks, who discovered the Blossom quartz mine, on Poney creek, last summer, have returned, and will prospect their find very thoroughly the present season, with every indication of striking a rich and permanent lode.—*Trinity Journal.*

Kendall's Spavin Cure

Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameness and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a bone spavin and completely remove the bunch without blistering.

Office U. S. Marshal, Western Dist. of Michigan, } Kalamazoo, April 15th, 1879. }

B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse restored to usefulness. Very truly yours, JOHN PARKER.

Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.

SECURE PATENTS

Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, hy reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every hranch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Hueme, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

CONTINUED FROM PAGE 277.

mining district, which has been lying dormant for several years, with but a couple of prospectors remaining at work there, is about to resume its former activity. We learn, from a very reliable source, that Felix Knight, who has been working alone in the old abandoned district of Silver Park for several years, has disposed of his mining interests at that place to Godbe & Co., of Salt Lake, for $20,000 H. Chandler has sold the old mill there to the same firm for $10,000. We understand that Messrs. Godbe & Co. have some Eastern parties interested with them and will at once go to work putting things in ship-shape and start the works. There has been a large amount of ore extracted and piled on the dumps. Silver Park is situated in the northeastern portion of Lincoln county.

ARIZONA.

GLOBE DISTRICT.—*Silver Belt*, April 24: At the Irene mill the past week work has progressed favorably; 16 men on the work, grading and masonry. The McMillen S. M. Co. have developed rich ore in the Florence mine. The Antler is producing well. When hoisting machinery, which is expected to be on the mine in 10 days, is in place, work will commence in earnest. A vein of metal was recently struck in a well 22 ft in depth which was being sunk in the rear of Hoffman's building, McMillen, that goes up into the thousands of dollars. The vein is now 2 ft in width, without the hanging wall being reached, and is evidently a spur from the Stonewall Jackson ledge. Chas. Sayre and J. S. Powers, if reports are true, have a large property on Pinto creek. From a 60-ft ledge, they have made frequent assays, going from 20 ounces the lowest, to 80 ounces, or an average of 40 ounces, which is big for such an immense body of ore. Machinery for the Golden Eagle 10-stamp mill has been passing through town during the week.

NEW GOLD MINES.—*Arizona Citizen*, April 24: We learn from Mr. Mercer, of Tubac, that a new discovery of gold leads has been made near that place. The rock looks well and quite a number of claims have been located. Near Guababi, about 17 miles west of Tubac, some recent discoveries of gold ledges have also been made, and a number of claims have been located and arastras are being put in place for the reduction of the ore, which is said to go $40 to the ton.

OUTSIDE CAMPS.—Cor. *Arizona Citizen*, April 24: I will now go outside of Tombstone proper, and speak of some of the camps near by. Quite recently there has been an excitement about gold quartz near Antelope springs, at the south end of Dragoon mountains. I have not been there, but am told there is a belt about 2½ miles in length through which run a series of veins that crop out with iron-stained quartz, and all carry gold. I am told upon reliable authority that some of the quartz will assay over $1,000 per ton in gold, and that the ore at a depth of 10 to 15 ft will average from $100 to $300 per ton. Mr. Kinkner, from New Jersey, has a company who are interested in the camp, and are well pleased with their prospects. Other parts of the Dragoon mountains are exciting considerable attention, as the assays begin to run up. Some of the claims were of exceedingly low grade at first, but grew better as the shafts went down. Some assays on new mines have exceeded $1,000 per ton, and strikes are reported almost daily.

GOLD FOR ALL.—*Arizona Miner*, April 23: Col. Moreland, the discoverer of the Tiger and many other of our best mines, arrived to-day, from Tonto Basin, where he has discovered the richest and most extensive gold diggings in the Territory. He has taken as high as $1.50 from a single pan of dirt. We are told that these diggings are 15 miles in length and considerable in width. We will interview the Colonel and try to give our readers his opinion to the premises.

PATAGONIA DISTRICT.—The ground in the vicinity of the old Mowry mill is being pretty thoroughly prospected, and several promising prospects have been discovered during the past month. The Mowry mine is thought to be a very valuable property; the average assay is not of high grade, but it is very easily worked. The main shaft on this mine is down 320 ft, and a large amount of ore has been taken from it, which was reduced at the old smelters of this place. The average yield of the ore for the first 200 ft was $40 in silver and from 25% to 40% lead. A large deposit was struck at a depth of about 250 ft which smelted from $60 to $300 per ton. Notwithstanding the many disadvantages under which the mine was worked it was made to pay.

DAKOTA.

BLACK HILLS NEWS.—*Times*, April, 22: Allen, Carlan & Co. have commenced their bedrock flume, operating in Deadwood gulch, and are working day and night shifts. The great drawback at present seems to be a lack of water, there not being half enough running in the gulch. Star & Bullock, Buckley, Williams and Rawsou are bringing in water on their claims. Nos. 13, 14 and 15, below on Deadwood, and expect to start their sluice in about 2 weeks. Drifting has commenced on claim No. 22 below, and we understand good pay is being taken out. The Caledonia 60-stamp and the Terra 30-stamp mills were running again yesterday.

LEXINGTON MINS.—This mine is in Spruce gulch, and is destined to be one of the bonanzas, but not until there are different arrangements made. When this mine was discovered the owners were poor men, and were not able to develop it on scientific principles as wealthy corporations do, but on the contrary, had to go ahead in the cheapest manner possible. A 10-stamp mill was procured and started, and has milled considerable ore with the most encouraging results, and now comes another calamity. Yesterday the mine caved in, but happily with no loss of life. The mine was developed by a perpendicular shaft, and at a depth of 50 ft the ore body, which we believe to be a true fissure vein, was struck and passed through; and after going down 50 ft further and finding no ore body, they ceased going down, and at the footwall of the ledge built a platform across the shaft, and started in stoping out the ledge, the ore being hoisted out by a hand windlas. The miners had drifted back on the ledge 25 to 30 ft, and about half as wide, and the full thickness of the vein about 15 ft. Yesterday the roof gave way, probably from not being properly timbered, and the whole thing came down. A tunnel will be driven in on this 50 level and the whole thing properly timbered and protected, and in a short time the Lexington will be in good shape.

IDAHO.

YANKEE FORK ITEMS.—*Herald*, April 15: Another rich strike was made Saturday last on Mount Custer. The quartz is as rich as anything yet found on the hill, ruby silver showing plentifully through much of the rock. The location was claimed by different parties, but a compromise has been effected. From the present indications there will be some very important developments brought to light on Custer this spring, and with the mines already opened and proven on the mount, the out-put of ore in the near future must give the Yankee Fork mines still further fame for quality and quantity. Operations are necessarily limited, yet the developments on the Lucky Boy mine are very satisfactory. Shaft No. 1 has reached a depth of 16 ft, showing a well-defined vein full width of the shaft; 3 ft of which is worth $350 per ton, the balance being fine milling ore. A new shaft (No. 2) has been started 180 ft east of No. 1, and though only a few ft down a body of ore has been struck almost as rich as that found in No. 1. The present showing makes this one of the most valuable mines in the district. Capt. Low is pushing the work, and will put on an additional force right away.

NEW MEXICO.

ITEMS.—*Arizona Citizen*, April 24: Experimenta are being made on the dry placer washings near Silver City. A party of Eastern railroad magnates have been junketing through the Territory. A rich placer mine is reported to have been discovered near the Bourbon, Cerillos district, from which a test pan is said to have yielded 35 cents. Las Vegas is quite certain that her Hot springs are unsurpassed. The Little Maud mine, about 2 miles east of Silver City, has been sold for $5,000, cash.

UTAH.

MINING ITEMS.—Salt Lake *Tribune*, April 22: Considerable mining property in the several mining districts of Beaver county are changing hands. Work on most of the old claims in Star district is to be resumed. The Milford furnace is being got ready preparatory to a fresh start. New strikes are being reported every day in Frisco district.

SILVER CLIFF DISTRICT.—*Prospect*, April 20: The Leviathan, between here and Rosita, has been sold to Cincinnati parties for $16,000, cash. There are now about 6,000 tons of ore on the dumps at the Bassick. The company is arraoging to erect a concentrator to be in operation by July. The Silver Cliff smelting company started up their furnaces yesterday. Messrs. Keath and Slosson yesterday bonded the Leopard lode, 12 miles northeast of town, for $10,000. The shaft is filled with rose spar and white quartz; at the bottom the mineral is much the same character as that found in the Diregо and Ben Franklin. At the depth of 95 ft, in the Lady Franklin, the ore is improving greatly. The Silver Cliff company's mill, during the past month, has milled about $35,000 worth of ore. Yesterday the Silver Cliff mining and milling company commenced operating their new tramway, running from the Racine Boy to the stamp mill. They have 3 cars on track, and will add 3 more as soon as they can get them here. When their train is completed it will convey 60 tons of ore to the mill daily. The ore they are now taking out averages about $50 in silver to the ton.

EL DORADO DISTRICT.—Silver Cliff *Prospect*, April 20: Mr. M. M. Giles, of the El Dorado mining district, paid the *Prospect* a pleasant call last evening. He is in high spirits over the prospects of his camp, and is confident that it has a future of unstinted prosperity before it. He is owner of the Alamosa, from which mine he has had assays running as high as $540. The main shaft is down 40 ft and has penetrated a 10-ft vein of decomposed matter carrying free gold in paying quantities, which can be sluiced out. Mr. Giles came over to the Cliff to procure lumber for sluice boxes, sieves and other things necessary for sluicing out the gold. He has been in the El Dorado district 5 years, and seems thoroughly conversant with the mineral formations of the Sangre de Cristo range.

News in Brief.

GOVERNOR FREMONT, of Arizona, is in New York.

PROF. NORDENSKJOLD has arrived at Stockholm, Sweden.

E. B. FRENCH, second Auditor of the Treasury, is dead.

THE Marquis of Ripon will succsed Lord Lytton as Viceroy of India.

A PARTY of Boston excursionists, numbering 100, have arrived in this city.

SEVERAL chiefs in Afghanistan favor an immediate attack upon the British.

THE output of bullion from Tybo for the month of March was $17,470.

THE annnal report of Gold Hill shows that the assessed property is $1,765,401.

THE salmon catch in the Columbia river has been very light so far this season.

A DOZEN Chinese are about to apply for naturalization to the New York courts.

ONE of the authors of the Winter Palace explosion at St. Petersburg has been arrested.

THE loss of stock in British Columbia from the severe winter will not be as great as anticipated.

THE United States frigate *Constellation*, with provisions for the suffering Irish, has arrived at Queenstown.

ANOTHER revolution in Port-an-Prince has been nipped in the bud by the imprisonment of the leader.

THE Governor has signed the McClure charter, an important measure for the citizens of San Francisco.

EXCITEMENT still prevails in Shasta county over the silver discoveries on McGee & Camden's iron mountain.

FRIGHTFUL wind-storms occurred in Wisconsin, Illinois, Kansas and Arkansas last week, doing immense damage.

JOHN H. BURKE has commenced another suit at San Francisco against the bonanza firm—this time to recover $10,429,000.

THE importation of neat cattle and swine into Canada from the United States has been prohibited by the Privy Council.

THE Pennsylvania legislative bribsrs have been sentenced to $1,000 fine each, and a year at hard labor in the Penitentiary.

CHINESE cruisers have captured some vessels in Portuguese waters, and a Portuguese vessel has been ordered to Macao, to investigate.

ACTUAL measurement shows that during the whole winter 441 inches of snow had fallen at Emigrant Gap and 522 at the Summit. At Truckee there has been about 300.

THE California pan mill and battery, says the Gold Hill *News*, are reducing 320 tons per day. The Bonanza mines are yielding this ore at the rate of 270 tons per day.

JOHN F. SWIFT, the California member of the new Chinese Commission, has arrived at Washington and has had interviews with Secretary of State Evarts, and President Hayes.

THE deepest vertical shaft on the Comstock is the Yellow Jacket, which has attained a depth of 2,936 feet, and which is being timbered and sunk at the rate of 27 feet per week.

THE Palace Hotel is having a boom. It is said that there are now over 1,200 guests in that house. There is probably no other hotel in the world containing so large a nnmber of guests.

REPRESENTATIVE PACHECO has introduced a bill in Congress to donate the military reservation at Camp Independence to Mono and Inyo counties for the purpose of establishing a High school.

FORTY THOUSAND pounds of hoisting and other machinery, for the San Antonio S. M. Co., Belmont, have just arrived at Wadsworth, from the foundry and machine works of Beckett & McDowell, Arlington, N. J.

FREDERICK VON BODERSTEDT, who is now Germany's most celebrated poet, will arrive in San Francisco in a few days. He is making a tour of America, and will visit the Germans of San Francisco for two or three weeks.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co, Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING APRIL 20TH, 1880.

226,705.—PLOW—L. Brown, Waitsburg, W. T.
226,712.—PREPARING BEANS, ETC., FOR FOOD—Wm. Butts, Petaluma, Cal.
226,653.—HITCHING HORSES—O. Dunkel, Eureka, Nev.
226,622.—TRACING WHEEL—D. W. Moody, S. F.
226,774.—SAW—E. Neuman, S. F.
226,678.—SAFETY POCKET—J. Rosenetock, Elko, Nev.
226,629.—BUCKLE—J. Rotherbucher, Virginia City, Nev.
226,679.—FIRE ARM—A. Schneider, S. F.
226,686.—SCRAPER—L. A. Sweatt, Santa Clara, Cal.
226,804.—CAN FOR BAKING POWDER—J. S. Taylor, S. F.

NOTS.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest ratee. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

HITCHING HORSES.—Oscar Dunkel, Eureka, Nevada. Patented April 20, 1880. No. 226,653. The object of this invention is to provide a device by means of which horses will be prevented from running away, either when left standing or in motion. It consists of a lever attached to the bed or body of the vehicle, and so connected with the single-tree and the horses' bits, that when left standing, in case the horses move ahead, their motion will operate the lever and draw their heads apart or together, thus checking them. Then when they back in obedience to the check they receive, the pull will be relieved. In driving the ordinary lines or reins are used; but in case of the horses attempting to run the driver can draw on the check rein, which is used with the lever, and may thus draw the horses' heads to either side and stop their onward progress, and this without reference to the driving reins. This device will effectually prevent horses running away. It is the work of a moment to attach the prevention rein to the lever when the driver wishes to leave the horses, and the moment they begin to move ahead enough to tighten their traces, they check themselves back by drawing on the lever and line. There will be no tendency to back too far, since as soon as their traces are slack again, the strain on their mouths is immediately relieved.

TRACING WHEEL.—Daniel W. Moody, S. F. Patented April 20, 1880. No. 226,622. The use of what are known as "tracing wheels," for the purpose of marking or tracing thin patterns upon a surface of cloth or other material, is common, these wheels consisting of a single star, having sharp points, and turning upon an axle properly supported in a frame, with a handle for convenience. When a pattern has been traced by this wheel it is necessary to mark out a line for cutting, which must be at such a distance from the pattern-line as will insure sufficient material to form the seam. This is either done in an irregular manner, without measurement, or sometimes by careful measurements at frequent intervals, and marking to indicate the points and guide the cutter. The invention consists in the employment of two parallel-toothed or star wheels, supported within a suitable bed or frame upon axles which are continuous or in line, so that when one wheel is made to traverse the desired pattern the other will form a line upon which the goods are to be cut, so as to give the necessary width for the seam.

WHEELED SCRAPER.—Leroy A. Sweatt, Santa Clara, Cal. Patented April 20, 1880. No. 226,686. This invention relates to certain improvements in scraping and grading machines; and it consists in suspending under suitable framing mounted on wheels an adjustable scraper so regulated and adjusted by means of levers that while scraping its rear end may be raised so as to bring it to any desired angle, and that when filled its front end may be raised so as to lift it, with a load, entirely off the ground. When in this position it may be carried suspended between the wheels to any desired point, where, by still farther raising the rear end, the contents of the scraper may be dumped. By this construction a convenient device is provided for leveling and scraping, and which also serves for conveying quantities of earth, etc., away from one point to another, and dumping it where required.

CULTIVATOR.—David M. Johnston, Red Bluff, Cal. Patented April 6, 1880. No. 226,321. This invention relates to certain improvements in cultivators, and consists in certain details of construction whereby choking and clogging of the teeth, when cultivating land that has a heavy stubble or undergrowth, are prevented. This cultivator is very light and, at the same time, strong and durable. The sections are made of wrought iron, and of heavy or light material, according to the land upon which the cultivator is to be used.

PREPARING BEANS, PEASE, ETC., FOR FOOD.—William Butts, San Francisco, Cal. Patented April 20, 1880. No. 226,712. The object of this invention is the preparation of those descriptions of vegetable alimentary substances which are gathered and stored in a dry state, such as beans, pease, lentils, etc., in order to preserve them unchanged in their nature for an indefinite period, and to render them at the same time available for use without the necessity of consuming much time or fuel in preparing for the table. The vegetables are obtained when in a dry state and soaked for a short time in clean water, after which they are placed in a close chamber into which steam is introduced. When sufficiently steamed they are placed in a drying chamber where they are kiln-dried, the water being removed by evaporation. When dried in this way, they are ready for market.

EVERY new subscriber who does not receive the paper, and every old subscriber not credited on the label, within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect ourselves and subscribers against the acts and mistakes of others.

Nothing short of Unmistakable Benefits

Conferred upon tens of thousands of sufferers could originate and maintain the reputation which AYER'S SARSAPARILLA enjoys. It is a compound of the best vegetable alterativee, with the Iodides of Potassium and Iron, and is the most effectual of all remedies for scrofulous, mercurial or blood disorders. Uniformly successful and certain in its remedial effects, it produces rapid and complete cures of Scrofula, Sores, Boils, Humore, Pimples, Eruptions, Skin Diseases and all disorders arising from impurity of the blood. By its invigorating effects it always relieves and often cures Liver Complaints, Female Weaknesses and Irregularities, and is a potent renewer of vitality. For purifying the blood it has no equal. It tones up the system, restores and preserves the health, and imparts vigor and energy. For forty years it has been in extensive use, and is to-day the most available medicine or the euffering sick anywbere.

FOR SALE BY ALL DEALERS.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruber's great Educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

SAMPLE COPIES.—Occasionally we send copies of this paper to persons who we believe would be benefited by subscribing for it, or willing to assist us in extending its circulation. We call the attention of such to our prospectus and terms of subscription, and request that they circulate the copy sent.

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Atlanta Mining Company.—Location of principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, 420 Montgomery St.: San Francisco, Cal.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, April 29th, 1880, and day of sale to Monday, May 24th, 1880. By order of the Board of Directors. A. F. McGREW, Sec'y.

Office—Room 7, No. 420 Montgomery Street, San Francisco, California.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 41), levied on the Eighth day of March, 1880, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. of Certificate.	No. Shares.	Amt.

And in accordance with law and an order of the Board of Directors made on the eighth day of March, 1880, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, room 8, No. 402 Front street, San Francisco, California, on Monday, the third day of May, 1880, at the hour of one o'clock P. M. of such day, to pay delinquent assessments thereon, together with costs of advertising and expenses of the sale. W. O. WILSON, Secretary.

Office—No. 402 Front street, room 8, San Francisco California.

Palmer Ice and Refrigerating Company.—Location of principal place of business, San Francisco, California. Location of works, 224 Fremont street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of April, 1880, an assessment (No. 2) of $5 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, No. 303 Montgomery street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 24th day of May, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 17th day of June, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. C. C. PALMER, Secretary.

Office—No. 303 Montgomery St., San Francisco, Cal.

ANNUAL MEETING.

The Annual Meeting of the stockholders of the Original Gold Hill Gold & Silver Mining Company, for the election of a Board of Trustees to serve for the ensuing year and, also, for the transaction of such other business as may properly come before it, will be held on Monday, the Tenth (10th) day of May, 1880, at the hour of 2 P. M., at the office of the Company, Room 4, 300 California street, San Francisco, California. Transfer books closed on Friday, the Thirtieth (30th) day of April, 1880.

J. M. BUFFINGTON, Secretary.

Office, Room 4, 300 California, St., San Francisoc, Cal.

ANNUAL MEETING.

San Francisco Copper Mining Company.

The Annual Meeting of the stockholders of the above named Company, for the election of Trustees to serve for the ensuing year, and the transaction of such other business as may come before the meeting, will be held on MONDAY, the third day of May, 1880, at the hour of three o'clock, P. M., at the office of the Company, 258 Market street (up stairs), San Francisco, Cal.

P. SANCHEZ,
Secretary.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company,

Nevada Block, Room No. 37, San Francisco, April 15, 1880. At a meeting of the Board of Directors of the above named Company, held this day, a Dividend (No. 54) of Fifty Cents (50c) per share was declared, payable on TUESDAY, April 20, 1880. Transfer books closed until 21st instant.

P. JACOBUS,
Ass't Secretary.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and hand Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 36 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed

Owing to an increase of nearly 100% in number of pages and Illustrations since first projected, the price is this date made $2.50, postage paid

ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia.

March 10 1880.

Entirely different from other Saws. When dull, sharp teeth, which only cost a trifle, can be inserted in a few minutes, without taking the saw off of the mandrel, and no skill is required in doing it. Send for Catalogue showing their vast superiority. More of them are being sold than of any other kind, and we are altering all other kinds to the Chisel Tooth.

TATUM & BOWEN,

329 Market Street, 3 Fremont Street.

Notice! Important to Miners!

An important Machine called the

DRY GOLD SEPARATOR

Has been invented and can be seen at No. 5 Beale St., S. F. Arrangements have been made to manufacture in quantities to suit the demand. Machines weigh from 200 to 300 lbs. Price, $30 to $150. They run 10 to 20 tons of gold-bearing earth through per day, thoroughly separating the precious metals from the earth. Several are at work in Arizona and Mexico. A guarantee with each machine. Call and see sample at No. 5 Beale street, near Market, San Francisco.

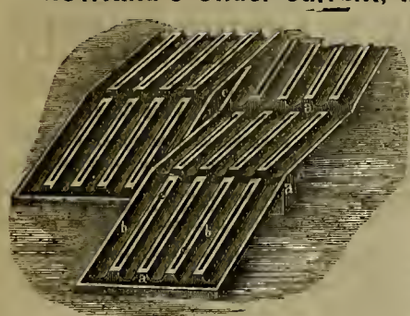
Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

Rotary Pulverizer,

(WHITE'S IMPROVED,)

For Disintegrating Ores and Other Substances.

GUARANTEED TO BE EQUAL IN CAPACITY TO A

HUNDRED STAMP BATTERY!

IS FITTED UP WITH

Homogeneous Steel Beater Bars.

Found to be more durable than either Hard Steel or Soft Iron. Dry-crushing the hardest rock; will last for months, and without the slightest danger of breakage.

The Pulverizer requires about one-third the power usually expended for the reduction of the same amount of Ore by Stamps.

Price List, Etc., of the White Rotary Pulverizer.

No.	Tons Per Hour.	Inches Diameter.	Revolutions Per Minute.	Horse Power Required.	Shipping Weight.	Lumber Required.	Price.
1	6	56	600	40	12	6,000 ft.	$5,000
2	10	72	470	60	15	9,000 "	8,000
3	16	84	400	75	20	12,000 "	10,000

The Repairs on the Pulverizer will not exceed those of a 10-Stamp Battery.

The Shipping Weight of the entire apparatus is not one-eighth of that of Stamp-Mortars required to do an equal amount of work. ☞ It can be placed and put running at the Mill in from fifteen to twenty days.

Address GEO. W. WHITE, Inventor.

Manufactured exclusively at the ÆTNA IRON WORKS, 217 Fremont St.

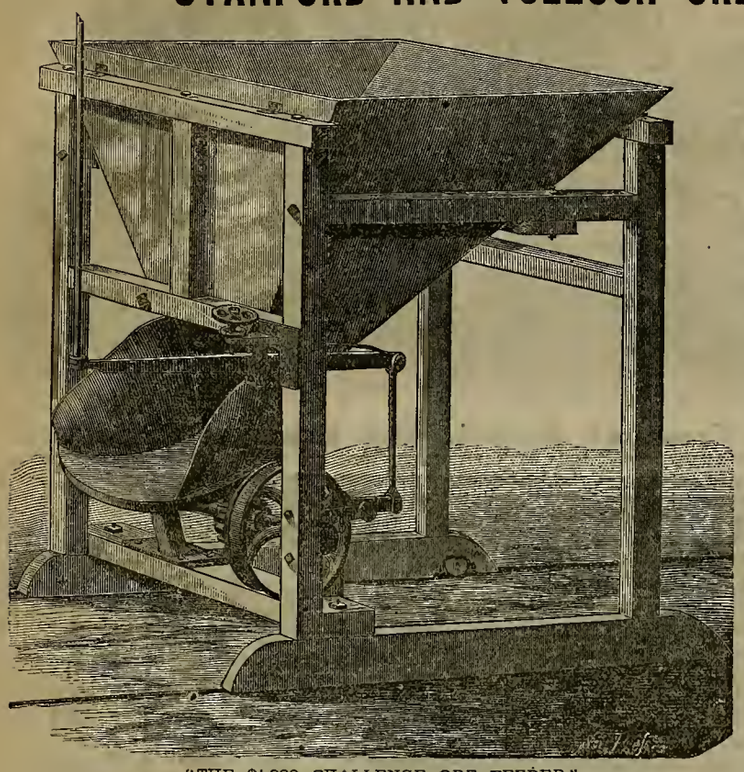
The $1,000 Challenge Ore Feeder

AT REDUCED RATES.

—ALSO THE—

STANFORD AND TULLOCH ORE FEEDERS.



"THE $1,000 CHALLENGE ORE FEEDER."

Several Hundred of the Famoue

CHALLENGE ORE FEEDERS,

Are in use in many mills on this coast, and wherever used give great satisfaction.

The STANFORD Feeder, made by me, has superseded the Victor Ore Feeders, furnished by E. T. Steen, in the Alexander mill, J. B. Cooper, President, office, Safe Deposit Building, S. F. By special permission I am enabled to refer interested parties to Mr Cooper.

In this connection I will state that I will give $50 to be shown up to this date one of the Eclipse Ore Feeders, manufactured by Prescott, Scott & Co., of the Union Iron Works, which is in general successful practical operation at any quartz mill on this coast.

I have made a specialty of manufacturing ORE FEEDERS, and know which will give satisfaction for steady work. The Improved

STANFORD FEEDER

Will beat any one in use—always excepting the CHALLENGE, which is THE BEST OF ALL.

By use of CHALLENGE ORE FEEDER there is 15 per cent. less wear and tear of iron than by hand feeding. There is also 20 per cent. more ore crushed.

I make at my works

The Challenge

AND THE

HENDY ROCK BREAKERS.

The CHALLENGE is the best rock breaker at work today. The HENDY is the newest thing in this line, and is worthy of close examination by all mill men. Call and see it.

BANDMANN, NIELSEN & CO.,

SAN FRANCISCO, CAL.

VULCAN BLASTING POWDER.

The Strongest, Safest, Most Uniform and Reliable "HIGH EXPLOSIVE" Manufactured on the Coast.

MINERS TESTIFY THAT IT IS FREE FROM OBJECTIONABLE FUMES.

We call the attention of all desiring such a Powder to our various grades, which are prepared to sell at LOWEST RATES.

No. 1.—Equalling Liquid Nitro-Glycerine in Strength. We recommend this Grade in extremely hard rock, boulders, iron, etc.

No. 2.—Will do the work thoroughly in all but the hardest kinds of rock.

No. 3.—For bench work, pipe-clay, soft and shelly rock, outside work and quarrying.

Single and Triple Force Caps, Fuse of all Grades, Vulcan Powder Thawing Boxes, Batteries and Exploders, For Sale at the Lowest Rates.

VULCAN POWDER COMPANY,

Office, 218 California Street, - - - - - SAN FRANCISCO, CAL

PATENT

LIFE-SAVING RESPIRATOR

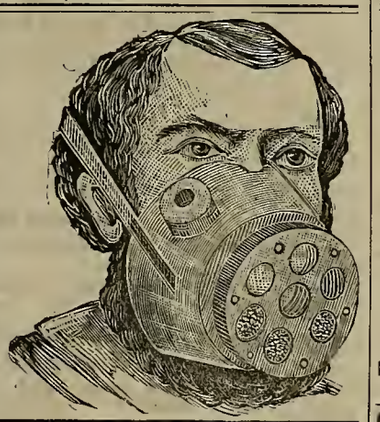
Prevents Lead Poisoning and Salivation.

INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

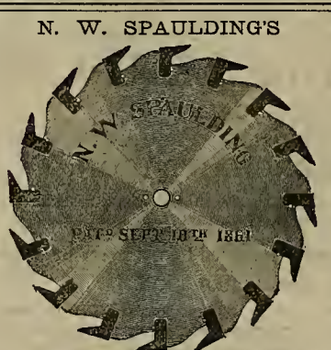
SETH MARSHALL, Jr., Agent,

309 California Street, San Francisco, Cal.

Send for Descriptive Circulars containing testimonials of well-known parties who are at present using them.



N. W. SPAULDING'S



PATENT DETACHABLE TOOTH SAWS,

Manufactory, 17 & 19 Fremont St., S. F.

HOOVER TELEPHONES.

Sent to any part of the Pacific Coast O. O. D. for

$10 per Set

With full instructions for putting up lines. Send for Circular. Room 21, No. 323 Montgomery Street, San Francisco, California.

PACIFIC MINING AGENCY,

ALMARIN B. PAUL, Principal.

Will give attention to the purchase and sale of mines of *developed merit*. Purchase and sale of mining machinery. Examination of mine and mill properties. The disposing of ores at best market rates. Also, the overcoming of all difficulties connected with saving the precious metals—in fine, all business connected with mining and mining companies.

Address ALMARIN B. PAUL,

Room 20, Safe Deposit Building, San Francisco

Testimonials as to the perfect working of the Concentrator to be seen at the office.

The FRUE ORE CONCENTRATOR.

Adams & Carter, Agents.

Some Evils from which we are Exempt in California.

Doubtless there has been much written about California of an extravagent and sensational kind. That parties having land to sell, or being otherwise interested in promoting immigration have sometimes unduly magnified her natural advantages admits of no question, while tourists, traveling through the country at their ease, enjoying the best and seeing the bright side of everything, have, as might be expected, been voluble in her praise. But notwithstanding these too glowing accounts and occasional Munchhausenisms, there really is much in California that commends it as a place of permanent residence, especially to those with whom health and comfort are prime consideration. We have here our disadvantages and drawbacks arising from climatic and other natural causes. We suffer at times from severe droughts and local floods, and now and then from winters protracted and rigorous like the past. But these are attended with but little loss, and trifling inconvenience compared with the evils, varied and multiplied, that afflict our neighbors east of the Rocky mountains, and indeed most communities elsewhere, the world over. If we have drought they occur only at long intervals, and never extend over more than a portion of the State, the effective measures that are being adopted to insure extensive irrigation, operating to restrict every year more and more the area of country exposed to suffer from this cause. The damage arising from floods is inconsiderable, and even our severest winters cause but little loss or suffering, snow being a thing almost unknown throughout all the more densely populated parts of the State, our navigable streams never being obstructed by ice, and but comparatively little stock ever perishing from starvation or cold, though much the greater portion is never housed or foddered. The winter over, there ensues here a long season of warm and stormless weather during which neither man nor beast is likely to suffer much from cold, hunger or want in any form. It is a halcyon-like period covering some seven or eight months of calm and sunny days, free from blighting frosts, burricanes, and we may add destructive earthquakes as well, since viewed in the light of results, these may be classed among our most harmless phenomena. More lives were destroyed by the cyclone that swept over a Missouri village a week or two since than by all the earthquakes that have occurred in California since its first settlement over 100 years ago. Being never harmed by lightning we are free from that other and greater pest, the lightning-rod agent. Plagues and widespread epidemics in none of their forms ever trouble us.

How different with the people of the Western and Atlantic States! Their winters are terrible—almost arctic—and when over they have but brief respite from other meteorological troubles. The spring brings its cold drizzly rains, the summer its sun-strokes, thunder showers and fatal lightning, and the autumn its premature frosts and early snows, preludes to another long and dreary winter. The heat of summer is oppressive and debilitating, while the winter cold drives all in doors, to the great detriment of health, as well as business. The yellow fever desolates the cities of the South, while cholera in some form lurks in the cities of the North—disease and discomfort being every where the rule during the hot months of summer. From hurricanes they are never free, these happening whenever it suits their "own sweet will." The whole year seems, in fact, but a mournful procession of fresh evils, tribulations and sorrows, treading so closely on the heels of each other that the unhappy victim barely gets rid of one when another is upon him.

Now, we hold that it is worth something to live in a country free, or measurably free, from calamities and annoyances of this kind, and herein California offers inducements for settlement by people who appreciate exemption from this class of physical evils.

That this State offers other special attractions is also true, though these have been so often alluded to and so thoroughly advertised that we need not now expatiate upon them. A few words concerning our freedom from the bad climatic conditions above mentioned seem, however, opportune at a time when the whole world is suffering from frost, famine, pestilence and tornadoes, and so many strangers are flocking to our shores with the purpose of making here their future homes.

An Important Patent Suit Decided.

The "rivet" suit of Levi Strauss & Co., of this city, against H. W. King & Co., Chicago, for infringement of a patent for protecting the pocket-opening of garments from ripping, by means of rivets, has been decided in favor of Levi Strauss & Co. The action has been pending since 1876, and has been vigorously contested. Over 400 witnesses have been examined—from California, Idaho, Montana, Colorado, Minnesota, New York, Pennsylvania, and, in fact, from almost every part of the United States. The contesting parties have each spent upwards of $50,000 in the litigation. The testimony occupies 3,500 pages of fine type, and the argument of Mr. M. A. Wheaton, of this city, who managed the case for Strauss & Co., alone took 300 printed pages.

The patent thus sustained was originally taken out for Strauss & Co. by Dewey & Co., of the MINING AND SCIENTIFIC PRESS Patent Agency, and its standing the severe tests of the courts is a gratification to us. The patent was a very important and valuable one. The riveted overalls made under it are well known all over this coast among mechanics, farmers, and miners. In the decision, the court overrules the alleged defences, sustains the novelty and patentability of the inventions, holds the defendants to be infringers, and orders a decree against them for a perpetual injunction and damages.

THE House Committee on Commerce have agreed to insert in the River and Harbor Appropriation bill an item of $10,000 for commencing the improvement of the San Joaquin river. Page is endeavoring to obtain their consent to making it $20,000, which is almost all that could be advantageously used during the working season, but his efforts are impeded by the fact that Engineer Stewart's recommendation for this improvement is weak, having been made, it is understood, only under pressure brought to bear by Page's letter, asking that he be replaced by some engineer officer not unfavorable to this particular improvement.

THERE are about 37 men working in the El Dorado canyon mines, near Pioche.

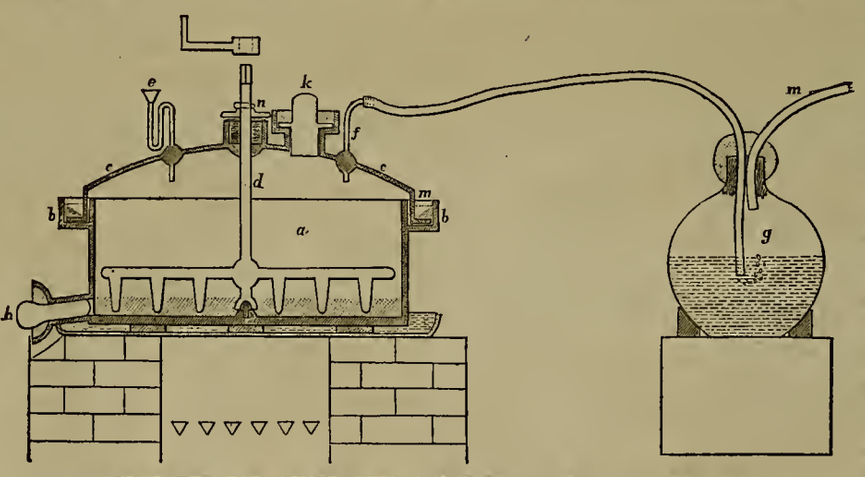
Production of Chlorine Gas for Gold Chlorination.

We take from "Roasting of Gold and Silver Ores," Mr. Kustel's new work, an engraving representing the appliance used for the production of chlorine gas, for use in works for the extraction of gold by chlorination.

The circular tub, *a*, has on the outside a circular ring, *b*, two and a half inches deep and two inches wide, for the reception of the flange of the cover, *c*. The cover is provided with a center hole for the reception of the stirrer, *d*, with a leaden pipe, *e*, bent in the shape of a letter ω, through which the sulphuric acid is introduced; another pipe, *f*, conveys the gas to the washing apparatus, *g*. At the bottom of the gas generator is an opening, *h*, for the discharge of the residue, and *k* serves for introducing the charge.

The cover is placed over the generator, the edge of the flange luted with clay, as shown by *m*, all around, and then filled with water, as indicated by the dotted line. The space at *n*, round the stem of the stirrer, must be filled with packing of cotton cloth strips saturated with oil, and the outlet, *k*, closed with a wooden plug wrapped, like the stuff-box, in cotton cloth, wrapped solid plug of lead, as above described, and luted with clay. The generator is placed in a square piece of boiler iron, the edges of which are bent up two or three inches to hold water or prepared for steam. The sulphuric acid is now introduced through the pipe, *e*, but not the whole amount at once; about 12 pounds to begin with will answer to create sufficient head to develop the gas, which escapes through *f* into the carboy, *g*, to be washed from acids. The gas should bubble through the water very lively; if not, the stirrer should be turned, and if this fails to produce the required effect, more sulphuric acid must be introduced, and repeated as often as the bubbling appears to become less active, always using the stirrer first. After all the sulphuric acid has been used up, the fire must be started till the water below the generator commences to boil. It takes about four hours to develop all the chlorine gas.

The rubber hose from the pipe, *f*, (⅜-inch hose), after being oiled inside, is inserted into the carboy one or two inches below the water; the other hose, *m*, conveys the gas to the chlorinating vat. Both rubber pipes in the neck of the carboy are wrapped in oiled cotton cloth, and all the space around packed tight with oiled rags, then covered with putty, as shown in the drawing. There is no necessity to change the water in the carboy often—once a month will do. The water through which the gas passes absorbs, if cold, about two and a half times its volume of gas, and is then saturated, but is still good for taking up muriatic acid.



APPARATUS FOR GENERATING GAS FOR CHLORINATION PROCESS.

The washing of the gas, to get rid of the small quantity of muriatic acid, is not so important, since, if a portion of this should happen to enter the ore, and, forming sulphureted hydrogen, precipitate metallic gold of that already chloridized, this would again be converted into a chloride in presence of abundant chlorine; but the washing is an indispensable indicator of the progress in the generator, by the more or less lively bubbling. Care must be taken to turn the stirrer from time to time, while the water round the generator is boiling, to prevent the caking of the ingredients.

If there is only one chlorinating vat, the gas from the carboy can be conveyed through one hose direct into the vat below the filtering bottom; but if there are several of those, it is better to fix a lead (¾-inch) along the vats, connected with those half-inch pipes before each vat, to which a piece of hose is attached. If not in use, the hose is withdrawn from under the filter, and closed with a stopper.

After the hose, *d*, has been inserted under the false bottom, the gas enters the space and rises slowly through the ore, until it reaches the cover, and commences to escape through the pipe, *i*. This is easily detected by the smell; but it frequently happens that although the smell denotes the escape of gas, it is sometimes difficult to find the point where it escapes. Ammonia, in contact with the smallest quantity of chlorine, forms a white fume, and it is the best medium to examine all connections therewith to find the escape of gas. If, in the generator, little gas is still emitted, this may continue; also, if all outlets in the chlorinating vat are closed. After this, water is admitted into the generator through the pipe, *f*, to fill up the space inside and to displace the gas. The plug, *h*, is then removed, and the residue discharged into a closed trough. In case the roasting is not properly done, it takes several pounds more of manganese, and the other materials in proportion, as well as more time for impregnation.

"Roasting of Gold and Silver Ores" is for sale by Dewey & Co., 202 Sansome street; price, $3.

THE sheft of the Dayton Gravel M. Co., at the mouth of Gold Camp, is now down to bedrock, about 24 feet. Work has been suspended until a pump can be put in. There is a four-foot streak of gravel which averages over 20 cents to the pan.

THE trail to the Skagit mines, via Hope, is said to be clear of snow.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

[Correspondence of the PRESS.]

Mining on the Klamath—A Long and Rigorous Winter.

While we have had here along the Lower Klamath a winter of great length and unprecedented ssverity, it has not proved so detrimental to mining, our leading industry, as has bsen the case in most other parts of the State. It will generally be inferred that, because of our position so far north, we have here a rigorous winter climate; and so we have on the mountains, which cover seven-eighths of the face of the county. But the lower portions of the valleys of the Klamath and Trinity rivers hsing depressed almost to sea level and not very far distant from the ocean, enjoy a comparatively moderate winter climate, the suow never accumulating hers heyond a few inches, sometimes not so much as half a foot falling during the whole winter. This year we have had, however, over a foot of enow at this place, the weather meantime heing so cold that the water was frozen in the ditches, preventing hydraulic washing for nearly two months, a thing that never hefore occurred in this locality. Nearly every winter thie husiness is intermitted for a few weeks, usually in December or January, hecause of the discomfort of working during the cold rains, but not often, as has happened this year, on account of the ditches becoming obstructed with snow or freezing up altogether. For several weeks past hoth hydraulic and sluice washing have heen under full headway, and notwithstanding they have lost so much time, our miners count on making up for it in good part through an unusually abundant and prolonged water supply.

Extent and Character of Our Mining Operations.

Placer mining on the Klamath and its lower tributaries covers a linear extent of over 200 miles, reaching on the main stream from a point 20 miles ahove this place down almost to the ocean, a distance of 120 miles, and along Scott's river and the Salmon some 50 or 60 miles, some little work being also done on the smaller hranches of these several streams. We have here almost every form of placer mining—hydraulic, river-hed, hand and ground sluicing and some limited drift operations, much of the gold being now taken out hy the hydraulic method, carried on principally along the main river. The heaviest river-bed operations are on Scott's Fork, with Hamhurg Bar for their center. This description of mining has in that neighhorhood heen in progress for 25 years or more, having been continued from season to season, and heen prosecuted on a more extensive scale than at any other point in the State. Here can be seen great mounds of houlders piled up 50 or 60 feet high with pits excavated to hedrock, often 40 or 50 feet deep and hundreds of feet long. Thése pits are kept dry by huge pumps operated by undershot wheels set in the river opposite. Powerful derricks, used to hoist the massive boulders, swing them around and pile them up, creak here all the night long; operations never being for a moment suspended during the working season, which at hest is short and very uncertain, heing always terminatcd by the arrival of winter and sometimes hy untimely rains occurring hefore the advent of the regular wet season, and which, suddenly raising the river, floods the pits and sweeps away the derricks, wheels, tools and sluices of the hopeful miner just as he is about to realize some reward for his considerable investment and arduous labor.

The pits mentioned are sometimes sunk immediately over the suhterranean gold-bearing channels and reaching down to them, the latter are worked through these excavations. At other times the pits are sunk at the sides of these channels, which latter are then reached by tunnels through which their contents are brought out into the pits and then hoisted or in wheelbarrows brought to the eurface, where they are washed in sluices. The tailings after slacking, through exposure to the air for a year or two, are again put through the sluices, and pay well for rewashing.

Hand sluicing is, in this section of country, widely in use, hcing practiced hy the Chinese (here very numerous) almost exclusively. Drift digging, as before remarked, is not much in vogue. Of vein mining we have but little carried on immediately along the main rivers, the sites of this business heing on their various confuents, or in the valleys further back in the mountains.

The Principal Hydraulic Mines

In this vicinity consist of the Bailey ground, lying on the Klamath, thirteen miles ahove this place. The gravel here is rich, and the facilities for working it, so far as outlet and water supply are concerned, very superior. The claim is, however, but poorly fitted up, and has heen worked hut little, the owner finding more delectation in hunting than mining. In other hands the property could, with comparatively little outlay, he made to yield large net revenues. One and a half mile below the Bailey ground, Woods & Cramp are running 1,000 inches of water on a fine hank of gravel, and making big wages. One mile further down a company are piping and taking out a good deal of gold. They run 2,000 inches of water, taken from Thompson's creek, a large northerly confluent of the Klamath. Some eight or ten miles helow this point the Wingate and the Bunker Hill companies are each opsrating a prosperous hydraulic mine. Right at this place the Ferguson & Frazier company are running three giants and doing extremely well, their gravel heing of high grade, easily washed, and their mines equipped in the hest possihle manner. One mile ahove Happy Camp, lying on the opposite side of the river, is the Del Norte, or Richardson mine, also well opsned and outfitted, and producing gold dust at a rats that indicates for the property a large value. Here again, the yearly production made, amounting to some fifty or sixty thousaud dollars, could with a small outlay bs nearly doubled; but the owner is content with what he gets, preferring to lst a gang of Chinamen run his mins and pocket half the proceeds, while he gratifies his penchant for mechanical inventions, an occupation of which he is immoderately fond. As the fruits of this study, there are to he seen on these premises divers and sundry curious devicss, all ingenious and some very useful. Among other of these contrivances is a whsel, which, revolving in the bulk-head, carries on its periphery all the leavss, sticks and other ruhhish, floating on the water in the ditch and discharges them outside, thereby preventing their entering the flume, and being carried down into and obstructing the pipes. .This wheel acts perpetually, and performs a service, without being looked after, that would require thc attention of a man daily. Some improvements effected in the gravel-washing and gold-saving apparatus employed here are equally clever and even more useful, as they increase production while working an economy of hoth time and lahor. In short, our miner is a mechanical genius and bound to indulge his hent in that direction, even at the hazard of beiug plundered hy his Mongolian employees.

A Modern Icarius—A Flying Machine and What Came of it.

Dr. Degroot, while here last fall examiniug some of our hydraulic mines, related an incident that, occurring in his own experience, well illustrates the fonduess of our good-natured neighbor up at Del Norte for mechanical pursuits, showing at the same time that an inordinate indulgence of these tastes is with him no new thing. The Doctor, it seems, was eome years ago sitting alone one day in the editorial rooms of one of the leading newspapers of San Francisco, when there entered a hroad-shouldered young fellow with a pleasant, manly face, who, in a hesitating sort of way, inquired: "Be you the editor?" Thinking, from his appearence, the stranger might he a miner from the mountains, the Doctor replied: "Well, not exactly, though I sometimes grind out a little matter for the mining department of the paper—got some items in that line?" "Well, no, not exactly in that line, but I can *fly!*" "Ah! I see an angel, and a pretty robust one, too; but where are your wings?" "Well, they'r down ou the machiue—gulls' wings—ahout 50 pairs of them, dried and wired on." "Ah! that's it; you've constructed a flying machine—eh?" "Yes, that's it, and I thought of taking it out tomorrow and making a trial of it. Would like to have some of you newspaper men go 'long and see how she performs; if good, then you might say something about it. If she don't go off right, why then I guess the less said about it the hetter."

Having thus explained the ohject of his visit and obtaiued the Doctor's consent to go with him early the next morning and witness a first trial of his ærial apparatus, Richardson, for he it was, suggested that it would perhaps he as well for the "Editor," if at leisure, to go down and take a look at his invention beforehaud. This being assented to, they twain took their departure and, proceeding to a dilapidated building standing on the south side of Jackson street, between Front and Battery, entered and, ascending a flight of stairs, passed through a hall and down a ladder at its further end into a vacant rear room. Here Richardson, pausing, explained that he had adopted this method of ingress and egress as a means of preveuting anyone seeing what was going on in the huildiug; adding, that he had thus far kept his invention a secret and wished to so preserve it until he had made a practical trial of its merits. This over, Richardson opened the well-secured door and ushered his guest into a capacious, rough-hoarded apartment, that had long served the purpose of a carpenter shop.

Here, occupyiug a good share of the otherwise empty space, stood, stood the handi-work of the stout young man; one of those things that once seen, is not to he forgotten. A framework, 18 feet long, 6 feet wide and 6 feet high, had heen constructed of bamhoo sticks firmly wired together. Extending along and on each side of this structure were rows of gulls' wings, attached in pairs to slender hamhoo poles, one row ahove and one below. These wings, which had heen dried with such care as to preserve their natural shape, were, by an ingenious and complicated gearing, so arranged that they could he made to flap in concert, the upper rows being worked hy the hand and the lower hy the feet of the operator acting on treadles.

Having pointed out with much volubility, how man when essaying locomotion in a new element should imitate nature, employing the wing of the bird if he wishes to fly, copying the movements of the aquatic fowl if he desires to swim, pattsrning after the snout of the swine whsn he would root, etc., the builder of this outre contrivance got him into the harness and working his arms and legs vigorously, produced a fluttering and din like a myriad wild geese put to sndden flight. This over, the two separated with the understanding that they were to meet at the same place early the following morning when the machine was to he subjected to a more crucial test, the inventor having already employed men to carry it out to a suitable spot fixed on for the purpose.

At pssp of next morning all were on hand, and the end of the huilding having besn removed the four stout Irishmen provided for the work, took hold, one at each corner of the ark-like structure, and started with it on a trot up ths middle of ths street, Richardson urging them the while to quicken their pace that they might get outside the town before there were many people astir to observe them. The place selected for the experiment was a steep hluff, overlooking the hay in the vicinity of Black Point, its sides covered with hrush and its hase close to the water. By the time the procession had reachsd this spot it was broad daylight, and the people living in the scattered cottages near hy, having caught sight of the well-plumed frame work which doubtless they mistook for a new style of hearse, hsgan to peer at the party through the windows, some coming out and staring at them in a way not at all pleasing to the principal actor in the husiness, who lost no time in getting into the machine as soon as it was set down on the edge of the hluff. The assistants were hurried to their places, one at each corner, and instructed to give the thing a boust when all was in readiness.

Now the adventurer in this flighty enterprise having counted much on assistance from the wind in hie first efforts to mount from the earth, was pleased to find it hlowing briskly at the time; and having waited a little for it to freshen up, when a pretty stiff hreeze came swecping hy, helieving the opportune moment had arrived, sang out "Hoist away, all hands! Good-bye hoys till I see you again, for there's no telling where I may light;" whereat the quartet of Hihernians lifted sturdily, each at his corner, while the aeronaut floppsd the entire set of wings with all his might. Under these combined efforts up wcnt the machine with its precions freight, ascending steadily until it had reached a hight of some 40 or 50 fcet, when a sudden gust of wind getting under the concern, turned it up side down, so reversing the order of things that the occupant's fcet were brought into position where his head onght to be. That he was not spilled out entirely and dropped to the earth in advance of the less pouderous mechanism was due to his limbs becoming entangled in the wreck, hy which he was saved from a more hasty descent. In good time, however, the whole establishment reached *terra firma*, alighting on the side of the bluff, down which it rolled crashing through the hrush in a confused mass to the hottom. The assistants and some others who had hy this time gathered on the hrow of the hill, having good reason to helieve the aeronaut killed outright, remained for the moment awe-stricken and silent, and, not till Dr. Degroot, hurrying down had found the young man hut little hurt, did the crowd ahove give vent to the feeling which such a ludicrous scene was calculated to inspire. Richardson, who was not seriously injured, though badly scratched and nearly stripped of his clothing, comprehending the situation, cried out to the doctor as he approached, "For God's sake cut away these traps and get me out of this as quick as possihle." This done the two seized hold of the wreck and dragging it to the water's edge threw it in, leaving it to he hy the receding tide horue away, while they, keeping out of sight under the hluff, hastened hack to town; Richardson, satisfied that the results reached, if they did not wholly upset his theory, were at least of a negative kind, and the Irishmen on the hluff satisfied that they knew exactly where the aerial navigator had alighted.

This incident, Dr. Degroot had, according to promise, kept to himself until he came up here fast fall, when Richardson, who with lapse of time had grown less sensitive on the suhject, himself alluded to it in a jocular way, removing the injunction to further secrecy. Should this account of the affair find a place in your columns it will he the first time it has ever appeared in print or in any way attained publicity, though it douhtless occurred as ahove related, or as nearly so as I can now recall the circumstances as given hy the narrator. X. Y. Z.

ANOTHER JOINT SHAFT.—The Mackey gold and silver mining company and the Essex gold and silver mining company have filed for record an agreement to sink a joint shaft at Cedar hill, near the Phil Sheridan works. The Mackey agrees "to commence forthwith the sinking of the said shaft, and to carry on said work with all reasonahle dispatch for the period of one year, and to furnish and advance all money that may be needed to carry on and prosecute said work at its own cost, and to furnish and do all things necessary thereto." The Essex agrees "that it will during the said period leave the control and management of the said work entirely to the said Mackey company, and upon demand at the expiration of one year from this date reimhurse one-half of all costs so incurred and moneys expended." The shaft is to be the joint property of the two companies, and to he used in common hy them for the development of their respective claims.—*Gold Hill News.*

Gold Hill.

A Chat with One Who has been There.

A Silver Cliff *Prospect* reporter, while on an excursion for news, met Mr. S. Wallace, who was in charge of a stamp mill at the ahove named place, during the greater part of last summsr. After introducing himself, the news fiend set his rsportorial smeltsr to work, and at the end of the "run" cleaned up the following budget of facts concerning the Gold Hill camp. This camp lies at the mouth of the canyon through which the limpid watsrs of the classio Cottonwood break from their mountain confines into the San Luis valley, and was located some four years ago. Shortly after its location a mill for treating its gold-bearing rock was erected and rnn for some time, hut proved a failure. From rock assaying way up in the thirties, not more than $10 psr ton could be extracted hy this mill, and the pioneer prospsctors and minsrs became sorsly discouragsd and gradually drifted away to other and more promising fields, till ths camp was almost deserted. About one year ago, however, new prospectors entered the forsaken field, and gave the place new life and activity. New discoveries were made, new mines opened, and the old mill was set in mqtion again, by Mr. Wallace and others, hnt somehow or other they could not induce the mill to extract mors than $10 worth of the coveted metal from a ton of ore. It was emphatically a $10 mill, and after running it during the summer, Mr. Wallace left it to rest and rot under the touch of time. But this time the failure of the mill did not discourage the mine owners, and they still hold to their property, and cling to the belief that a world of solid wealth lies entombed in the mass of gold-hearing rock of that vicinity. They were convinced hy assays that their ore will yield gold in paying quantities, as soon as the proper treatment can he discovered, and the necessary machinery he introduced in the camp. Col. Carter, of Philadelphia, has undertaken to supply this want, and will, Mr. Wallace thinks, first try what is known as the Walker, or Lightning process, and in the evcnt of this proving un-uccessful he will make special adaptations to the ore. The contract for the lumher to be used in the construction of this mill has heen let and a saw mill has been erected especially for the purposc of getting out this lumher.

The principal mines of the camp are Bonanza, Hidden Treasure, Alamosa, Eastern Star, Great Wonder, Hematite, Saxon, Christone and Ohio. Three or four of these have been worked all winter. A numher of assays from these mines have, says Mr. Wallace, run as high as $40 to the ton in gold, and one assay went as high as $600 to the ton, hut Mr. Wallace was frank enough to say he did not consider ore of such value superahundant in the camp.

A mill run of ore from three mines, one at Gold Hill and two at Christone creek, five miles from the former place, has just heen completed at this place, and ran respectively two, three and five ounces in gold to the ton. A load of ore containing 2,500 lbs. and brought over from Gold Hill some time since, is reported to have sold for $200, but how much truth there is in the report we are not prepared to say.

The camp is easy of access from Alamosa, the road running along the San Luis valley all the way. The distance is 40 miles, and from the latter city the camp drawe the larger portion of its supplies.

In point of altitude Gold Hill is about on a level with Silver Cliff, and has a good climate. There is an ahundance of pinon pine for fuel within a convenient distance of the camp, and a good supply of light spruce suitable for lumher.

KING CARBONATE.—With the mining people East, carhonate-producing mines are in greatest favor. One correspondent complains that no other class of mines stands any show. This all comes of the fact, of course, that the Eastern people have acquired all of their notions of mining from Leadville. On the same ecore Eureka should he immensely popular heyond the Missouri river. We have here the richest and most extensive carbonate deposits that have ever heen brought to light in any part of the world. But the Eastern public is wrong in restricting purchases to carhonate properties. There are other classes of mines equally productive and permanent, and fully as desirahle. *Eureka Sentinel.*

INSECT LOCOMOTION.—M. G. Carlet, of France, has heen studying the locomotion of insects and arachnids, and reports as the result of his ohservations that the walking of insects may he represented hy that of three men in Indian file, the foremost and hindmost of whom keep step with each other, while the middle one walks in the alternate step. The walking of arachnids is represented hy four men in file, the even-numhered ones walking in one step, while the odd-numhered ones walk in the alternate step.

ROTARY STEAM ENGINE.—An Indiana exchange thinks that the prohlem of cheap steam power has heen solved hy a couple of ingenious mechanics of Windfall, Ind., who have invented and patented a ncw rotary steam engine, which is said to he a marvel of simplicity and power. A ten-horse power engine of this pattern has heen manufactured and put in operation. It is said to occupy less than a cuhic yard of space, and weighs 350 pounds. The net cost of construction, with very inadequate facilities, was $90.

MECHANICAL PROGRESS.

Furrowing at the Joints of Steam Boilers.

Probably the most important practical inference to be draws from the tests of the strength of rivsted joints, is the explanation which they furnish of the failure, hitherto unexplained, of boiler-plates, not at the joints, but in their neighborhood. It is well kuown that some process knowu as electric or galvanic actimn produces pitting and furrowing from copper oxides, derived either from the copper feed-pipes or the brass tubes, and held in solution, the oxide acting with acids or salts would produce the furrowing.

In Sonth America and the West Indies the atmospheric influences have a very intense destructive action on boilsr-plates; the tube-sheets of some of the engines, after running only a few ysars, conld be dug into holes with tho nail. Thie action is known in the marine boiler hy the pitting nver the furnace tops, owing to the action of the feed water from the surface condensers. The old jet condensers had the blame of wasting the fuel, but the surface condensers certainly wasted the plate. One reason of this may be that the water does not contain snfficient salt ae to dsposit a scale sufficiently thick to prevont the action of tho oxides held in eolution.

Tho brass tubes of snrface condensers and boilers, if of brass, shonld be tinned before heing fitted intn the boiler. However, it is well known that boilors, whether stationary, locomotives, or marine, fail by corrosion aud other agencies pitting and furrowing the surface of the iron. This pitting nf the metal ie readily explained hy the presence of metallic oxidss or salte held in solution in the water, and by the known inequality of mstal, nnequal expansion, etc., whereby the iron is gradually weakened, separated and diseolved; and probably a weak galvanic current may be established between the iron ehell and the brass tubes, thus hastening the powers nf destruction. But this does not meet the case of a straight furrow along a seam, cut like a groove along the surface. Furrows are eithsr parallel and close to a joint, or concentric and close to a flange, such as that of the feed-pipe, scum or blow-off. In no case are they found at sny notable distance from a seam, joint, or flange, or otherwise than parallel to thsm. The inference that a relationship exists between the parts mentionsd and the furrowing of the plats is strengthened by the fact that, as the groove or furrow is not found in welded shells, and the differential expansion of the seams heing douhle that of any other part of the plate, unequal cooling aud heating when getting np steam and blowing-off, produces an unequal tension and a relaxation of the joints, attended with distortion, bending and unbending of the plates on each side of the joint, the consequencs being that the metsl is gradually weaksned in lines parallel to the seam, and is thns exposed to corrosive actien. On this theory, the furrowing having first established a weak place, the corresive action being concentrated thsre, would suffice to extend and deepen tbe groove thue formed to dangerous limits, occasionally producing explosions. Any echems that will lessen these dreadful catastrephes should be adopted by every one taking part in the bnilding or management of a boiler. A welded steel shell would be entirely free from fnrrowing, as it would be frse from inequality of distrihution of metal. Thoss who are familiar with boiler explosions will have observed that the plate always rips along a ssam, and parallsl to it.

The weakness attendant on lap-joints is strikingly exemplified in the lap-welded seam, when enbjected to extreme tension, though the metal at the weld is perfectly solid, and fully as etrong in itself as the body of the plate In this cass, there is no elementary weakness iu the reduction of metal by rivet-holes; and the inferiority of strength arises solely from the bending of the plates on both sides of ths lap, and the over-straining of the fire-box in the endeavor to attain a position of stahility. The cause of furrowing may therefore be said to be a mechanical, and that of pitting a chemical one. Mr. John Sewell, in commenting on the corresion of locomotive boilers, ascribes the furrowing of plates at riveted seams to the interruption of the vibrations nf the boiler by these seams, the localization of the fatigue at these places, and resulting increased eusceptibility to corrosive action.* This action has, douhtless, a tendency to aggravate the evil of lap-jointing; but we are disposed to ascribe the evil to the lateral hending and unhending of the plates as the primary canss.

The furrowing of lap-jointed plates teaches an important lesson on ;the practical value of direct connection by means of butts, or butt-welds, in exerting, transmitting, or resisting forces.

That tbe furrowing of the plates at the riveted joints results from the inclination of the strain, is rendered still more probable by the analagous furrowing which results from reciprocating strsins of another kind. In the older classes of engines, in which the cylinders were fixed to and worked from tho smoke-box plates, the alternate forward and hackward movements and strain producsd by the steam-pressure on the piston havs been known to wsaken and subject to corrosion and leakago the substance of the plate along the edge of angle-iron at the junction with the barrsl. Mr. Cnlburn states that he is not aware that any accidents from furrowing of boiler-pletes have taken place in the United States; and this no doubt arises from the use of vsry thin boiler-plates, not more than one-quarter to five-sixteenth inch thick. Steel nf this thickness butt-welded would carry twice tbe pressure, and would bo entirely free from the vice nf furrowing; the mechanicsl and chsmical properties of such a boiler would be homogensous, assuming, of cnurss, that the tubes, stays, and evory part are of steel.—*Universal Engineer.*

* "As riveted points destroy the elastic homogeneousness of the boiler, the waves of expansion, contraction and vibration are arrested at the seams by the greater rigidity of the riveted double thickness of metal, which tends to localize the fatigue sustained by the iron near these joints, and it also appears to increase the susceptibility to corrosive action, since the furrows take the line of fatigue, and are often deeper than the spots on the plates." Report of Board of Trade on Railway Accidents, 1855, page 49.

Annealing in Boiling Water.

An English expert on motal working, Prof. W. Mattieu Williams, says: "I will narrate eoms curious experiments that I commenced when in Sheffield, but have not setisfactorily compksted. They were made at the suggestion of Mr. William Bragge, then a managing director of Sir John Brown'e works. He had learned that the stesl wire springs of pianofortee are annealed by what appears a very ominous process, viz., by making tbe wire red hot and then plunging it into boiling water. Ordinary experience would euggest that this mnst harden the eteel in some degrse, hut I tried it upon many samples of eteel—mild Bessemsr eteel, shear steel of different qualities, and the herdest old-fashioned Sheffield 'pot steel'—and found that in every case, when the operation was properly performed, the steel was remarkably annealed. I compsred samples cnt from the same bar—one heated and slowly coolsd by hnrying in ashes under a furnace grate, the other by immsrsion in boiling water—and found that when subjected to bending tests, those which had been cooled in boiling water would bear a more severe degree of flexure without cracking than the pieces which had been more slowly cooled in the ashee. They were not so soft, as tested by the touch of the file, but unquestionably tougher and more reliable when subjected while cold to violent bending blows of a hammer. It was more effectual than any device of 'oil-toughening' or slow cooling I have had opportunities of testing.

"Certain precautions are necessary. In the first place, the water should be quite at ths boiling point and the stsel at a bright red heat; and, secondly, the steel should be fairly surrounded by the water. The conditions heing fulfilled, the steel remains red hot under water for some time. It is evidently surrounded by a film of vapor, aod is not in actual contact with ths water, which assumes the so-called 'spheroidal state,' continuing in this condition until the metal has cooled considerably. I snspect that the toughening is due to the uniformity of cooling thus effected."

Horse-Shoeing.

As there have been many theeries in shoeing horses for the benefit of tho horse and its owner, which have not proved satisfactory in all cases, I will give you the result of my sxperience in horse-shoeing for the last 30 yeare:

First notice the way the horse stands. If his feet are stretched forward it denotes that the ehoes hear too much at the heel. Remsdy: Pare the foot considerably at ths toe, hut very little at the heel. Joint the foot, after it is pared, with the rasp, and see that you havs an equal bearing all around the foot. Have the shoe concaved back to ths last hole in the shee; then level back to ths heel calks. Whsn the shoe is set, have tho crust at the heel about midway of the width eide of the shoe. Commsnce nailing at the toe, one nail on each sids alternately.

Second: If his toes incline toward each other, set the ehoes pointing straight forward and trim the toe on the inside, which will prevent his hittiog the other foet and stumbling. Shees in all cases should be of good length. Work and eam horses, in eummer time, should be well calked half sharp.

Third: To prevent overreaching, longer shoes are necessary on the forward feet. The outsido corner at the heel should bs rounded out to prevent chafing the hind foot. Set the shoe on the hind foot back so that the foot may project over the shoe nearly half an inch at the toe. You will tben be rid of that painful and disagreeable ttune at every step, click, click, click.

For roadstcrs, in summer time, I prefer the slipper shoe, thick at the heel, with medium size toe calk. To prevent interfering, pare the foot a little, the mest on the outside. This will have a tendency to roll the ankles furtber apart. A side calk on the outside heel will prevent the feot sliding under as it touches the ground. Set the shoe pointing etraight forward with the foot projecting over the shoe as in other cases.—*Cor. Blacksmith and Wheelwright.*

Overheating Steel.—It is sometimes said in regard to overheating steel, that too frequent heating with high heat extracts the carbon, thus rendering it somewhat like iron. In regard to this matter a correspondent of the *Manufacturer and Builder* eays: "What we call burnt steel has just as much carhon in it as the steel that has not been hurnt. This was proved by experimente made upon samples which were analyzsd by Prof. Albert R. Leeds, of Stsvens Institute. He fonnd that ths amount of carbon in a piece nf steel which had bean purposely burnt was the same as in a similar piece which had not been burnsd. The burning, howsver, was of ths steel itself, which contained a lsrge amonnt nf oxide of iron, that is, the metal instead of the carbon burned. The heat does net harm steel or iron, and tbey may he hoated and cooled an unlimited number of times, provided they are not allowed to come in contact with the air, and so take up oxygsn. In heating a piece of eteel, the amount of blast has much more to do with the burning than the heat. If tho extra amount of oxygen which a burnt piece of steel has taken up is taken out of it, it can be mede to work just as well as it did before. Tho proof that the heat does not harm steel is fonnd in the fact that if steel is put in a closed box, and luted up so as to keep out the air, it can be heated and cooled an unlimited nnmber of times without injury."

Tarring ropes, it has been shown, slightly diminishes thsir tenacity against a pulling strain—but maintains a high average of tenacity much longer than an untarred one, by reason of the protection the tar affords against atmoepheric and other causes of deterioration. The quantity of tar found most euitable is about 15% of tbe weight of the ropo.

SCIENTIFIC PROGRESS.

The Latest Investigations in Regard to the Sun.

The great csntral orb of our system hae of late been made the subject of much epecial study. Investigations with improved apparatns and hy improvsd mcthods have been especially directed to probleme relating to its distance and mass, its temperature and constitution, and ths nature of its appendages of chromosphere and corona. Prof. C. A. Young, the distinguished American astronomer, gives an account of the most important of these invcstigations, from which we summarize as follows:—

The recent correction of the value of the solar parallex, deduced from the late transit of Venus, is a matter of much importance. Euck's figures which place the sun at 95,000,000 miles from tbs earth, have remained unquestioned for about forty years, or until ths late observations were worked out, reducing the mean distance to 93,100,000 miles.

Tho investigations next in intercst are those which deal with the solar temperaturs, concerning which the most diverse opinions existed until lately among men of science, as may he inferred from tbe etatement that scientists differ in opinion all the way from millions to the comparatively low temperature of 3,632 F. The most generally received figures are thoee of Prof. Rosetti, of Padua, who, after a series of careful and interesting investigations, places the sun's temperature at about 18,000 F.

Passing to the subject of the constitution of the eun, the eminent American astronomer, Prof. Young, alludes to Dr. Henry Draper's recent discovery of oxygen in the solar atmosphere as being the first discovery of the sxistence of a non-metallic element there. He looked forward to such improvements of photographic methods, in the near futnrs, as would lead to the discovery of other non-metallic elements in the solar atmosphere, tbe absence (non-discovery?) of which has been quite puzzling to astronomers. To Prof. Lockyer's hypothesis of the composite nature of the non-metallic elemcuts, and his infersnce that they could not exist undecomposed in the intsnse heat of the sun, Prof. Young made casual references, but did not commit himself as a believer. He referred to ths eclipse observations in 1878 as having establishcd the fact that an intimats connection exists between the state of the sun's surface and ths condition of the corona; while on the interesting question of a connection between the snn-spots and terrestrial meteorology he appears to be undecided, save that he regards as established a connection hetween the sun-spot period and the magnetic etate of the earth.

Electro-Horticulture.—In confirmation of the recent experimente in electro-horticulture by Dr. C. W. Seimens, which were noticed at length in the Press of April 17th, the *Scientific American* remarks as follows: "It has often been remarked by Arctic explorers that plants which require several months to ripen their fruit in temperate climates, complete the same round of budding, blooming and maturing in a few weeks under the continuous sunshine of the Arctic summer. A corresponding rapidity of growth is shown by annuals in sub-Arctic latitudes, as in northern Norway, where the summer suu, though never reaching a high altitude, yet remaine above the horizon from 16 to 20 hours a day. A species of corn which flourishes in Canada failed to ripen in Kentucky, though the warm season there is some weeks longer than in Canada. The euperior rapidity with which vegetation pushes forward during periods of full moon and light nights has also been widely noticed; these facts of general observation, with others of a more experimental character, going to show that many of the plants of our temperate climate thrive in proportion to the duration of the daily (direct or indirect) sunshine they enjoy, rather than according to the temperature of the air."

Science not Atheistic.

"I hsve refsrred to Cudworth's discussion of thsories of matter witb regard to the possible atheistic tsndsncies of soms of thsm; and the time has not gone by, psrhaps it never will, when the fear nf atheism, as growing out of physical theories, will have ceased to exist. I am by no means prepared to say that there is no ground for such fsar; hut I think that some portion at least of the danger of science boing found to have atheistic tendencies would be got rid of, if a clearer view could he obtained of the manner in which it is possible to estahlish a connection between physical theories and atheistic conclusions. It sesms to me that we want a new word to express the fact that all physical science, properly so called, is compslled by its very nature to take no account of the being of God: ae eoon as it does tbis, it trenches upon theology, and ceases to he physical science. If I might coin a word, I should say that sciencs was *atheous*, and therefore could not be *atheistic;* that is to eay, its investigations and reasonings are by agreement conversant simply with ohsserved facts and conclusions drawn from them, and in thie sense it is *atheous*, or without recognition of God. And, because it is eo, it does not in any way trsnch upon *theism* or *theology*, and cannot be *atheistic*, or in the condition of denying the being of God. Take tbe case of physical astronomy. To the mathematician the mechanice of the heavens are in no way different from tbe mechanics of a clock. It is true that the clock mnst have had a maker; but the mathematician, who investigatee any problem connected with its mochanism, has nothing to do with him as euch. The spring, the wheels, the escapement, and the rest of the works are all in their proper places somehow, and it mattere nothing to the mathematician how they came there. As a mathematician the investigator of clock-motion takee no account of the existence of clockmakers; but he does not *deny* their existence; he has no hostile feeling toward them; he may be on the very best of tsrms with many of them; it may be at the request of one of them who has invented some nsw movement that he has undertaken his investigations. Precisely in the same way the man who investigates the mechanice of the heavens finds a complicated eyetem of motion, a numbsr of bodies mutually attracting each othsr and moving according to certain assumed laws. In working out the results of his assumed laws, the mathematician hae no reason to consider how the bodies came to hc as they are; that they are as they are is not only enough for him, but it would be utterly beyond his province to inquire how they came so to be. Thsrefore, *so far as his investigations are concerned*, there is no God; or, to use the word above suggested, his investigations are *atheous*. But they are not *atheistic;* and he may carry on his work, not merely without fearing the Psalmist's condemnation of the fool, but with the full psrsuasion that the results of his labers will tend to tho honor and glory of God."—*The Lord Bishop of Carlisle.*

Bonsilate is the name given to a new prednct, intended as a suhstitute for ivory, bard ruhbsr and other kindrsd substances, in the manufacture of a variety of articles, such as csnee and umbrella handles, checkers and dominos, clock cases, and other ornamental objects. It is said to be harder than celluloid, and to be susceptible of being molded in dies, liks other plastic materials. It can be formed into bars, etc., and can bs turned, polished or eawed into any shape, similar to ivory. By the propsr admixture of coloring matters, malachite, costly marbles, etc., can he imitated with it, as is the case with celluloid. It is said to be made from finely-ground bones, agglutinatsd with some cementing substance, which, from tbs name adapted for the product, we suspect may be silicate of eeda. The details of the manufacture are, as yet, kept secret.

A Safety Lamp upon a New Principle.—Herr Koerner, a etudent at the Freiberg School of Mines, proposes to prevent colliery explosions by the use of a lamp which embodies an intsresting novelty. Its action is based upon the property of platinnm hlack, of condensing on its surface not only oxygen, but also light carhureted hydrogen. In a wire gauze chamber are placed pieces of pumice-etone impregnated with platinum black; and as all the air for maintaining the co mhustion passes through the chamher, all the fire-damp ie destroyed before it reaches the open flame.

The Highest Velocity of Wind.—Observere do not agree as to the highest recorded velocity of the wind, and, indeed, it is difficult to ohtain an exact measurement. It is said that 110 miles an hour has been recorded as tbe velecity of the wind blowing in a straight line, while a cyclone, or wind with a rotary motion, obtaine a much greater velocity—say abont 180 milee an hour.

Absence of Sunlight.—Dr. Carpenter saye that entire absence of sunlight on the deep-sea bottom seems to have the same effect as the darkness of caves, in reducing to a rudimentary condition the eyes of such of their inhabitants, as fish and crustacea, which ordinarily enjoy visual power; and many of these are provided with enormously long and delicate feelere or haire, with which they feel their way abont, juet as a blind man does with his etick.

A CANOE capsized in the Skigit river, Monday of last week, resulting in the drowning of six miners. Six others, including an Indian, who were in the canoe at the time, escaped with their lives. The accident is attributable to the overloading of the canoe, which contained, besides the 12 in question, 700 pounds of freight. Following are the names of the men who perished: David Ball, Skagit; Arthur I. Dempsey, Quincy, Cal.; William Murry, Seattle; William H. Goucher, Oregon; James Scanlin, Quincy, Cal.; Captain Stephen Henry, Seattle.

MINING SHAREHOLDERS' DIRECTORY.

The Mining Bill.

The proposed changes in the United States mining laws, suggested by the Public Land Commission bill, are still the subject of serious discussion. All of our cotemporaries with any interest in mining matters, have published editorials and communications, universally condemning the measure. Miners' meetings have been held, and protests signed and forwarded to Washington. It is, as previously stated in these columns, not probable that any definite action will be taken during this session of Congress, though there may be; but it is as well to keep alive the discussion, to let the members know that the miners are opposed to the suggested changes.

At a meeting of the House Committee on Mines on Tuesday last, Representative Bedford offered a short and simple substitute for the Public Land Commission bill. This substitute proposes to confine all new legislation on the subject to an amendment of Section 2,322 of the Revised Statutes by adding to said section the following words: "And in all cases where the main dip of the lode, vein or ledge does not exceed 30° from the horizon, the right to follow to the mineral shall not extend beyond the side line drawn downward vertically." Senator Jones and Representative Daggett were present when this substitute was offered. They stated that they could see no objections to its adoption, they being satisfied that a distinction should be made between flat lodes and fissure veins. Mr. Bedford suggested that the Congressional representatives of the mining States and Territories should meet at Senator Jones' house and definitely agree upon a measure regulating the location of flat lodes that do not appear upon the surface, and a meeting will be held accordingly.

As soon as the bill is agreed upon it will be introduced in the House and Senate, and pressed for passage without delay. The Public Lands Commission bill is opposed by all the members from the far West, and a number from the East, and Tuesday's proceedings in Committee indicate that, as it stands at present, it will not become a law. Senator Jones, in the course of his argument before the Committee to-day, cogently remarked that the miners are familiar with the existing law, and that all the conceivable questions growing out of it have been adjudicated. He then distinctly intimated his opinion that the pending bill had been gotten up in the interests of mining lawyers and so-called "experts," who desire new laws and new conditions in order to open up for themselves further opportunities for employment.

The Mining Share Market.

There appears to be no immediate prospect of a rise in the stock market, the depression continuing with remarkable consistency. There has been a ripple of excitement over the failure of the firm of D. Z. Yost & Co. The amount of the firm's liabilities is stated by Mr. Yost to be about $110,000. The cause of the suspension is the inability of the firm to any longer stagger under a load of bad accounts and indebtedness, many of which the firm have been carrying.

The following monthly statements have been made: Con. Virginia, cash on hand $245,274.38, and 44,873 ounces of unsold bullion; California, $48,207.83; Utah, cash on hand, $15,466.45; Best & Belcher, $569.72; Alpha, indebtedness, $19,854.63; Gould & Curry, cash on hand, $26,797.54; Occidental, $12,456.17; Hale & Norcross, $17,781.87; Alta, balance to credit, $51,926.55; Benton Con., $127,861.63; Lady Washington, indebtedness, $5,544.74; Ophir, $124,380.09; Mexican, $52,960.84; Crown Point, $17,897.94; Belcher, $33,441.66; Con. Imperial, $14,185.12; Chollar, cash on hand, $16,504.22; Potosi, $16,454.65; Silver Hill, indebtedness, $2,700.76; Union Con., cash on hand, $55,730.59; and Sierra Nevada, indebtedness, $12,542.37. Exchequer, cash on hand, $26,249.81; Bullion, cash on hand, $29,773.16, with a portion of delinquent assessment yet to collect. There is an indebtedness, however, to be paid during the year, for three-fourths of the Ward shaft, of $300,000. Julia has $14,024.15 cash on hand, and company's notes out for one-fourth Ward shaft for $100,000. Justice has an indebtedness of $15,678.78, after deducting cash on hand and value of recent supplies. Northern Belle has $98,544.85 after paying all debts up to April 30th. Standard had $136,912.95 cash on hand April 30th, over all indebtedness. Bulwer, cash over all debts, $15,908.32. Bodie had on hand April 30th, $20,822.78, from which the expenses of the mine for April are yet to be deducted, and other liabilities amounting to $1,919.85.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

PACIFIC BELL TELEPHONE CO.—May 4th. Object: To construct and operate telephone lines in the State of California and elsewhere. Capital, $100,000. Directors—George S. Ladd, Monroe Greenwood, Henry C. Hyde, Milton A. Wheaton, Clarence R. Greathouse, James Gamble and Samuel O. Hunt.

SPRING VALLEY M. CO.—May 3d. Location: Devil's Gate district, Nevada. Capital, $30,000,000. Directors—A. K. P. Harmon, Isaac L. Requa, John Skae, Thomas H. Williams and C. G. Funk.

NEWCASTLE M. CO.—May 5th. Capital, $50,000. Directors—Charles E. Allen, O. O. Burgess, E. G. Matthews, J. A. Rudkin and H. C. Kuhl.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

IDLE.—Amador *Dispatch*, May 1: The Zelle mill had to be idle for a few days at the beginning of the week, owing to a break in the pipe carrying water across Jackson creek just below town.

SUTTER CREEK.—Cor. Amador *Ledger*, May 1: The difficulty in the Lincoln with regard to the water is partially overcome. The hoisting of ore has been resumed, and the 40-stamp mill is in motion again. A strong flow of water is encountered, which requires close attention. It is now conquered, or nearly so; at any rate, the worst of the trouble is past.

CONSOLIDATED AMADOR.—The late flood in Sutter creek carried away the dam above the mill, and the free water supply for the mill has consequently been cut off, compelling the company to get all their water from the Amador canal, thereby entailing extra expense.

FRENCH CAMP.—The Olentanza shaft is down 40 ft, with a 4-ft ledge, and looks well. They have out about 150 tons of rock, which will pay $8 per ton.

AMADOR GRAVEL MINING COMPANY.—Amador *Ledger*, May 1: The partial clean-up made recently paid fairly. The sluice boxes alone were cleaned, and we are told the sum of $300 was obtained. Drifting is now in progress. A lead of blue gravel, found close to the bed rock, is being drifted upon. Its extent is yet undetermined, but the gravel prospects exceedingly well.

VOLCANO ITEMS.—A clean-up at the Downs mine, made last week, yielded at the rate of $20 per ton. They are now commencing to open a level at 450 ft. After getting the prospecting pretty well advanced, if the outlook is favorable, it is reported that Mr. Downs will put up a mill this summer. The last clean-up of the Golden Gate mine averaged about $21 per ton. The big tunnel enterprise advances at a good rate. Since J. W. Moyle took charge of the undertaking, the tunnel has advanced at the rate of 2 ft per day. It is now in over 1,500 ft, with less than 800 ft to bore through. When work is fairly started from both ends, it is expected to make 5 ft per day, as the rock at the upper end is much softer than that which they are now passing through.

MISCELLANEOUS.—Wm. Moore has received the contract to deliver 2,000 timbers to the Amador Consolidated mine at Sutter Creek. These timbers have to be hauled from the vicinity of Whitmore's mill, a distance of 20 miles from the mine. L. McLaine brought down to Jackson on Tuesday bullion of the value of $14,000, the output of Volcano district for the past month. The sulphurets from the Zelle mine are being hauled to the Carland reduction works at Sutter Creek. At last one clean-up has been made at the Zelle mine, but it is impossible to say with any degree of certainty the exact amount realized. All the prominent mines of the county keep the bullion output a secret as much as possible. We do not know the reason for this, but such is the case. The Zelle is no exception to the rule. All that we can say is that the mine is paying, but that is good enough news, anyway. The Yellow Jacket of Drytown has not yet recovered the carrying away of the water to the mill, but expects to in a few days. The North Gover has struck a body of ore, a foot wide, of a payiug grade, with hopes that it will expand into a bonanza. This will encourage the stockholders to pungle up their assessments. Sinking is about to be resumed at the Empire, of Plymouth. The south shaft is to search the earth another 100 ft, from the 1200 to a 1300 level. The mine is looking as well as ever.

BUTTE.

PUSHING WORK.—Oroville *Mercury*, April 30: The Spring Valley hydraulic gold company are hiring every applicant for employment. There is not an idle man to be found in Cherokee, and a large number of those at work hail from outside communities. Superintendent Waldeyer is evidently determined to develop the property for all it is worth. He informs us that a blast requiring 25,000 pounds of powder will be fired in a week or two.

BUTTE GRAVEL MINING CO.—Superintendent Rhodes floated the boat of the Butte gravel mining company into the pit of the old Henrietta works Wednesday. Flumes are in process of construction, and the patent pumps will be working the dirt of the banks Monday or Tuesday.

CALAVERAS.

MINING ACTIVITY.—Calaveras *Chronicle*, May 1: The ditch has recovered from the injuries it received during the storms and is now whole and sound. There is an abundance of water, and as a consequence of all these good things, great activity is observable in mining operations. All the hydraulics and tunnel claims are in full and successful blast, and the probabilities are that there will be no more interruptions this season.

MINE FLOODED.—During the recent storm the Wallace & Ferguson mine, at Sheep Ranch, was flooded, the water rising about 120 ft in the shaft. The 300 and 400 levels are both under water, or have been. At last accounts the water was being lowered slowly.

RICH STRIKE IN THE CHAMPION.—We are much pleased to learn that a big body of exceedingly rich ore has lately been uncovered in the 400 south level of the Champion mine at West Point. The ledge shows fully 18 inches wide and the rock assays over $100 per ton. The Champion stands very near the head of first-class mines.

MITCHELL MINE.—Developments still continue with the good weather. Messrs. Bastian & Jones are opening up the old Mitchell mine again. A tunnel is being run a distance of 750 ft to tap the lode 130 ft deep. Seeing that the claim has always held up its own reputation, we may expect good results for the present owners.

ANNA MINE.—Messrs. Stager & Breeze, of this town, and Judge Leavitt, of Mokelumne Hill, are about to open one of the richest mines known to exist in West Point district. It is and has been known as the Anna mine, situated on the extension of the Lone Star and Woodhouse mines. The mine was worked in the days of 1852, the rock taken out averaging $1,000 per ton. The lode runs due north and south with a pitch of 13° to the west. The owners have met and agreed to commence operations on their bonanza, so look out for the future.

MINING at Vallecito is at present on a standstill, on account of too much water.

THE Bonanza mine, near Copperopolis, has stopped work for the present. It is reported that the company intend putting up larger works for crushing the ore.

NEW LEAD.—Angels *Echo*, May 2: A quartz lead has recently been discovered on Bear mountain, near Croset's ranch, which is about 20 ft in width. In the center of this huge vein is about 4 ft of quartz, which differs in color from the main vein on either side. Several assays have been made from this rock, one lot of which assayed $7 in gold and $13 in silver.

A MEXICAN, living near Albany flat, recently found a beautiful quartz specimen weighing a fraction over $10. Albany flat is famous for coarse gold diggings, and many fine specimens have been found in that section.

STOPPED WORK.—Calaveras *Citizen*, May 1: Work in Haggin & Co.'s mine, at Sheep Ranch, has been suspended for the past week or two, owing to the lack of a sufficient quantity of wood to keep the mill running. During the recent storm the mine became partly filled with water, and the pump has been kept constantly going to lower it. Work will probably be resumed the first of the week.

EL DORADO.

MINING ENTERPRISE.—*Mountain Democrat*, May 1: Last Saturday we paid a visit of inspection to the mining operations of the Hulburd Brothers—Byron and Hiland—at Little Spanish hill, a short distance south of Upper Placerville. Taking advantage of the enforced idleness of their fruit canning and drying business, these energetic young men commenced prospecting a gulch or swale that heads in Little Spanish hill, crosses the lower end of their orchard and empties into Cedar ravine. Their success here exceeded their most sanguine expectations. Mixed with their gulch gold they occasionally found specimens of gold-bearing quartz, one of which was quite large and exceedingly rich. This induced them to explore for a quartz ledge in the adjacent hill. Here again, they have been rewarded with what promises to be a most gratifying and profitable success. At the head of the gulch, after stripping off a few ft of slate, they discovered a quartz seam a few inches thick that yielded a flattering prospect. Following this about 100 ft up the hill, the rock continued to improve in quality, and they sank a shaft to a depth of about 40 ft, when, owing to the excessive wetness of the season, they were driven out by water; not, however, until the ledge had increased to 3 or 4 ft in thickness, all prospecting handsomely and developing well-defined foot and hanging walls, and a 4- to 6-inch gouge. They then went down to the foot of the hill, where they have put up a modest but substantial and well arranged little 2-stamp prospecting mill, to be run by a hurdy-gurdy of 6 ft 2 inches in diameter, with a water pressure of 175 ft. In prospecting the ledge, building the mill, laying the pipe and setting up the hurdy-gurdy, they have, though perfect novices in such work, performed all the labor themselves, and have done it well. So that, at a comparatively trifling outlay in money, and in utilizing time that would otherwise have been wasted, these enterprising young men are in a position to prove what the ledge is worth.

MONO.

MAMMOTH.—Mammoth City *Herald*, April 28: During the week past no work has been done in tunnel No. 3. In No. 4 a distance of 48 ft has been run, following in on the footwall, with the same formation of clay and slate gangue lying between the footwall and the ledge, which works so easily that the use of the Burleigh drills has been dispensed with. Considerable water is still flowing, but does not interfere with the workings, being easily carried off by the sub-drain. The total length is now 1,301 ft.

H. L. & M. C. JOINT TUNNEL.—Master Mechanic Colby arrived from Bodie on Monday morning with the new piston and other machinery necessary for the repairs to the engine of the air-compressor, which were immediately put in place and the machinery started. The new parts of the engine were manufactured at the Bodie foundry under the personal supervision of Mr. Colby, and reflects great credit on that establishment, everything fitting to a nicety.

SEVERAL parties have started out prospecting towards the southern portion of the county, and others are making preparations to start as soon as the grass is sufficient for animals to live.

COOP reports come from the mines in South End. The ledges in that portion of this district are showing up very well, taking into consideration the small amount of work which has been done on them.

OTHER attachments have issued against the True Blue mining company's property.

WORK was recommenced yesterday at the M. C. & H. L. tunnel. The usual force of miners have been put at work.

LAUREL DISTRICT.—Jack Casey has come in from this promising mining locality, situated about 7 miles south of Mammoth and immediately adjoining Lake district. Mr. Casey is highly elated over the rich discoveries of ore in the IXL mine, of which he and Mr. McLain are the owners. The ledge is represented as being large, and, from the samples left at the *Herald* office, is very rich in gold and silver. There are many other large and rich ledges in this district, and a large amount of work will be done during the coming summer, and we may look for some very rich and important developments. The ores differ somewhat from those of Lake, in that they are in a lime formation and baser in character, and will have to be roasted before milling. There are good reasons for believing that a mill will be built during the summer. The facilities are good, wood, water and building materials are bountiful, and the district easy of access.

SIERRA.

FOREST QUEEN.—*Mountain Messenger*, May 1: Work is to be commenced immediately on the Forest Queen quartz mine, near Downieville.

CAVE.—There was quite an extensive cave in the North Fork diggings at Forest City, last week. No one was injured, but considerable work was necessary to repair the damage.

MONTE CRISTO.—Our mines are doing but little at present, owing to the severe storm, but expect to boom shortly. The Mountain Lava, formerly the Empire, has suspended operations indefinitely. The storm which commenced nearly two weeks ago has been the roughest of the season. Snow is scattered about all the way from 5 to 40 ft deep; a fair average, however, is believed to be about 14 ft.

SISKIYOU.

THE MINES.—Yreka *Journal*, April 28: The men engaged in cleaning out and improving the Big ditch above Cottonwood gulch are now above Townsend's and near Surface gulch. The building survey of the ditch from Cottonwood gulch to Hawkinsville, on the east side of Yreka, has also been completed. Work is also being prosecuted in building the reservoir at Cottonwood gulch, which the water will be let into, so as to get full by the time the new ditch is ready, and by the aid of such surplus the upper ditch will furnish enough water to keep the new extension supplied. The new ditch along the east side of Yreka is to be 4 ft wide at the bottom, 6 ft at the top and 3 ft deep, with a fall of over 8 ft to the mile, and the highest elevation of any of the flumes will be about 56 ft. At Oberlin's gulch, south of Yreka, there will be a long flume, and also another at the Conover place, back of McNulty's, north of town. All the hydraulic companies in Scott valley and throughout the county are now busy piping down the gold-yielding banks, and ought to have been at work two months ago to put in their usual spring and summer season. The cold weather hanging on so late has prevented the flow of water, and though there is a great quantity of snow on the mountains, it is likely to melt off with a rush under the influence of the warm days, rather than hold out over a few weeks longer than general at most.

SHASTA.

FRENCH CULCH.—Reading *Independent*, May 1: The quartz mines are beginning to bring in their bullion in considerable "wads." The Apex mine cleaned up, after grinding between 6 and 7 tons of rock, $1,400. The Brown Bear is paying from $50 to $60 per ton, with fine prospects in free gold. The Niagara company, after a short run, cleaned up $1,000. The Centennial company have been crushing some rock to clear their platform, and upon scraping out the arastra obtained $1,000. The miners on Deadwood are also forwarding bullion.

TRINITY.

DITCH SLID OUT.—Trinity *Journal*, May 1: A portion of J. W. Smiley's ditch, which conveys water to his mine at Douglas City, slid out the first of this week. It is a very bad break and will be a big job to repair it.

FROM Jack Blackwell, Altoona mail-man, we learn that the Altoona quicksilver mine has shut down; also that there are 5 ft of new snow in Cinnabar.

MINERS all over the county are at work with a good supply of water.

NEVADA.

WASHOE DISTRICT.

UNION CON.—Gold Hill *News*, May 5: The drift on the 2500 level is in a heavy vein formation and is still east of the water belt. In fact it was to escape the water known to be in the formation lying west of that in which the present work is carried on that the east drift on the 2400 level was pushed so far out and the winze sunk where it was. This drift will probably encounter water, however, before the connection is made, since there is a heavy flow into the Sierra Nevada incline on the 2500 level.

OPHIR.—There is still much quartz in the vein matter encountered in the east drift on the 2500 level. The new drift running north from the above east drift and 330 ft east of the incline is following the heavy formation of quartz and clay there encountered, and is designed to open it up and ascertain its value. The joint Mexican crosscut east on the 2500 level is in a singular formation of highly silicified vein porphyry, which looks well.

SIERRA NEVADA.—The north drift on the 2300 level has been pushed a distance of 750 ft from the east winze, and work at that point suspended for the present.

CALIFORNIA.—Work on the stopes, 1750 level, was resumed Monday night. Prospecting for ore east of the old stopes on the 1500 level continues.

NORTH BONANZA.—The crosscut west on the 600 level has penetrated the ledge 70 ft and cut nearly through it. The body of base ore on this level is richer than on the 400 level, but not as large.

MEXICAN.—The drift north on the 2500 level has its face 65 ft from the Ophir line, and is in a vein formation, carrying some quartz.

SILVER HILL.—The pump bob on the surface has been changed and other repairs to the pumping apparatus made and everything put in good shape.

BEST & BELCHER.—The joint Con. Virginia crosscut east, 2000 level, has been abandoned for the present, the supply of air which was derived from the Booner shaft having ceased.

BELCHER.—The work of clearing out the caved portions of the south drift, 3000 level, progresses as well as the extreme heat there will permit.

SAVAGE.—The flow of water into the drift toward the inclins on the 2400 level of the C. N. S. shaft is still too strong to admit of the resumption of work.

SUTRO TUNNEL.—The north header is being pushed along rapidly into California ground. The south lateral branch of the tunnel is once more being pushed ahead and making good progress, the header having been started again yesterday.

ANDES.—East drift on the 400 level has shown some good-looking quartz, but still of low grade.

CON. VIRGINIA.—Monday night the men were replaced in the stopes on the 1750 level, and the usual output of ore was resumed. Work was resumed in the drift to connect the C. & C. shaft with the north lateral branch of the Sutro tunnel Sunday night. On the 2300 level the joint California crosscut continues to penetrate heavy vein matter.

OPHIR.—The southeast drift on the 1650 level is still following the vein in that direction, and as it passes along it turns out some nice looking quartz, and some bunches of ore, but no regularly formed and well defined ore body has yet been encountered.

ALTA.—East crosscut, 1050 level, is in a distance of 125 ft, and no sign of an east clay has yet been found.

EUREKA DISTRICT.

GRANT MINE.—Eureka *Sentinel*: This mine is situated on the extreme south end of McCoy hill, and has been leased since the 1st of January last to Messrs. McMahon & Conway, who, after doing a large amount of dead work, in order to put the mine in proper shape, have, within the last 45 days, hoisted over 100 tons of ore, which will run from $75 to $100 per ton, and have at least double that amount in sight in the mine ready to break down.

THE ZULU.—At the bottom of the 100-ft shaft a drift is being run in a westerly direction, and about a week ago a body of ore was uncovered of a similar character to that found in the Grant. Every indication shows that the main ledge will be cut before many more feet have been run.

EUREKA TUNNEL.—The tunnel is in a distance of 1,225 ft, and before the close of many weeks the contractors expect to strike the main ledge.

SILVER CONNOR.—This mine is making rapid headway with their new shaft, and when it is completed will be able to work the mine to far greater advantage than its present condition permits. They have already a large amount of ore on the dump, which will be shipped to the reduction works as soon as the trails are open.

THE SAN JOSE.—This mine is being worked under lease by Messrs. Taylor & Shindler, and within the past month has made some very important developments. This is one of the most valuable properties on Prospect mountain, and one which will, before long, be counted as one of the leading bullion-producing mines of the district. The present lessees are extracting from 1½ to 2 tons of ore per day, which will average from $120 to $175 per ton.

ARIZONA.

SOLD.—Tucson *Record*, April 27: The Mina Verde claim, near Altar, has been sold by Chas. Isenbach, of Tucson, to San Francisco men for $10,000 cash. Mr. Isenbach left yesterday with the purchasers for Altar to turn over the property.

WASHINGTON.—Mr. W. H. Walker and Col. Thos. Morgan came in from Washington camp yesterday, and are enthusiastic over the town and mines of Washington. These gentlemen have prospected and worked in this district for two years, and have many valuable claims and mill sites. On the 23d instant native silver and copper were struck in the 50 level of the Holland mine, now owned and worked by Luttrell & Co. The W. C. Davis and Pensacola, under charge of James Finlay, are taking out ore, and ore only. Jack Hawkins and Al. Skinkle, of Colorado, are running a tunnel in the Lafayetto, and have struck a fine body of carbonate, galena and black sulphates, the latter the first ever found in camp. The Lafayette is considered one of the most promising claims here. Property in Washington now commands good price, and those who have held on are reaping their reward.

A DISTRICT, rich in mineral, is being organized 35 miles north of Camp Grant. The leads are described as cropping up 40 and 50 ft in the air, and as 20 to 60 ft in width. Some magnificent specimens of top rock, full of horn silver, were brought into Tombstone yesterday and assayed from $300 to $800.

EVERGREEN DISTRICT.—Mayor R. N. Leatherwood and C. O. Brown came in yesterday from the Evergreen district, west of Picacho and 45 miles from here. They visited the Young America copper mine, recently sold by Mr. Brown to California men, and describe it as a mountain of copper. Met Messrs. Gibson and Murphy, who were working some silver claims there and found the prospects all looking well and the hills full of prospectors.

ARIVACA DISTRICT.—Tucson *Record*, May 1: Joseph Elliot, deputy Sheriff of the village of Arivaca, arrived from the latter place yesterday. Arivaca is building up rapidly, and while there is no particular rush to the town observable, the improvements under way are of a character which betokens confidence in the permanence of the town. Both the Derre & Townsend and the Arivaca mills are in operation constantly. Mine owners in the district are at work developing their properties, and results so far are most favorable. Greater activity now prevails in this region than has ever previously been observable. The town is quiet and orderly, which Mr. Elliot considers due to the fact that most of its residents are interested in the mines, and their time is more devoted to exploring of them than in indulging in the pastimes which too often marks the history of frontier settlements.

BABOQUIVARI DISTRICT.—Tucson *Record*, May 1: We are indebted to Mr. Wm. Clark for the following items regarding this district, which is not much known, but whose ores entitle it to final rank in the list of southern Arizona's booming camps: Baboquivari district includes that section of the country surrounding the eastern base of Baboquivari peak, one of the prominent land-marks of Arizona, and lies about 20 miles west of Arivaca. But little prospecting has been done so far, but limited explorations have resulted in wonderfully rich finds. The veins discovered are large and well defined, and carry high-grade gold and silver ores. Prominent among the mines being worked is the Alta, owned by Hudson & Bent, which shows a ledge 20 ft in width. The vein has been opened up by a 20-ft shaft and 13-ft drift. Ore was found from the grass roots down worth $600 to $700 per ton, which is being sacked for shipment. The same parties are also owners of the Pittsburg, on which two shifts of miners are now working. Twenty tons of ore now on the dump will run $200 to the ton. The Black Hawk, owned by Hardwick & Clark, has a shaft 55 ft deep, and showing ore its entire width. The Cincinnati, owned by the Raney Bros., is being developed by a tunnel, now in 53 ft. A vein of high-grade ore has been discovered to a width of 10 ft. In this district wood is abundant, and water is obtained by sinking wells to a depth of not more than 45 or 50 ft.

Distribution of Lakes in the United States.

[By Prof. John Le Conte.]

There are numerous lacustrine basins to be found in the States bordering the Pacific ocean. As in other regions of the globs, tbeir distribution ie determined by the configuratiòn of land, or, more specifically, by the forms of tbe great hydrographic basins in the interior of the continent; hencs some general idea of the topography of the Western portions of the United States ie an sseential preliminary.

Topography.

One of tbe grand topographical features of ths two American continents is the system of mountains bordering on the Pacific coest, extending from Cape Horn to the North Polar sea. This vast system of mountein chains bes been collectively designated by some geographers as the Cordillieres. Different portions of it have received special designations, as the Andes, in South America; the Sierra Madre, in Mexico; and the Rocky mountains, the Sierra Nevada end the Cescede Range, in the United States. This great mountaiu system, entering the United Statss from Mexico, rapidly widens and subdivides into a lahyrinth of mountain ranges, the whole mass having a maximum width near the parallel of 39° or 40°, of about 1,000 miles. According to Prof. J. D. Whitney, the whole area embraced within this mountainous belt is but little, if any, short of 1,000,000 of square miles. The enormous mass included within the extreme boundaries is of a somewhat lozenge-sbape, the length of each side being ahout 600 or 800 miles; "ie formed hy the Sierra Nevada and the Cascade Range on the two westerly faces, and by the Rocky mountains, with the Big Horn, Wind River and Bitter Root ranges, on the two easterly facee." Between these two gigantic mountain systems lies the

Great Interior Plateau,

Whicb constitutes the great physical feature of our territory. The plateau thus enclosed has in its central section from eest to west, in the pathway along which civilization has advanced, an elevation of 3,000 to 7,000 fset, falling off to the north and to the south; and in the latter direction sinking more than 200 feet below the sea level. Ths drainage of this vest area ie accomplished hy thres great rivers and their numsrous trihuteries, viz.: 1. The Columbia river in the north, discharging into the Pacific ocean. 2. The Rio Colorado of the west, discharging into the Gulf of California. 3. And ths Rio Grande del Norte, discharging into tbe Gulf of Mexico. That portion of tbis greet plateau which has been designated the great interior hasin is without outlet to the sea. The great plateau is traversed hy various ranges of mountains, of which the Wahsatch, extending north and south through nearly 400 miles, is the most notahle. Between the Wahsatch and the Rocky mountains runs the Uintah range, the only high and well-defined chain in ths Cordilleras haviug an east and west trend. It is likewise traversed by several subordinate ranges of considerahle magnitude, and is diversified hy innumerahle spurs and ridges, transversc narrow valleys and occasionally broad plains; the valleys being sometimes green, attractive and refreshing, while the plains are always arid, repulsive and dcsolate to the last degree.

It is evident thet this portion of our territory lying hetween the lofty snow-clad Rocky mountains on its eastern margin and the Sierra Nevada mountains on its western houndary, can reccive hut a scanty supply of moisture from the vapor-hearing winds coming from either the Atlantic ocean and the Gulf of Mexico ou ths one hand or from tbe Pacific ocean on the other. Many of ths streams are largely supplied with water from the melting of the snows, which crowu the cummits of the two great mountain houndaries. Many portions of thess arid plains only need water to rendsr them fruitful; in such cases, when irrigation is practicahle, the seeming deeert may be made to hloseom.

Great Basin.

Ths central portions of what ws have designated as the great plateau is divided into two distinct regions hy the Wabsatch range of mountains trending nortb and eouth near the eastern horders of the Grsat Salt Lake for ahout 400 miles, viz.: 1. The great platean proper lying, at an elevation of ahout 7,000 feet ahove the sea level, between the Rocky mountains on the east and the Wahsatch mountains on the west. 2. The great hasin lying, at an elevation of about 4,000 to 5,000 feet, betwesn the Wahsatch range on the east and tbe Sierra Nevada on the west. The region occupied hy the mountains hordering the great basin has no drainage into the sea; the streams that head in the mountains find their way into saline lakes, disappear in sinks, or are loet in tbe sands of the deserts, where their watere are evaporated.

The great hasin region is subdivided hy the Humholdt mountains into two suh-hasins, viz.: *a.* The Salt Lake hasin, in which lie Salt lake, Utab lake and Sevier lake. During glacial times thcre was a large expanse of fresh water in this hasin; and, according to G. K. Gilbert, at some former period, the waters of this basin rose so high that they overflowed to the ocean through Red Rock pass into the Snake and Columbia rivers; at this epoch its water-level was about 960 feet above the present level of the Great Salt Lake. *b.* The second sub-baein is the Humboldt basin, which lies between the Humboldt range and the Sierra Nevada. A number of smaller lakes and sinks, such as Pyramid lake, Humboldt sink, Carson lakś, Walker's lake, and others which dot tbs surface of the State of Nevada; and likewise Mono and Owen's lakes, in California, are included in the same general depression. The cstimated area of these two interior basins without outlet to the eea, is about 210,274 square miles.

Great California Valley.

Everyone is familiar with tbe fact of the existence in California of two great masses of mountains, one designated the Sierra Nevada, lying in the eaetern portion of the State, and the other the Coest ranges, bordering on the sea near the western boundary. Between the parallels of 35° to 40°, there is no difficulty in separating the Coaet ranges from ths Sierra Nevada.

The great California valley, composed of the Sacramento and the San Joaquin, varying in width from 40 to 60 miles, forms a striking feature in the topogrephy, heing walled in hy the Sierra Nevada on the one hand and the Coast ranges on the other. The hroad valley thus defined, forms a complete separation of the two systems of mountain chains. But, if we go south or north of latitudes 35° and 40° respectively, the condition of things changes. In the neighborhood of the Tejon nass, ahont latitude 35°, the ridges of the Sierra Nevada and Coast ranges come togsther, inosculate and become continuous, and topography alone, independently of geological considsrations, affords no clew to whsre ons csases and the othcr hegins. The same is the case with regard to these two mountein ranges north of the head of tbe Sacramsnto valley. North of Sbasta City (latitude 40° 35') the ranges close in on all sides, and in the labyrintb of chains thsre is no possihility of preserving the distinction bstween the Sierra Nevada and the Coest ranges. Within these limits and along an axial line heving a direction of north, 31° west, extending for a distancs of about 400 miles, the topographicel features of California assume a grand simplicity.

Nearly parallcl to each other we have: 1. The eastsrn slope of the Sierra Nevada extending into the State of Nevada. 2. The Sierra Nevada range of mountains. 3. The great valley of Celifornia. 4. Ths Coast ranges.

Passing north of California into Oregon, we come, in latitude 43°, to the two heautiful and fertile valleys of the Umpqua and Willamette, which here form almost as striking a esparation between the Cascade mountains on the east and the Cosst range on the west, as doce the great California valley.

Arid Regione.

In ths United Stetes tns regions of the great plains—the vast, treeless country thet stretches away from the eastern hass of the Rocky mountains and the great platsaus and basins lying west of the same range of mountains—constituts the arid areas, where agricultural operations are impracticahle without more or less irrigation. It has heen estimated that this arid region is more than one-third of the entire area embraced in the United States. From actual surveys and careful estimates, it would seem that it will not be possihle to redeem mors than thres per cent. hy irrigetion, whsn every brook, creek and river is utilized. Less than four per cent. of the region cen be said to be forest-clad. Thcse forests are restricted to the sides of the high mountains, and extend over the more elevated foothills. This does not include lerge areas covered with a scanty growth of dwarf cedars and pines, useful for fuel, hut of no value in mechanical industries. Over the remaining districts a large portion is covered with grasses and other plants, which may, to soms extent, he utilized for pasturags. Small valleys lying along mountain streams, will doubtless receive the most carsful and elaborate culture, affording fertile grain fields, vineyards orchards and gardens. The mountains, bills and plains will furnish nutritious hut scant pasturage for herds and flocks, but, after all, the agricultural resources of tbis vast area must he very limited. Gold, silver, copper, iron, coal, salt, and many other minerals are found in abundance; so that the rsgion will bs chiefly valuahle for its mineral wealth.

Cause of Aridity.

The mechanical causes of all terreetrial currents of air or winds must he sought for in the disturhance of atmospheric equihbrium produced by the unequal distribution of solar heat on the surface of the globe. Solar heat must, therefore, be looked upon as the "primum mobile," which originates and keeps in continual action the agencies which perpetuate ths atmospheric circulation. In other words the action of solar heat, combined with the very important modification produced hy the rotation of the eartb upon its axis, afforde a fnll and eatisfactory explanation, at least in a general and comprehensive view of the great eyeteme of winds. The operation of tbis good phyeical cause necessitates the general prevalence of weet winds near the eurface of the eartb in the temperate zones. The great water snrfaces are tbe chief sources whence the largeet supply of moisture in the form of aqueoue vapor is derived. The winds are the chief mechanical agente by which tbose vapors are wafted to distant points where they are condensed into rain or snow, dropping richness and fertility on our fields, and covering our hills and mountain slopes with veetments of verdure. The land is, directly or indirectly, tbe agent which bringe about the condensation of aqueous vapor. It accomplishes this result, either (as in the case of winds cerrying vapors up mountain slopes) hy forcing the vapors into higher and colder regions, or by creeting upward currents of air hy the action of solar heat, and thus conveying the vapors aloft into the colder regions of the atmosphere. Thus, in a general sense the oceans, seas and lakes constitute a vast vapor-furnishing apparatus, while the continents and ielands constitute a huge condensing apparatus; between them a gigantic process of distillation is carried on, which waters the earth and clothes the land witb vegetation. Moreover, it must not be forgotten that the great thermal influence emeuating from the sun alone has the power of putting in motion this immense apperatus. For the western portions of our territory, the Pacific oceen constitutes the great vapor-furnishing surface; ths prsvailing west winds sweep the vapors upon the lands lying to the east of the ocean, and tbe mountain ranges furnish the condensing apparatus. It is evident, therefore, thet all the aqueous phenomena of the atmosphere, embracing fog, rain and snow, mey bs rationslly accounted for hy attending to the three following considerations: (1) The position of hodies of water furnishing equeous vapor of greater or less tension; the degree of tension having relation to the temperature of the water. (2) The direction of the prevailing winds sweeping the vapor to regions of condensation or otherwise. (3) The configuration of the adjacent and remote lands, in promoting or opposing the operation of causes producing condsnsation of the vapors.

Applications.

These general pbysicel principles ars readily applied to the explanation of the aridity of ths extensive areas lying eest of the Sierra Nevada and Cascede mountains. Through the whole length of California the Sierra Neveda are lofty end continuous, presenting an almost nnhroken ohain, with an avsrage elevation of about 10,000 feet. This "great sea wall" almost complstely shuts off the moisture borne hy the vapor-bearing west winds coming from the Pacific ocean. The small amount of moisture thet surmounts the lofty snow-clad crests of thess mountains, is barely sufficient to produce a scanty precipitation of rain and snow from December to May each year, during the rainy season of the coast ranges. Hence we find east of this huge wall through the central portion of the State of Nevade, from the Mud lakes of the north through the Humholdt desert and the great Salt valley, and on the eouth to Death valley in California, a region of sxtreme aridity and barrenness. Most of this vest area is dreary and desolate heyond concsption, bsing nearly destitute of water and vegetation, fearfully hot in eummer, and occesionally swept hy terrible send storms. North of latitude 41° the Cescads and other ranges constituting the continuation of the Sierra Nevada mountains, have a meen elevation of only ahont 6,000 to 7,000 fest; so that a somewhat larger supply of moisture from ths Pacific ocean reaches the plateeus and basins lying between them and the Rocky mountains. It is principally for this reason that eastern portions of Washington Territory and Oregon and the whole of Idaho, although situated in northern extensions of the arid regions, receivs a somswhat lerger eupply of rain than corresponding districts in Neveda and California.

It bas already been remarked that thcre ars unquestionable indications, that in a former epoch a largs portion of the great basin was coversd with watsr. During the Champlain epoch thess arid plains were covered with immenss sheets of water, of which the existing ealine lakes are ths isolated rssidues. Hence it follows that the extreme dryness of climats now existing in thess regions did not always prsvail. Since tbe ahove-mantioned geological epoch there has been an increasing dryness of chmate over the whole of ths great basin. Is it still progressing, or has it reached its maximum of aridity? Is the great cycle of humidity returning upon these desert plains, and will they once more be clothed with vegetation at some future period? These are important questions in rslation to the future of tbs Pacific States.

There are certainly many evidences that during the past 25 years there has been a decided increase of rainfall and snowfall over a largs portion of ths great basin. Great Salt lake is known to have risen 14 feet witbin the last 25 years, thereby suhmerging large tracts of land on its flat margins; and chemical analyses show that its waters are progressively freshing. According to the ohservations of Clarence King, during only four years (1867-71) Pyramid lake has risen nine feet, and Winnemucca lake 22 feet within the same short period. In like manner Mono lake has risen 10 or 12 feet during the last 15 yeare. Tbe same ie said to be true of Walker's lake and of Owen'e lake. Additional evidence of tbe increasing snowfall in tbe Sierra Nevada is afforded by the fact that the glacial masses, which cover the flanks of its lofty mountain peake, seem to he advancing on the footbills. It would seem, therefore, that the rise of the lakes occupying the great hasin ie undouhtedly the result of a climatic cycle.

The momentous question for the future prosperity of the Pacific States is wbether the cycle is to he a long or short one; whether it is to he a geological cycle of augmenting rainfall and snowfall constituting a secular change of climate; or whether it ie to be only a climatic fluctuation of euch ehort duration ae to exerciee no appreciable influence or development of tbe vegetable and animal kingdoms.

Thie vital question cennot, from the want of sufficient deta, be answered at the present time. Our successors will, without doubt, he ahle after the lapss of sufficient tims to accumulats accurately-observed facts numerous enough to warrant the deduction of trustworthy conclusions.

Salmon River Country.

A Rich Country Suffering for Want of Machinery.

Ths East Fork mining district 55 miles south of Chellis, says the Salt Lake *Tribune*, is the continuation of the Bay Horse mining belt. In view of the many prospectors and others emigrating to the nortb, many of whom are settling in the Salmou River conntry, the general cher-acteristics of the section mey bs interesting, leaving the mines for future notice. It was hers in this district that tbe gap was closed in September of last year, thus making it, in connection with the Bay Horse helt, the longest known. Ths Wood River district, soutb of the East Fork, had heen prospected; the Kinni-kinnick eection on the north had bssn ths ecens of activity, but notwithstanding these facts it took all the summer of 1879 to detsrmine which direction the mineral helt ran. The discovery of the old Bible Back, Germanie, Warsaw and Independent ledgee afforded the solution of the prohlem and settled the direction hsyond all cavil. Subsequently the Alta, Kernac and Arctic lodss were located, forming a group of prospects, all carrying very high grade ores. The averags of tho whole East Fork district will he about 150 ounces to tho ton. Some of the rock, in fact, considerahls of it, carries ovsr 500 ounces, and ths lowest grade rock, taksn from any of tbs ledges, asseyed 60 ounces. The Eest Fork and Wood river head close together, in tbe same range, the outlst for ths ores from the formsr heing Wood river.

Owing to the East Fork district bsing situate close hy or upon ths boundary lins separating Alturas from Lemhi county, most of the locations made in East Fork havs besn recorded in Lsmhi.

Lumber is fonnd in great quantity, all kinds of pinss and euch trees as would bs naturally indigenous to ths country. The mill eites are countless, any number hsing found in tho district. The ores are smslting.

In Wood River district a town called Galena has been estahlished, being some 20 miles from the East Fork district. Doubtless it will hecome the headquarters for the Wood River aud East Fork mines. The ledges found at the head of Wood River havs not been developsd, and while the ledges ars emall, comparetively speaking, the grade of tbe ore, together with the position of the ledges, easily accssshle to the minss, render the properties very valuable. This district, liks the East Fork, is described to ue hy an enthusiastic admirsr of the country as "the miner's peradise." On both sides of the Wood River valley there have heen found high grade smelting ores for a distancs of 40 miles. Every few miles in the long vallsy, lerge creeks, abounding in trout, put in. Timher is as plsnty as in the Bay Horse district.

Frrther down, near the crossing of the old Boise road is the site of Jacob city. The mines situated in the vicinity of Warm Springs Creek, near Jacoh city, many of wbich are incorporated, are of ths same grade and character as the ores found in the upper camp and East Fork.

Camas prairis ie heing rapidly settled up by farmers, and ths influx of emigrante does not diminish. It is certainly one of the most magnificent agriculturel and stock-raising countriss to he found in the land. By the 4th of next July, good judges are free to express ths opinion, ths geography of thie portion of Idaho will be materially changed.

There is one drawhack to the rapid booming of the country at present, ths ahsence of all macbinery to reduce ths ores, and miners who are contemplating a departure into this district in hopes of bettering themselves and gaining a livelihood, should keep the fact wsll in mind. This cause operating there is no market tor the ores, and for several months, the Salmon river country will be a consumer. It is, however, a good country to stay with because of the extraordinary ore, of a very high grads, its numerous ledges and tbe facility for working them. These reasons will place this section among the foremost mining regions.

The Utah & Northern railroad taps this section within 150 miles and the probabilitiss ars that before fall a branch road will hs built from the Portneuf canyon across the lava heds to ths foothills, thence down tbo old Boiss road to Boise, and thsn on to Portland, Orsgon. The completion of this road will of course enhance tbe value of all kinds of properties, as machinery can readily be secured.

Gold in India.—The latest English advices speak of thc excitement over gold discoveries in southern India ae unahated. Some of the nugget storiee remind one of the earlier days of the California craze and in the district of Nevada. For instance, we read of pieces of gold as large ae a man's hand found in the Pandi river, and on the slope of Needle Rock range, nuggets as hig as two bands could compass. On the Pandi river, below Perishota crossing, layers of gold an inch thick have heen bronght to light. A column might be fillod up with eimilar statements.

The Engineer.

The Proposed Maryland Ship Canal.

The Congressional Committee, to whom was referred the matter of the proposed Maryland ship canal, will, in their forthcoming report, recommend the route across the peninsula, leaving the Chesapeake bay at Queenstowu, Md., and running across to Lewes, Del., discharging into Delaware bay five miles above the Delaware breakwater. The length of the canal by this route will be 51 miles. It will be 200 feet wide and 25 feet deep, and capable of accommodating the largest class of vessels. Its width will enable two of the largest steamships or sailing vessels in tow to pass each other with ease. There is no natural waterway, the entire line being excavated. In answer to objections, the report states that the canal is to be used by day or night, and will have no toll charges. It is proposed to have no locks other than tide locks. The report recommends an appropriation of $37,000,000, which is allowing a margin of $6,000,000; as from close and authentic calculations it is believed the canal by the route recommended can be built for $31,000,000. The advantages to foreign commerce are apparent. Vessels bound to any European port north of the Mediterranean can, by going through the canal, save 225 miles, which would otherwise be consumed in sailing down the Chesapeake bay and round the capes. This would make the trips of the regular foreign lines of steamships nearly two days shorter, and would in a similar manner expedite irregular marine traffic. The most important feature of the report is that it recommends that the canal be built under the supervision of the War Department, to serve the combined objects of harbor defence and an aid to commerce. Col. Kimmel, while serving on the Naval Committee, obtained an idea of harbor defence, on which he bases this part of his report. It argues that in the naval equipment of this country there should be two classes of vessels—one for "harbor defence," and the other "commerce destroyers."

Catamaran for Fast Passenger Travel on the Hudson.—A late number of the New York *Graphic* gives an illustration of a novel steamboat now building at Nyack, under the superintendence of Mr. Wm. Voorhis, of that place, formerly Commodore of the New York Yacht Club. The new boat is to be in the form of a catamaran, and it is expected that she will exceed in speed any ever constructed. She will have a double hull, 200 feet in length, while, as a whole, she will have 25 feet beam. Her engines will be of a pattern suited to the character of the craft, and turn a single wheel—to be placed between the parts of the double hull—of 8 feet in diameter, at the rate of 325 revolutions per minute. It should be mentioned that her hull, or, rather, hulls, are to be of iron, each 5 feet six inches in diameter and cigar shape. Of course it will be understood that she will have no cabins below the water as in the ordinary steamboat. On account of the peculiar boiler, Mr. Voorhis expects to be able, with perfect safety, to carry 125 pounds of steam to the square inch, whereas the common boats rarely exceed from 30 to 35 pounds. Great speed is expected to result from the following considerations: From the length and narrowness of the engine cylinders, giving great speed to the machinery, and from the shallow draft of water, the draft amidships being less than 3 feet and gradually diminishing to nothing fore and aft. In proportion to her displacement no other boat has one-third the power this novel steamer will possess. It is intended to use her as a passenger boat, and her carrying capacity will be 73 tons or about 500 passengers. She will have four bulkheads, comprising five air-tight compartments, which will be placed 9 feet apart, and the deck over her center will be 125 feet long, including a saloon of the same length and as wide as the vessel itself. In case Mr. Voorhis' new nautical venture turns out to be the great success which be anticipates, the so-called fast boats of the day will have to retire on their records and make way for the new era in steamboating on the historic Hudson.

Improving the Upper Mississippi.—There is a proposal before a Congressional committee to form large reservoirs on the head waters of the Mississippi, the water from which may be used to maintain the river at a navigable depth at all times. The St. Louis *Globe*, of March 27th, suggests that the reservoirs required already exist in the great lakes on the northern boundary, and that a canal connecting the head waters with the lower end of Lake Michigan, and large enough to sensibly affect the depth of water in the river as far down as Cairo, is quite practicable. A third suggestion is to so fence the banks of the river as to prevent the milkmen from having access to it.

There is more mining being done in Fresno at present, and more money is being taken out, than at any time during the past 15 years. Old abandoned ravines and gravel banks are being worked, and thousands of dollars are being extracted from them, while a number of quartz veins are being made to yield up their golden treasure. The mining future of Fresno county is looking very bright.

Useful Information.

Why Axle-Boxes Become Loose.

It has often been a question in the minds of many interested in using vehicles, as well as those who make or repair them, why an axle-box should become loose. This not only occurs upon vehicles which have been run for some time, but also frequently upon new carriages or wagons. There are several causes to which it may be attributed.

When a box becomes loose upon a new vehicle it is either the result of undue strain produced by the box becoming "set" upon the arm, or the hub having been green or not thoroughly seasoned when the box was set. An improperly-set box in a well-seasoned hub will not be likely to develop signs of poor workmanship so readily, as, having been tightened by wedges, it requires time and considerable usage to become loosened; but in vehicles that have been run for some time, a loose box indicates one that has been improperly set.

There is no reason why a box should become loose until worn out, and not even then if it has been properly set and was never strained by the axle-arm having become heated.

Many workmen pride themselves upon the rapidity with which they "box a set of wheels." The desire to excel in this particular often leads to faulty workmanship. If chiseled out with a gouge, there is frequently too much wood cut from the center of the hub, leaving but a small portion of the timber that forms the front end to hug the box; to tighten the back end, the sole dependence is placed upon the wedges used. The result is naturally a loose box.

The same difficulty frequently occurs even when a box-setting machine is used. I therefore would discourage the use of wedges for the purpose of tightening a box. It is a bad custom, that not only injures the hub, but covers imperfectly a faulty piece of workmanship. If, in a hub that is thoroughly seasoned, a hole of the proper size and shape is chiseled or cut out by the aid of a machine, as a receptacle for the box, which must be properly driven (white lead, mixed to the consistency of paste, being used as a cement to hold it), no wedging is required and no trouble will be experienced from the boxes becoming loosened. In order to do this properly the tire must be set with care and well trued, because, no wedges having been used, there is no opportunity for "truing the box" after having been driven. As I have remarked before, there is no reason why a box should become loose unless it is imperfectly set. It sustains no strain save, as stated before, in cases where the arm becomes heated. Although I make use above of the word "driven," boxes should rather be *pressed* in, as there is less liability of breakage. When this is done, the result is far more satisfactory than can be obtained by the use of wedges.—*Blacksmith and Wheelwright.*

Hints Concerning Saws.—A saw just large enough to cut through a board will require less power than a saw larger, the number of teeth, speed and thickness being equal in each. The more teeth, the more power, provided the thickness, speed and feed are equal. There is, however, a limit, or point where a few teeth will not answer the place of a large number. The thinner the saw, the more teeth will be required to carry an equal amount of feed to each revolution of the saw, but always at an expense of power. When bench saws are used, and the sawing is done by a gauge, the lumber is often inclined to clatter and raise up the back of the saw, when pushed hard. The reason is that the back half of the saw, having an upward motion, has a tendency to lift and raise the piece being sawn, especially when it springs and pinches on the saw, or crowds between the saw and gauge, while the cut at the front of the saw has the opposite tendency of holding that part of the piece down. The hook or pitch of a saw-tooth should be on a line from one-quarter to one-fifth the diameter of the saw; a one-quarter pitch is mostly used for hard, and a one-fifth for softer timber. For very fine-toothed saws designed for heavy work, such as sawing shingles, etc., even from soft wood, one-quarter pitch is best.

Hours and Minutes.—Why is one hour divided into sixty minutes? and each minute again into sixty seconds? Why not divide our time as we do our money, by tens, counting ten, or fifty, or one hundred minutes to an hour? This question was asked by an intelligent boy a few days since; and the answer given him may both interest and instruct other young people. The answer is this: We have sixty divisions on the dials of our clocks and watches, because the old Greek astronomer, Hipparchus, who lived in the second century before Christ, accepted the Babylonian system of reckoning time, that system being sexigesimal. The Babyloniane were acquainted with the decimal system; but for common and practical purposes, they counted by *sossi* and *sari*, the *sosses* representing sixty, and the *sares*, sixty times sixty, is thirty-six hundred. From Hipparchus, that mode of reckoning found its way into the works of Ptolemy, about 150 A. D., and hence was carried down the stream of science and civilization, and found the way to our dial plates of our clocks and watches.—*Selected.*

The Use of Glue.—Wheelwrights and others who use glue should remember that fresh glue dries much faster than that which has been once or twice melted. Dry glue, steeped in cold water, absorbs different quantities of water, according to the quality of the glue, while the proportion of the water so absorbed may be used as a test of the quality of the glue. From careful experiments with dry glue, immersed for 24 hours in water at 60° Fah., and thereby transformed into a jelly, it has been found that the finest ordinary glue, or that made from white bones, absorbs 12 times its weight of water in 24 hours; from dark bones, the glue absorbs nine times its weight of water; while the ordinary glue, made from animal refuse, absorbs but three to five times its weight of water.

Chemical science has recently succeeded in extracting the coloring matter from human hair. Diluted sulphuric acid is found to be the best solvent, and there appear to be three coloring pigments—yellow, red and black—all the shades being also produced by the mixture. It seems that in pure golden yellow hair, there is only the yellow pigment; in red hair, the red pigment is mixed with more or less yellow, producing the various shades of red and orange; in dark hair, the black is always mixed with yellow and red, but the latter are overpowered by the black—it appearing that even the blackest hair, such as that of the negro, contains as much red pigment as the very reddest hair.

To Remove Fruit and Wine Stains.—The following is a recipe worth trying for removing fruit and wine stains, especially peach and claret, from table linen: If uncolored, moisten with dilute sulphuric acid and then rub with a strong aqueous solution of sulphite or hyposulphite of soda; or soak for a short time in a strong aqueous solution of bleaching powder (calcium hypochlorite), press out excess of the liquid, and immerse in dilute sulphuric acid (1 to 10 of water); rinse in cold water, dip in hyposulphite of soda solution, and afterward wash out thoroughly in hot water. If colored, use plenty of soap-suds and ammonia water.

The introduction of magnets into all the great flouring mills has been a revelation to the millers who complained of wire in wheat. Not only have the magnets captured all the stray pieces of iron bands, and thus removed the last objection urged against iron-binding harvesters, but they have revealed the startling fact, that, of the scraps of iron and steel that find their way to the mill mixed with wheat, fully one-half are something besides pieces of wire, and of such a nature as to be even more dangerous to the mill machinery.

Coloring Brass Work.—Cleaned-up brass work, if left in damp sand, is said to acquire a fine brown color, which, when polished with a dry brush, remains permanent and requires little cleaning. Black, much used for optical brass work, is obtained by coating the brass with a solution of platinum, or with chloride of gold mixed with nitrate of tin. The Japanese are said to bronze their brass by boiling it in a solution of sulphate of copper, alum, and verdigris.

Good Health.

The Use of Condiments.

The general definition of this word is, "a pungent and appetizing substance, as pepper or mustard; seasoning. Something used to give relish to food and to gratify the taste." To the question, why do you use pepper on your food? you reply, because you relish the taste of the pepper. A little thought will, perhaps, convince you that you mistake its use. Is it not more probable that the addition of condiments brings out the flavor of the article of food on which it is placed. As a general thing pepper and mustard are not used on the fruits. Carrying out this view, if condiments are used simply to bring out fully the latent flavor of the dish, they could with equal propriety be used on fruit. This is, in fact, the case. To convince yourself of this, use pepper on strawberries, and you will find in them a flavor more delicious than you have ever experienced before. You will further discover that in this case you have not used the pepper for its taste.

The use of salt is as improperly understood. It is a natural preservative when applied to animal substances. The acid in the salt being the preservative element. When used with vegetable food, but not in such quantities as to cause a salty taste, it is a great improvement. In boiling corn or oatmeal without adding a little salt at first will cause it to have a bitter if not unpleasant taste. The addition of salt removes this rank taste and gives the appearance of smoothness. This is caused by the chemical action of the acid in the salt on the farina or starch.

We use pepper and mustard on food for the purpose of bringing out the flavor of the article on which it is placed. So with salt. A good test of this is boiled rice, which is perfectly insipid without the addition of salt. Many people prefer it flavored with sugar. It will be found that when sugar is used it will be far more pleasant and agreeable to the taste if it had been previously seasoned with salt, although not strong enough to detect the taste.

Climate and Complexion.—There is a great diversity of opinion as to the reason of the differences of complexion to be observed among mankind. Roughly speaking, the hue of the skin varies with the latitude. The fairer races having their homes at a distance from the equator; the darker, within or near the tropics. This fact would seem to point to the position of the sun with reference to those on whom he shines as the cause. But the question presents difficulties which this supposition does not aid us to solve. At the same distance from the equator we find the fair Englishman, the yellow Mongol, and the copper-colored Indian. To the north of the white Russian and Finn live the swarthy Lapp and Samoyed. North of the Caucasus are dark-skinned Tartars, south of it fair-complexioned Circassians. The aborigines of America vary less in color than the natives of the Old World. None of them are as fair as the Swede, none as black as the negro of Congo, and those living in Brazil, on the equator, are not the darkest. There are blacker men in Australia and New Guinea than in Borneo and Sumatra, though these islands are on the equator and those are not. The Shilleoks of the Upper Nile, who live about 10° north latitude, are blacker than the Monbuttoo, who are six degs. farther south.—*Popular Science Monthly.*

A surfeit in man is called founder in a horse, and is over-eating, eating more than the stomach can possibly convert into healthful blood. Wise men, and careful men will sometimes inadvertently eat to much, known by a feeling of fullness, of unrest, of a discomfort which pervades the whole man. Under such circumstances, we want to do something for relief; some eat a pickle, others swallow a little vinegar, a large number drink brandy. We have swallowed too much, the system is oppressed, and nature rebels, instinct comes to the rescue, and takes away all appetite, to prevent our adding to the burden by a morsel or a drop. The very safest, surest and least hurtful remedy, is to walk briskly in the open air, rain or shine, sun, hail, or hurricane, until there is a very slight moisture on the skin, then regulate the gait, so as to keep the perspiration at that point, until entire relief is afforded, indicated by a general abatement of the discomfort; but as violence has been offered to the stomach, and it has been wearied with the extra burden imposed upon it, the next regular meal should be omitted altogether. Such a course will prevent many a sick hour, many a cramp, colic, many a fatal diarrhœa.—*Hall's Journal of Health.*

The Secret of Beauty.—The true secret of beauty is health. Those who desire to be beautiful should do all they can to restore their health, if they have it yet. No one can lay down specific rules for other people in these matters. The work one may do, the rest he must take, his baths, diet and exercise, are matters of individual consideration, but they must be carefully thought of and never neglected. As a rule, when a person looks well he feels well, and when he looks bad he feels bad, as a general thing. There are times when one could guess, without looking in the glass, that his eyes were dull and his skin was mottled. This is not a case for something in a pretty bottle from the perfumer's, or for the lotion the circulars praise so highly. To have a fresh complexion and bright eyes, even to have white hands and a graceful figure, you must be well. Health, and the happiness that usually comes with it, are the true secrets of beauty.—*Quarterly Review.*

Petroleum for Coughs.—Dr. Moubre, writing to the *Gazette des Hopitaux*, gives his experience of petroleum capsules in simple and chronic bronchitis. This balsamic had been brought before the Therapeutic Society by Dr. Blache a year ago, at the suggestion of a Paris chemist, who named it Gabian oil, in order to prevent public prejudice. Each capsule contains 25 centigrammes of pure petroleum, the ordinary oil not being used, as it has to be distilled in contact with sulphuric acid to render it fit for lighting purposes. At the Hopital Beaujon, where these capsules have been freely ordered for chronic bronchitis, a rapid diminution of the secretion and fits of coughing were observed. In tuberculosis this medicine gave encouraging results.

A Fatal Italian Disease.—An Italian correspondent of the *Lancet* calls attention to an insidious and frightfully fatal disease called "pellagra," of which no less than 97,000 Italians are said to be dying, at the present time, the number of victims representing 3.62 per 1,000 of the whole population, and in the infected departments, especially in Lombardy and Venice, a higher proportion than ever occurred during the worst cholera epidemic in France. The disease usually runs a slow course, like consumption. Its cause is believed to be the exclusive consumption of maize in a deteriorated condition and the unhealthy state of the hovels in which the rustics live.

Sudden Death from Electric Shock.—A serious illustration of the risk attending electric shocks, even when apparently slight, occurred recently in New Haven, Conn. A gentleman was induced to try a shock, "just for fun," from the machine of an itinerant peddler of electricity. He turned away, but had not gone far when he was seen to stagger and fall. He was picked up unconscious, and remained so until he died, two days after. The physicians pronounced it a case of apoplexy, superinduced by the electric shock.

Improved Grounds for Sale—C. Fieldsted, San Jose, Cal.

The Week.

Our interior exchanges continue to record frequent discoveries and etrikee in variouе mines. Nearly all over the coast an era of prospecting has set in with the opening of spring. The pleasant weather which has prevailed ie melting off the snow in many places, and many minee have started np which have been retarded in their operations.

There is considerable talk just now of working the low-grade ores of the Comstock. Several yeare ago we contended that it was bad policy to gut the mines of their rich ore so as to get the greatest possible yield in the shortest possible time. A eystem of concentration should have been adopted long ago, and it is well that necessity is bringing the question forward more prominently. Working low-grade ore necessitates an economical management and the carrying on of work on etrict business principles. When this is done the Comstock will again hecome prominent. At the same time there is alwaye a chance for a bonanza.

In another column will be found a notice of a new proposition in relation to the mining laws, making a distinction between "blanket lodes" and ledgee. The subject has been brought np again in Congrese this week and is etill under discussion.

The Gunnison country, in Colorado, is still attracting great attention, and a "rnsh" there will no douht soon take place.

At a meeting of the Cabinet, lately, the threatened invasion of the Ute reservation for mining purposes was the snbject of a somewhat protracted discussion. It was decided to send Gen. McKenzie and his forces into the reservation, to prevent a collision between the whites and the Indians.

The Fort Meade Hydraulic Co., Dakota, are running a tunnel through the monntain 10x10, some 450 feet long. By eo doing they will be able to strike about 25 feet below bedrock on Rapid creek, which carries about 4,000 inches of water. When completed, the river will flow through this tunnel in two 4x4 flumes.

One hundreo and fifty placer miners, witbin ten miles to Prescott, Arizona, are taking out from $4 to $20 per day to the man.

Mechanics' Institute Fair of 1880.

The presnt year promises to be one of unsual activity in all onr productive indnstries, and, therefore, one of satisfaction to all who have the best interests of the State at heart. Recognizing this fact, we nnderstand that the managers of the Mechanics' Institnte, of this city, have resolved to put forth extra exertions to maks this year's exhibition a fitting exponent of the character of the year in our fields, our work shops and onr social and esthetic life. They have issned an annonncement which clearly outlines thsir pnrposes and their expectations, and in order to aid them in intsresting our readers wbo are engaged in the varions arts and indnstries, we pressnt the leading portions of their address to tbe people of ths Pacific coast. Successful and nsefnl as these exhibitions have been in former years, and favorable as their influence bas undonbtedly been on the various industries of the coast, it is believed that the Fifteenth will exceed all others in importance. The long night of depression and stagnation in the industrial world is now coming to an end, and already the signs of a bright dawn of prospsrity are ssen on every hand. Undsr these circumstances it bshooves every inventor, every merchant, every mannfacturer, to bestir himself, to make known ths nature of his specialty, to bring it under the direct notice of tbe public in an impressive manner, and above all, to give what guarantes he can of the excellence and superior quality thersof. To aid him in doing thess things, the Mechanics' Indnstrial fair offers nnequalled advantagas. The vast size of the pavilion, with its floor area of 190,000 square feet, its fins engine with free steam power, whereby inventors and mannfactnrers are snabled to exhibit their machines in actual operation, its ease of accass from all parts of ths city, by means of six lines of street cars, the immsnse multitudes of visitors, averaging 300,000 for each fair, from all parts of the coast—these together are inducements snch as can be found nowbere else west of Chicago.

It is hoped that ths awarding of premiums this year, oonsisting of gold, silver and bronze medals and diplomas, will be an additional inducement to exhibitore to pnt forth their best efforts, giving, ae they do, a gnarantee of merit, the value of which can scarcely he over-eetimated.

To visitors is offered a combination of attractions more than sufficient to well repay them for their ontlay. There will be gathered together the natural productions of the entire coast, examplee of the mannfacturing skill of our artisans, embodied thoughts from the brains of our inventors, the works of genius of our artists—an epitome, in fact, of all that man and nature combined bave done on the Pacific coast. For the pleasure seeker, pnre and eimple, a trained orchestra, nnder competent leadership, will disconree eweet music; while in the horticultnral garden, ferns and exotic plants, orange, lemon, and other snb-tropical trees, with a constantly renewed supply of beautiful cut flowers and fruits, will offer attractions of a not less pleasing kind.

One of the leading featnres of the fair will be the art department, wbere, in a spacione, well-lighted gallery, will be displayed the finest works of onr band of local artists, some of them of world-wide fame, with not a few gems from other lande and other times. Thie department has alwaye been eepecially interesting, aud no effort will be spared this year to make it worthily represent the art cnlture of the Pacific coast.

No charge of any kind is made to exhibitors for epace, steam or water. Goods arriving before the opening of the exhibition will be etored free of charge. Blank applications for space, a copy of the rnles and regulatione, premium list, and any other desired information, will be giveu on application to tbe Secretary, J. H. Culver, 27 Post etreet. Mr. J. H. Gilmore is Snperintendent. The Board of Managere is composed of tbe following gentlemen: P. B. Cornwall, President; A. W. Starbird, Vice-President; J. A. Bauer, Treasurer; A. L. Fish, C. Waterhonse, Jamee Drury, Nathaniel Hunter, F. A. Frank, David Kerr, Samuel Dnnsmore, J. R. Wilcox, Geo. H. Hopps, Edwin Fretwell and George Spanlding.

Speaking of the Skagit mines, the Victoria *Colonist* eaye: One miner has started to slnice, and exhibited to a vieitor quite a large quantity of coarse and fine gold which he bad jnet taken from the slnices. A company of miners, one of whom had been assisting Mr. Derley, offered him $10,000 for his claim. The offer was refnsed. Another miner reports that there are only about 150 men in the digginge all told, and they are waiting for the enow to melt. Some have set rockere on the eide hills, and when the snow starts to melt will go to work. The hills prospect well. Mr. Algar packed in quite a eupply of provisions, which he stowed away to be nsed when he goes back to work his claim in June. He says there are plenty of claims nntaken, but miners are now going in from both waye, and the ground is being rapidly taken np. Tbe eaw mill has been packed in as far as the month of Ruby creek, and will be at its destination in a few weeks more.

The Gold Hill *News* estimates that 5,000,000 gallone of water is being daily raised from the Comstock mines.

Arizona.—No. 2.

Facilitiee for Travel and Traneportation.

Befors the railroad was constrncted, ths journey from fort Ynma to Florence was both disagreeable and dangerous. The mountains to the south and southeast were the home of the fierce Apache, and roving bands of Mexicans, crossing the border from Sonora, frequently robbed and murdsred travelers along this route.

On three occasions, the stage was stoppsd by a single bold bandit, Brazelton by name. A story is told to ths effect that a passengsr who had bsard of a previous robbery was extremely anxious that the driver should show him how and where it had occurred.

Approaching a grove of trees, the driver said: "Yon ses those trees yonder; it was among them that be was hidden; behind that very tree, and—by Jove—there he is again!"

"Yes, here I am again!" shonted the robber, leveling his shotgun, "and all of you throw up yonr hands!" Brazelton was killed by a deputy-sheriff and posse, soon aftsr. His whsrsabouts were discovered by means of an accomplice, and he was riddled with bullets befors he could respond. He carried a perfect arsenal of firsarms.

But the Apache, tbe Mexican cnt-tbroat and the road-agsnt wsre not the only amenities of the road. The only conveyancss were lumbering wagon-like stages and "jerkies," in which the passengers, crowded together so that they could scarcely move a limb, endnred for three days and thrse nights the pelting heat and drifting clouds of sand. So great is the abrading power of this continuons sand-blast, that already soms of the telegraph poles are partially cut by it.

In thoss ante-railway times every ton of ore forwarded from the Pioneer distriot cost $100 bsfore it was landed in San Francisco. But before many months the Sonthern Pacific will be completed to the San Pedro, where, at a fnture town, whicb has alrsady bsen named Benson, about eight milss south of the Pres Alamos, a very largs proportion of the ore of southsrn Arizona, including that of the rich Tombstone and Hnachuca districts, will be shippsd for San Francisco, and a vsry large part of the supplies for the mines and snrrounding agricultnral districts will be landed.

It is probable that the Atchison, Topeka and Santa Fe railroad will ultimately join the Southern Pacific near Tucson, passing northward thence through the valley of Gold Caoyon creek, by old Camp Grant and along the San Pedro to the Gila, thence along the Gila canyon to San Carlos and northeastward to Fort Apache, St. John in the Little Colorado valley, aud Zuni. The traffic of northern Arizona reaches and leaves the Southern Pacific at Maricopa Wells, where there is a large depot and freight-house. A company has been formed, under the name of the Arizona Central Railway Co., to build a railroad, owned in the Territory, from Maricopa to Phœnix, and thence to Prescott. From Maricopa to Phœnix this will pass over a perfectly level oountry.

From San Francisco to Fort Yuma along the railroad the distance is 730.9 miles, from thence to Maricopa 156.3 miles, from thence to Tucson 91.2 miles, and from Tucson to the futore town of Benson 46 miles. The total length of the track of the South Pacific railroad in the Territory is 383.3 miles. The proposed route of the Atchison, Topeka and Santa Fe will give Arizona about 240 miles of the iron track, while the Arizona Central will nave a length of about 130 milee, making a total of about 753 miles in the Territory.

Fort Verde, Prescott, Wickenburg, Phœnix, Maricopa, Camp McDowell, Florence, Tncson, Fort Bowie, Camp Tbomas and Fort Apache are connected by the U. S. military telegraph.

The Southern Pacific was opened to Yuma on October 20, 1877, to Maricopa April 28, 1878, and to Tncson on or about March 24, 1880. The traveler, leaving San Francisco at 4 P. M. on Monday, reachee Los Angeles at 1:55 P. M. on Tuesday, and Tncson at 11:55 on Wednesday. The fare to Tucson is $69 first, $59 second and $49 third class.

Hietory and Antiquities.

The early history of Arizona hae still to be written, but it is in moet reepects identical with that of southern California, New Mexico and northern Mexico. That the original inhabitante belonged to the same civilization as that under which Mexico rose to eo comparatively high a grade long before Cortee landed on its ehores, is usnally conceded, but whether the bulk of the people removed southward toward the coneolidated empire of the Aztecs before the conquest of Mexico by the Spaniards; whether they remained and were swept away by the Spanish invasion from the eouth; or whether the Apache from the north drove them out of the open lands into the recesses of the canyons, and finally extinguished all bnt the few pueblos still remaining, is not certainly proven.

Probably the truth lies between the three alternatives, and all the canses may have contribnted to the depopulation of the country and to the ruin of the extensive cities, dwellings, canals, etc., which strew the plains and line the sides of the canyons. To the stndent of history nothing in Arizona eqnals in interest these architectnral remains. Now that the railway is finished, many of these are comparatively accessible—the famons Casa Grande being only a few miles from the station of that name, while numeroue other rnins exist in the districts around Florence and Phœnix.

A few miles from Phœnix are the ruins of two or three towns and the remains of two stupsndons canals, one of which is 40 fset wide, and in former times drsw its supply of water from the river nsar the monntains, 20 miles distant. In this neighborhood are also the ruins of a bnilding occupying a parallelogram of 26 feet by 130, with walls still over 10 fest high. At from 12 to 14 miles of Phœnix, at La Tempe, are remains of what mnst have besn a popnlons city, and also anotbsr system of canals and reservoirs. Ruins of a similar dscription to those of Casa Grande have besn found in the Rio Verde valley, on Pueblo creek and at Aztec pass.

Casa Grande, discovered by Father Kino, 300 years ago, is situated near the Gila, a few milse from Florence. The main bnilding is about 55 feet square, and four stories in hight, witb traces of two more stories. Eacb story contains five rooms, two 35x10 feet, the other three 24x 9 feet, and all of them nine feet in hight. The opsnings which once ssrved for doors ere three feet and one-half bigh, two and one-half feet wide at the base, and two feet wide at top. The whole of the intsrior is neatly plastered, the plaster perfect as when first put on. This building is surrounded by a wall, whicb, when perfect, was perhaps 15 fest high, and six fest thick at the hass, and within this are ssveral smaller apartments, bsides a sort of watch tower at the soutbeast and sontbwest corners.

The towns of the Moqni and Znni, the former in tbe north of Arizona, and the latter just over the border in New Mexico, are in so many respects similar to the ruins scattsred on plain and canyon, that they svidently bslong to the same civilization; but whether the Indians are the remains of a separate tribs, or the remnants of many tribes is one of the problems of the history of America.

In the Gila valley, 120 miles from Tucson, are the famous Pisdras Pintadas. A heap of rocks, about 50 fsst high, is coversd with rude figures, geometric, comio, anatomical. Here are sqnares, circles, crosses, triangles, snakes, toads and vermin; men without heads and dogs without tails. The sketches show considerable similarity to those of ths Aztec Calendar Stone in Mexico. It is a tradition with the Indians that those stones were put there in the time of Montezuma to record treaties bstween different tribss.

The "Indians" of Arizona evidently belong to sevsral very diffsrent stocks. The wild Apache, formidable for his stealthiness and treachery more than from his unmbers; the peaceful, not easily provoked, yet brave Pimo; the indnstrioue Papago; and the town-dwelling, family-loving, orderly, clean and self-contained Mogui, have little in common. The distance which separatcs the rude Apache from the Moqui, with hie old and reepectable civilization, is as great as that between the rude tribes of Siberia aod the cultivated Japanese.

The ruins in the canyons, on almost inaccessible terracee, are believed, by Major Powell, to be more recent than those of the plains. He helieves the peoplo took refuge there to escape the Spanish incnrsions.

Early Mining.

In an old Spanisb work, entitled "Apostolio Labore of the Society of Jesus," the finding of gold and silver in the Santa Rita mountains is thus narrated:

"In the year 1769, a region of virgin silver wae discovered on the frontier of the Apaohes, a trihe exceedingly war-like and brave, at the place called Arizona, on a mountain ridge which hath been named by its discoverers Santa Rita. The discovery was made known by a Yaqui Indian, who revealed it to a trader of Durango, and the latter made it public. Newe of such surprising wealth attracted a vast multitude to the epot. At a depth of a few varas masses of pure silver were found, of a globular form and one or two arrobas in weight. Several pieces were taken out weighing upward of 20 arrobas; one found by an inferior official attached to the government of Guadalajara weighed 140 arrobas. (An arroba is 25 pounds.) Many persons amassed large sums; wbilst others, though diligent and persevering, found little or nothing. For the security of thie mass of treasure, the captain of the Presidio of Altar sent troops, who escorted the greater bulk of this silver to headquarters, whereupon this officer seized the treasnre as being the property of the crown.

"In vain the finders protested against this treatment, and appealed to the audience chamber at Gnadalajara, but for answer the authorities referred the matter to the court of Madrid. At the end of seven years the king made the decision, which was that tbe silver pertained to hie royal treasury, and ordered that thenceforth the mines should be worked for hie benefit. This decree, together witb the incessant attacks of the hostile Indians, so discouraged the treasnrehnnters that the mines were abandoned, as needs must be until these savages are exterminated." From that day nntil within the laet few years the Apaches finally beat off all those who penetrated into their land in search of gold.

South-east of the pnehlo of Tubao the Jesuit padres erected the Mission Tumecarori, almost in the beart of the Apache country, and there cultivated sanctity and the pursuit of worldly riches with much snccese for a while; but one day the red man surrounded the building witb fire and knife, and not a padre lived to tell the story. All the tribes of the Apacbes, whether Coyetero, Tonto, Chiricahna or Moggolone, were united in the endeavor to keep from the sight of the white invader the riches of southern Arizona.

Fraser river canneries are running on full time.

El Capitan—Yosemite Valley.

We give herewith a spirited view of one of the gate-posts at the entrance to that most wnnderful of all the mountain valleys of ths world, the Yosemite. This stnpondous mass of naked granite is known as El Capitan. Directly opposite, bnt not shown in our engraving, are the Cathedral rocks; the two forming the gateway nr entrance to the vallsy beyond. The space between these great masses nf rock comprises the nsrrowest portion of ths valley, and thrnugh it runs the Msrced river. Whether the visitor snters the valley by way nf ths Conlterville ronte from the north, or by that from Mariposa nn the south, the first and most prominent nhjsct which msets the eye, as he dosconds from the mountain, is the towering mass of El Capitan, rising above the floor of ths valley abont 3,300 fcst, with an almost perpendicnlar ascent. The sides nr walls are bare, smooth and entirely destitnte nf vsgetation, presenting at the top a sharp, olearly defined edge, with here and there a stunted tres standing out in wsird and sharp relisf against the blue sky beyund.

It is difficnlt, even while viewing this hugs mass nf granite, to form anything like an adequate idea nf eithsr its bulk or hight. Thsre are nthsr points in the vallsy which are of greater altitnde, hnt nothing which an impresses the beholdsr with its immonsity and grandeur. This effsct is produced by the boldness with which it stands ont from the mountain mass nf which it forms a portion. There is probably no othsr instance, on any largs scale, whers a section of an immsnse mountain is sn fully isolatsd and so completely exposed to view from crown to base.

Many nf nur readers have sesn Bunksr Hill monument, an immsnse granite obelisk, 220 feet high. It wonld take fifteen such struotnres, piled ons npon the other, to reaoh the summit of El Capitan.

The Indian nams of this rock is *Totokamula*. Sevsral interprstations nf that name have been given, one of which says the sonnd of the word is in imitation of ths ory nf the crans, beoause in winter that bird usually flies over this rock as it entsrs the valley from the snowy regions above and bsyond. A seemingly more appropriate signification is that this Indian term signifies El Capitan, or, as we might say, "the higgest fellow of them all." Whitney, in his Yosemite guids book, says, it "seems as if hewed from the mountain on pnrposs to stand as a typs of eternal massiveness. It is donhtful if anywhers in the world there is pressnted so squarsly cut, so lofty and so imposing a face of rock."

The Yosemite vallsy is fast becoming the Msoca of all pilgrimages tn the Pacific coast. There is something there hesides towering cliffs and mountain torrents lsaping from dizzy hights—something more and beynnd these and all the other myriad charms of mutely creeping river, mirrored lake and overarching boughs nf tangled wood. There is a grandenr in its bsanty which is found no whsre else on earth. The visitor is impressed with a subtle, mysterious, indescrihabls fesling of awe, which, howevsr much he has traveled, he has nevsr met with elsewhers. While in this valley, the cares and business of the world sesm as completely shut out from the mind as though we were transplantsd to some nsw and grander sphers—to some world beyond this lower earth. All powers of description seem powerlsss to portray the immensity of the scenes which meet ths eys on every side.

Nature in its grandest aspects may he studied here. The geologist finds hsre ampls room for the highsst powers of scientific investigation in his particular line. Quite a number of scientists have studied and writtsn and published the results of their investigations; but, ths writer ventures the opinion, that John Muir has more rightly than any othsr interpreted the mode of nperation by which ths Grent Landscaps Builder has carved nut this wonderful valley of the Sierras. According to his interpretation of the writing upon these grand old colossnl walls, the glacier—that great plow nf the Almighty—has left its mark upon both the wall and floor of the valley in a manner too plain to be ignored. The fanciful idea nf volcanic disturhance and snbsidence seems tn have littls weight in the minds nf scientific men since the publication nf John Muir's letters from the Yosemite.

The Yo-emits valley is a unique and wonderful locality; it is an except onal creation, aud as suoh has been exceptionally and most appropriately provided for, jointly, hy hnth the State and nstion. It has been made and declared a nntionsl public park, snd placed under the immediats charge of the State nf California. The State, through its Legislature, has assumed ths responsibility of the charge, and has solemnly prnmised tn care for it, and hold it "iusliensable for all time," for the henefit nf the people, and for "public use, resort snd pleasure." The nnmber of visitors is annually increasing; but with that increase there seems to bs also a growing addition to those vexatious restraints and annoying charges, which are sn universal at nearly sll placos of great rsort. If the Stato would have this place "a joy forsver," a more liberal policy should be inaugurated. Every trail, road and bridge should hs free. Guide hoards should bs erected at evsry needed point for ths full information of visitors, to the end that every reasonable fscility should he offered for the fullest enjoyment of nature in this, one of her greatest resorts, altogether unrestrained except by the requirements of decency and order.

VIEW IN THE YOSEMITE—EL CAPITAN AT THE ENTRANCE TO THE VALLEY.

During the month of April the local incorporations declared dividends amounting in the aggregnte to $613,366; of this sum, $130,000 was paid by banks, $199,166 by gas and water companies, $44,000 by insurance companies, $35,500 by powder companies, $5,000 by railroad companies, and $279,700 by mining companies. In April, 1879, dividends amounted to $733,666.

Academy of Sciences.

At the regular ssmi-monthly mesting of the California Acsdomy of Sciences, on Monday evening last, Mr. Hsrmann Wenzsll exhibited his system of pneumatic clocks, by which tims is transmitted to any numbsr of sympathotic clocks within a modsrate area, by means of ths pulsating pressnre upon the column nf air confined in small tubes. Hs described tho various difficultiss enconntsred in its dsvelopment, nntil hs finally applied the principle of mechanical clock-work, nsed to operate a lever acting on a syphon, immorsed in glycerins. His great difficulty wss to overcomo the contraction and expansion of the column of air in the tube, and the glycsrine in the jars of the pnmp. This hs now claims to have dons, to a reasonable extent, sufficient for ordinary practical use in buildings, but not for use, it is thought, at any very great distances. In each immediats neighhorhood a regulator clock would bs required to direct twenty, or thirty or fifty dependent dials. Ths west wing of ths City Hall is furnished with them, while ths east wing has electric clocks. Ths pneumatic pipes should he placed inside the walls when houses are built, although thcy can bs added afterward, but not as well, and ars liahle to the same risk of leakage as gas and water pipes, with this additional inconvenience, that any lcakage would at once impair the correct action of the connecting dinl. They have this advantage, that one good regulator clock, with a long pendulum, in a building, will regulate and propel a nnmber of dials in its several rooms, and no ticking his heard, except hy the regulator, which requirss winding once a week. By means of models ths workings of the systsm were explained. Mr. Wenzell stated that he had been ab'e to drive clocks with air tubes two miles in length. In his explanations he took occasion to doubt the accuraoy of electrio clocks.

In ths discussion which ensued, Prof. Davidson, ths President of the Acadsmy, stated that in his npinion the elasticity of ths column of air employed as n medium, was a fatal objection to the uso of ths pnsumatic clock for any scientific purposes. He thought the utmost limit of its use would not sxceed a couple of miles, and then with s result too inaccurate for exsct scientific obssrvstions. Hs said the electric clocks used by astronomicsl observatorios had run a year with a variation of only seven ssoonds, and clocks movod hy a current of electricity moving through a circuit of 7,200 miles, had only vnried one-tenth of a second in any one night. A part nf this smsll error is due to the time consumed in the trsnsit of ths electric fluid, small though it be. Throughout Europs, elsctrical clocks have been adopted and used in transmitting time from one obssrvatory to another, when calculating longitnds. Ths time is sent nll ovsr Great Britain daily at 1 P. M. from Greenwich observatory, and ths entire country uses identical time, without allowance for difference of longitude. The pneumatic pressurs is subject also to variation from two high and two low harometric tidss a day, which cannot be compsnsated nor guarded against. It may answer for keeping ordinary currsnt time in a building, hut can nsver be of uss for scientific or astronomical purposes. Prof. Davidson then described the electric clock system of Paris, where every clock is moved each second; and ths clocks of precision used by astronomers, whsrs a har of steel, weighing 53 pounds is movsd a quarter of an inch in its arc of vibration, thus giving a mors rapid and exsct result than ths usual electric clocks of commerce. It is necessary to obtain as short an impulss as possible for all clocks used in astronomical work. Mr. Molera said the publio clocks of Paris were about being so changed as to be regulated hereafter only once an hour by ths common electtic impulss from ths central regulator. Prof. Davidson ssid he had recently been called to examine a new system of electric clock, recently invented in this city, not yet hrought out, whose action appeared to him to bs about psrfect, and it could be attached to any two-dollar Yankee clock anywhere, snd would give perfect time.

Mr. Wenzell explained that his system was not intended for scisntific purposes. It was intended for public buildings or places whers n number of dials were needed, and which he could opsrate from one movement. In this hs had succeeded muoh better than the electric clocks, since his did not get out of order, while ths electric clocks were being continually repaired. They were moreover inaccurate. He mentioned a number of places where his system had been in use for some years, and whereve used it had given perfect satisfaction. He is about to go Esst and introduce his invention thers.

Placer County.—All of the gravel mines on the north divide around Iown Hill and Dutch Flat have commenced work. Water for washing is abundant, and a large amount of gravel will he washed this season. On the Forest Hill divide the landslides of ths late storms are delaying work. The Pemherton is running about 600 inches of water on surface gravel, which averages 15 cents to the cubio yard. The Newcastle hydraulic mins, which is located about two miles from Pino, commences piping this week. The ground, though very rich, has not been worked for mauy years. Ths quartz excitement about Auburn still continues, and new ledges are being prospectsd ovsry week. From one of them the fortunats owner exhibits a handful of specimens containing over $300.

It is not helieved that the invasion of the Ute reservation can be prevented. Schnrz fears another ontbreak. The miners are determined to enter the reservation. Ths troops ars sent out to keep matters as quiet as possible till Congress ratifies the agreement with the Indians.

Large ledges of coal have been discovered on Sun river, Montana.

Low Grade Ores at Silver Cliff.

Through the courtesy of Mr. Perkins, the accommodating Superintendent, we were enabled yesterday to visit the Silver Cliff mining and milling company's gigantic stamp mill, and to examine the workings of the institution. It is the prevailing impression that when the mill was pronounced finished, it was complete, but such is hy no means the case. At first it could not be run at a capacity of more than eighteen or twenty tons per day to advantage. Many alterations and improvements were necessary, aud in accomplishing this, and iu hringing the mill up to its proper capacity, has required much labor, expense and good judgment in management. The first month's work was more of an experiment, but during the month of March the product was in the neighborhood of thirty thousand dollars. The capacity has been gradually increased until now the average daily run is hetween fifty and sixty tons, out of which the company realize ahout $2,500 per day.

The visitor to the mill is at once impressed with the magnitude of its workings. The noisy din of the forty stamps, the roar of the crusher and amalgamating pans, and the constant grinding of the "settlers," fills one with confusion, until he hecomes accustomed to it.

When the mill was first started it was found that much of the gearing was out of proportion, and to remedy all these defects has since been the constant study and aim of Mr. Perkins. At first the stamps were only made to drop sixty-five times per minute, while now they drop ninety times per minute. This improvement was effected hy altering the "cams," or small arms which raise the stamps. The revolutions of the pans have been increased from fifty-two to eighty-six hy lagging up the pulleys and changing the hevel wheels. At first it was necessary to run the 200-horse power engine at the rate of ninety revolutions per minute, but by means of these alterations the speed has been decreased to seventy-five revolutions per minute.—*Silver Cliff Prospect.*

Kendall's Spavin Cure
Is a sure cure for spavin, splint, curb, callous, sprains, swellings, galls, lameness and all enlargements of the joints or limbs. It will completely remove a bone spavin without blistering or causing a sore. It is also as good for man as for beast, and is used full strength at all times of the year with perfect safety. A cure which we are knowing to is a person who suffered 15 years with hip-joint lameuess and was permanently cured two years ago with Kendall's Spavin Cure. Remember we claim it will cure a boue spavin and completely remove the buuch without blistering.

Office U. S. Marshal, Western Dist. of Michigan, }
Kalamazoo, April 15th, 1879. }

B. J. Kendall, Enosburgh Falls, Vt.—DEAR SIR:—I received the two bottles of your spavin cure forwarded by express in January last. I am happy to state that it performed all your advertisement called for. In three weeks after I commenced using it the spavin was entirely removed and a valuable horse estored to usefulness. Very truly yours, JOHN PARKER.

Send for illustrated circular giving positive proof. Price, $1 All Druggists have it or can get it for you.

SECURE PATENTS

Through Dewey & Co.'s **Scientific Press** Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every hranch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have heen obtained through our Agency. We can give the best and most *reliable* advice as to the patentahility of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while onr advantages for Pacific Coast inventors are far superior. Advice and Circulars free. DEWEY & CO., PATENT AGENTS.

Also, to our large and well adapted stock of

Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application.

JOHN TAYLOR & CO.

W. BRUCKNER'S

ROASTING FURNACE

AND

Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.
For circulars and prices apply to

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

The Archer Patent Invalid Bed.

By simple mechanical attachments the bed may be elevated, tilted, or adjusted to accommodate the invalid.
For full particulars see MINING AND SCIENTIFIC PRESS December 27th, 1879.
The adjustable bed bottom is put on top of the mattress, and by means of noiselessly operating cords and pulleys the patient may be put in any desired position.
The bed is adapted for persons in good health who wish an easy position, as well as it is for invalids.
This bed is of the latest improved form, with a view to simplicity, convenience and ease to the occupant.
A limited number of State and County Rights for sale.
Orders for the Patent Bed can be filled immediately.
Satisfaction will be given to those desiring to interest themselves in the manufacture or sale of this article.

JAMES H. ARCHER,

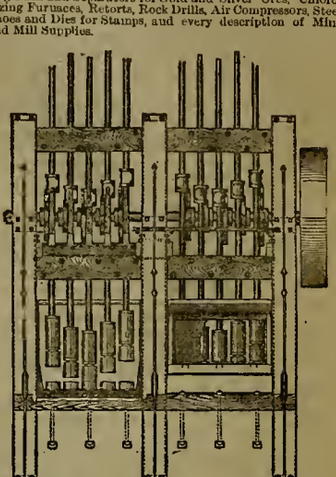
Machinery.

GOLD AND SILVER

Grinding and Amalgamating

MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlorodizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S

Wrought-Iron Frame

FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Hueme, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. O. Hoagland, S. & J. Newsom, B. Henrickson.

Diamond Drill Co.

The undersigned, owners of LESOHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

CONTINUED FROM PAGE 293.

PLACER GOLD.—*Arizona Miner*, May 1: Calvin Jackson has sent in another lot of gold dust from his Lynx creek hydraulic diggings, the result of 21 days' run, amounting to $1,800. With plenty of water the year round with which to work these diggings, they would be the most valuable property, by far, in Arizona. As it is they are a pretty good thing to have. Charles E. Bowen is in from Bradshaw and tells us that the Bisin mill will start up next week on ore from the Tiptop district, which is now being packed to the mill.

OREGON.

GRAVEL MINES.—*Bedrock Democrat*, April 28: The Placer gold mining company, of Oregon, incorporated in Ohicago, owners of extensive and valuable mines on Clark's creek, in this county, is now putting up large hydraulic pipes and "Little Giants," preparatory for summer work, and when completed will rank No. 1 for capacity and moderu improvements in gravel mining. These mines have been thoroughly prospected and when fully developed will satisfy the most skeptic investor that no other industry pays so large a profit for the risk and outlay as a good gravel mine. Powers & Co., of Rye Valley, are in full blast, running two large pipes, and with flattering results, on their hill claims. When the creek or flume ground belonging to the same company is opened, much larger returns are anticipated. We predict, at no distaut day, that gravel mining in this section will equal any on the coast.

RICH STRIKE.—One of the richest discoveries in quartz in this county was made last Friday near Pocahontas, ab ut 8 miles from this city, and about 300 yards above the well-known Baisley placer mining claims, by Messrs. H. H. Hayes, J. H. Cavanas and J. M. Luport. The ledge has been named the Tom Payne, and is under the supervision of Mr. George L. Hayes. The ledge averages from 3 inches to 3 ft in width, at a depth of 12 ft, and the rock ie the richest we have ever seen, assaying from $200 to $4,000 per ton. At present there is no mill or even an arastra on the claim, but one man with a hand mortar has pounded out as high as $238. The gold is from 871 to 879 fine. The owners of this lode intend to put up a good arastra at an early day.

CHICKEN CREEK.—I write you a few lines from this mining camp. No water in the ditch yet. Weather cold and stormy. The ditch company have some 35 men on the ditch clearing out and enlarging it, and will have water running in a short time. Miners of this camp think it will be a lively camp this summer, as they will have more water this year than they have ever had since the camp has been struck. There is more snow in the mountains here at this time than has been for ten years. The quartz mines are paying well; there have been some new discoveries made, and the richest rock that has been found in this part of the country. The owners of these new mines are at work taking out rock, and ere long you will here of some huge clean-ups being made. There are about 60 white men in this camp, and about 30 Chinamen. The mines on Burnt river prospect well. Messrs. Farnsworth and Sisley have their 4 miles of ditch completed, and will be ready for work in a few days. Mr. Charles Green is still prospecting his mine and getting good returns. Brooks & Woods have been running their 5-stamp mill on rock out of their mine on Gold Hill, which pays well.

News in Brief.

COPPER ledges have been found at Mohave, Arizona.

PARTIES of Eastern railroad men are visiting New Mexico.

AN intense anti-Chinese feeling prevails at Ottawa, Ontario.

THE decrease of the public debt during April was $12,078,070.

EXTENSIVE coal discoveries are reported from Hay creek, Dakota.

A MINING speculator has made $40,000 in Boulder county this year.

W. H. DOOLITTLE, Associate Commissioner of Patents, has resigned.

SOUTHERN California papers are agitating the project of forming a new State.

FOURTEEN emigrant teams left Chico for Washington Territory last Thursday.

AMERICAN hogs may now be entered in Canada, and slaughtered upon their arrival.

THOMAS A. SCOTT has resigned the Presidency of the Pennsylvania Railroad Company.

IT is thought probable at Washington that Congress will adjourn on the 1st of June.

THE track of the Southern Pacific railroad is now laid thirty-four miles east of Tucson.

THE farmers and gardeners of Salt Lake City are a month behind with their spring work.

A STEAMER is now making regular trips on Frazer river, in British Columbia, as far as Yale.

IT is computed that there is gold ore enough in Bingham, Utah, to run 1,000 stamps 100 years.

FOR a week past Prescott has been persecuted with a Southern Arizona wind—acrid, arsenic and alkalic.

PREPARATIONS are being made to celebrate the Queen's birthday at New Westminster and at Victoria.

THE Parrot City Gold company has sent to New York for a four-mule load of arms and ammunition. The Utes must go.

A CALCUTTA dispatch says that the Maharajah of Cashmere is suspected of carrying on a secret correspondence with Russia.

A LARGE portion of Sierra valley is covered with water under the snow, which makes traveling extremely disagreeable.

IN Rico flour is $30 per hundred, coffee 65 cents, and sugar 65 cents per pound. Whisky that will kill one mile, 25 cents per drink.

A BRANCH road will be constructed to Silvertou from the junction of the Denver and Rio Grande railway at Animas City. Ditto to Rico.

The *Idahoan* says: Large numbers of men are camped on the overland road, waiting for the roads to improve, so they can go to Wood river, Idaho.

ANDY MILLSAP, of Grindstone, Colusa county, has killed three panthers and one bear this winter, but the panthers killed about sixty sheep for him.

MAYOR KALLOCH has been impeached by the San Francisco Board of Supervisors, and legal proceedings are to be instituted for his removal from office.

THE population of Spokane Falls, Washington Territory, is about 400, and is rapidly increasing. Lots are worth from $270 to $800, according to location.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING APRIL 27TH, 1880.

226,824.—CAR COUPLING—E. T. Barlow, S. F.

226,901.—MACHINE FOR MAKING METALLIC LATHS—C. H. Carter, S. F.

226 909.—WASHING MACHINE—J. Frellocher and F. Mahler, S. F.

227,022.—PUSSA FASTENER—N. C. Larsen, Sacramento, Cal.

226,918.—AIR COMPRESSOR—L. B. Lawrence and W. P. Hammond, Oakland, Cal., and A. G. Strawbridge, Sbaron, Pa.

9,173.—EXPLOSIVE COMPOUND.—A. Monnier, S. F., (reissue)

227,038.—AUTOMATIC COIN-COUNTING DEVICE—W. C. Morrison, S. F.

227,049.—DOUBLE-TREE—J. J. H. Parrot, Salem, Ogn.

226,933.—PREPARATION FOR COATING INGOT-MOLDS—A. L. Limodi, Silver City, Idaho.

227,065.—WATER WHEEL—W. Sims, Stayton, Ogn.

226,392.—FORMING LINK—S. Ureu, Sacramento, Cal.

226,881.—CAR BRAKE—C. W. Richardsou, E. and J. E. Dawson, Red Bluff, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Resources of Arizona.

In another column we give the second of a series of articles on Arizona, which have been compiled for the PRESS in order to give our readers as full and reliable information concerning that growing Territory as is at present attainable. As we have had to use the testimony of other writers, we can only say we have sought to give our readers the best at command. We intend soon to send a special correspondent to this new and important field, and to furnish every detail concerning the different mining districts and the material resources of the Territory which it is possible to procure. Our correspondent will visit the principal mining fields in Arizona and collect such statistics and details as are available. What we now give is somewhat general in its character. So great an interest is manifested in all that relates to the Territory, and especially its mining resources, that we shall spare no trouble to gather and publish such information concerning it as will be of value to our readers.

Various Causes—

Advancing years, care, sickness, disappointment, and hereditary predisposition—all operate to turn the hair gray, and either of them inclines it to shed prematurely. AYER'S HAIR VIGOR will restore faded or gray, light or red hair to a rich brown or deep black, as may be desired. It softens and cleanses the scalp, giving it a healthy action. It removes and cures dandruff and humors. By its use failing hair is checked, and a new growth will be produced in all cases where the follicles are not destroyed or the glands decayed. Its effects are beautifully shown on brashy, weak, or sickly hair, on which a few applications will produce the gloss and freshness of youth. Harmless and sure in its operation, it is incomparable as a dressing, and is especially valued for the soft luster and richness of tone it imparts. It contains neither oil nor dye, and will not soil or color white cambric; yet it lasts long on the hair, and keeps it fresh and vigorous.

FOR SALE BY ALL DEALERS.

Organs and Pianos.

The Hon. Daniel F. Beatty, of Washington, New Jersey, comes to the front with what we consider the greatest offer ever made on first-class Pianos and Organs. The celebrated instruments of his manufacture have attained a world-wide celebrity for purity of tone, excellency of workmanship and every quality that can make instruments *desirable and durable*. A fairer or more liberal offer was never made, for, if in any particular the description of instrument differs from the advertisement, Mayor Beatty will take it back and pay all freight charges both ways. As an evidence of his immense popularity among those who know him best, we mention the fact of his re-election lately as Mayor of his city by an overwhelming majority. Any one contemplating the purchase of an Organ or Piano should send for his latest illustrated circular, which is complete in every detail. Read his advertisement.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

Chew JACKSON'S BEST Sweet Navy Tobacco.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Atlanta Mining Company.—Location of principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, April 29th, 1880, and day of sale to Monday, May 24th, 1880. By order of the Board of Directors. A. F. McGREW, Secy.

Office—Room 7, No. 420 Montgomery Street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, May 21st, 1880, and day of sale to Wednesday, June 23d, 1880. By order of the Board of Directors A. F. McGREW, Sec'y.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

Palmer Ice and Refrigerating Company.—Location of principal place of business, San Francisco, California. Location of works, 224 Fremont street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of April, 1880, an assessment (No. 2) of $5 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, No. 303 Montgomery street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 24th day of May, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 17th day of June, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. C. O. PALMER, Secretary.

Office—No. 303 Montgomery St., San Francisco, Cal.

ANNUAL MEETING.

OFFICE OF THE

Pioneer Consolidated Mining Company,

A meeting of the stockholders of the Pioneer Consolidated Mining Company for the election of a Board of Trustees to serve for the ensuing year and for the transaction of such other business as may come before the meeting, will be held on MONDAY, the Twenty-Fourth day of May, 1880, at 2 o'clock P. M., of that day, at the office of the Company, Room 4, 309 California street, San Francisco California. Transfer books will be closed on Friday, the Twenty-First day of May, 1880, at 3 o'clock P. M. J. M. BUFFINGTON, Secretary.

Office—Room 4, 309 California street, San Francisco California.

ANNUAL MEETING.

The Annual Meeting of the stockholders of the Original Gold Hill Gold & Silver Mining Company, for the election of a Board of Trustees to serve for the ensuing year and, also, for the transaction of such other business as may properly come before it, will be held on Monday, the Tenth (10th) day of May, 1880, at the hour of 2 P. M., at the office of the Company, Room 4, 309 California street, San Francisco, California. Transfer books closed on Friday, the Thirtiotb (30th) day of April, 1880.

J. M. BUFFINGTON, Secretary.

Office, Room 4, 309 California, St., San Francisoc, Cal.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company,

San Francisco, May 1st, 1880.

At a meeting of the Board of Directors of the above named Company held this day,

Dividend No. 15 of Seventy-five Cents (75c)

Per share was declared, payable on Wednesday, May 12th, 1880, at the office in this city or at the Agency of the Nevada Bank of San Francisco in New York.

WM. WILLIS, Secretary.

Office—Room No. 29, Nevada Block, No. 309 Montgomery Street, San Francisco, Cal.

Improved Grounds For Sale

NEAR SAN JOSE.

The subscriber offers for sale a tract of land, 40 acres in extent, located half a mile south of the road from San Jose to Alum Rock, and four miles from San Jose—directly in the warm belt of the foothills. The grounds are pleasantly and conveniently located, and under a high state of cultivation.

Five Acres in Orchard,

— CONSISTING OF —

Orange, Lemon and Lime Trees, Nuts, FIGS, ETC.,

Together with a great variety of other Fruits, large and small, and GRAPES. TWO ACRES are set off for an

ORNAMENTAL GARDEN,

Which is now filled with Shrubs, Flowers and a fine growth of ORNAMENTAL TREES, 170 in number, now 11 years old. In connection with these grounds there is now a

Small Cottage and Farm House,

Well built and hard finished. On the higher ground there is a

FISH POND,

40 by 80 feet in extent, and 8 feet deep, well stocked with Carp. The pond is supplied with water from a never-failing spring a few feet distant, which delivers 24,000 gallons of water every 24 hours the year round. The pond is at an elevation of 20 feet above the house, and from it pipes are laid for irrigating the orchard and garden, and supplying the house.

Forty-three acres additional will be sold if desired, making a total of 83 acres.

This place affords a rare opportunity for anyone desirous of securing a well improved locality for an elegant country residence, and will be sold at a great bargain. For further information apply either at this office or of the proprietor on the premises.

C. FIELDSTED.

SUPERIOR TO THE CORLISS!

Our New Automatic Engine.

First—The Corliss Engine cannot, as a rule, take steam beyond two-fifths the stroke—unless it takes it all the way.

We can take five-eighths or three-quarters, or even more, if needed, and at the same time work down to one-tenth or one-twelfth, and get a good engine port

Second—The Corliss cannot, without sacrificing some of this two-fifths and reducing its range of governing to a minimum, give any exhaust lead or cushion. The consequence of this is that Corliss Engines of almost every builder thump badly, and also need to be much larger than is absolutely required, so as to be ready for emergencies. It is plain that an engine that can give only two-fifths of a stroke cut-off is not to be relied on for sharp work under heavy change of load and must have a heavy fly-wheel to steady it.

We can give just what we need. Our New Automatic has trunk frame like the Corliss, but has rotary valves, both at bottom of the cylinder like the Wheelock. This is to save clearance. The valves are operated by cam motion, thus giving the most perfect opening and closing known. The valve opens full width and no further, and shuts just enough for safety. This saves wear and tear of reciprocating parts. Two eccentrics operate valve gear—one fixed, giving an invariable point of opening the steam and exhaust and closing the exhaust. The movable eccentric controlled by a rotary governor fixed on main shaft, where it can never get away, controls the closing, the valve being alternately controlled by the two eccentrics. No dash-pots nor noise, and the most exquisite adjustment.

We have two of these Engines already on the way, for parties on this coast.

TATUM & BOWEN,

329 Market Street, San Francisco.

L. P. DECEN.

MANUFACTURER OF

NO. 10 FREMONT ST., near Market, SAN FRANCISCO

N. W. SPAULDING'S

PATENT DETACHABLE TOOTH SAWS,

Manufactory, 17 & 19 Fremont St., S. F.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and hand Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swazing, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid

ROBERT GRIMSHAW,

624, 626 and 628 Market Street, Philadelphia.

March 10 1880.

RICHARD C. REMMEY,

PHILADELPHIA CHEMICAL STONE WARE

Manufactory,

1110 E. CUMBERLAND ST., PHILA.

Manufacturer of all kinds of Chemical Stone Ware for Manufacturing Chemists and others, such as Receivers, Acid Coolers, Mixing Pots, Stone Boxes, Worms, Elbow Pipes, Connecting Pipes, Sleeves, Pans, Dishes, Tin Crystal Jars with Lids, Still Heads, Ointment Pots, Jugs and Pitchers.

Notice! Important to Miners!

An important Machine called the

DRY GOLD SEPARATOR

Has been invented and can be seen at No. 5 Beale St., S. F. Arrangements have been made to manufacture in quantities to suit the demand. Machines weigh from 200 to 300 lbs. Price, $30 to $150. They run 10 to 20 tons of gold-bearing earth through per day, thoroughly separating the precious metals from the earth. Several are at work in Arizona and Mexico. A guarantee with each machine. Call and see sample at No. 5 Beale street, near Market, San Francisco

HOW TO STOP THIS PAPER.—It is not a difficult task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

THE NEVADA OVAL TOP RETORT.

The advantage of this Retort over the OLD FLAT PATTERN is, that it can be filled full of Amalgam, thereby holding more than the old style, besides avoiding all danger of an explosion owing to the crown space in the cover which allows for the expansion. They are made extra heavy, WELL GROUND in the joints, and are furnished with a strong Norway clamp, having a wrought iron key which can be driven in or out of place by a single stroke of a hammer.

The Annoying Thumb Screw is Entirely done away with.

We Make Seven Sizes, as follows:

Number or Pints.....	1	2	3	4	5	6	10
Holds Pounds Quicksilver	12½	25	38	50	63	75	125
Weight each.....	10 lbs	15	18	25	31	44	65

Mortars and Pestles,

GROUND INSIDE.

Size—Quarts....	½	1	2	4	6	8	12	16
Hight—Inches..	37	5	6	7½	8½	9	11	12
Weight—Pounds	6½	9	16	22	37	43	72	86

Bullion Ladle.

Forged from one piece of Charcoal Iron, [eight inches in diameter by four inches deep.

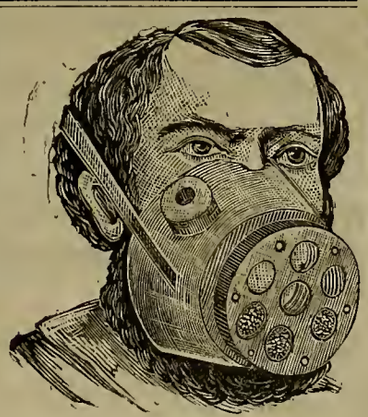
Send for Circulars and Prices.

DUNHAM, CARRIGAN & CO., Agents, San Francisco.

PATENT

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.



INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price.

Beatty's Latest Offer.

Beatty's best Parlor Organ, for the Home of the Millionaire.

BEATTY ORGAN, *Style No. 3000.* This beautiful organ like cut opposite, contains fourteen (14) Stops, three sets of Golden Tongue Reeds, Beatty's Patent Stop Action, found in no other makes, five octaves, Height, 59 in.; Depth, 24; Width, 49; Weight when boxed about 500 lbs. "Beatty's Best" is conceded by good judges of musical instruments, to be the most perfect organ manufactured. It not only contains all the latest improvements but for style, finish and durability, it has no equal. The action or musical parts is fitted up with **Golden Tongue Reeds,** which have, by years of trial, proved to be the most durable as well as the most musical. It also contains "Beatty's Patent Stop Action," the latest and most improved stop action in the world. It is attached to no other instrument except Beatty's, and is the greatest improvement yet made to an organ. The case is of solid black walnut, firmly constructed, ornamented with French veneered panels, and finished up in **Grand Style.** It has a sliding lid, ornamented **lamp stands,** and conveniently arranged handles for moving. Its bellows, which are of the upright pattern are of great power, and are fitted up with **steel springs** and the best quality of pedal straps. The **pedals, instead of** being covered with carpet, are made of metal and are of neat design, and never get out of repair or foot worn, like carpet. Other Manufacturers' price, about $160.00

☞My price in any new locality, in order to have this Style introduced, boxed and shipped with Stool & Book, ONLY $125.00

RE-ELECTED MAYOR. On expiration of my first term as Mayor of Washington, the high honor of a re-election to the position of its **Chief Magistrate** of my thriving city by an increased majority, was again conferred upon me. To my many friends who have suggested my name for **Congressional Honors,** I will say, that my **immense business interests** will compel me to decline. The name of "Beatty" is known wherever civilization exists, as the man who first brought the prices of Pianos and Organs within the reach of the masses. He it is who has received more abuse from rival manufacturers and Agents than any other man on the face of the earth. Having shrunk from no labor, relaxed no energy, spared no expense, I am still determined that my fellow countrymen shall not pay the Monopolists' prices. My record in behalf of my fellow men at home, the poor, the church, the Sabbath school, let others speak. Not alone in my own land, have I enjoyed distinguished honors, but also in the Palaces of Kings and Emperors in the old world. (See "Beatty's Tour in Europe.") Only a few years ago I left my father's plow, without a dollar. To-day I own one of the largest Piano and Organ factories in the World. Cor. Railroad Avenue and Beatty Street, Washington, New Jersey. Why? Because I sell first class goods at low prices. Quick sales and small profits, honest and fair dealing to all men, is the secret of my **great success.** Beware of Agents, I have no agencies in large Cities but sell directly from the factory.

BEATTY PIANO *Style, No. 2020,* 7 Octaves, Agraffe Treble, fine rosewood, all latest improvements. The price of this piano boxed, and shipped with Stool, Cover and Book, only **$210.** "The Pride of the Parlor" a magnificent 3 string instrument only **$237.50.** Beatty's best Chapel Organs, only **$120.**

Always remit by Post Office Money Order Draft, on New York or Express. Money refunded if unsatisfied, and freight charges paid by me both ways. **Labor and material are advancing.** Now is your time to order. Be sure to read my Latest Illustrated Newspaper & Catalogue before you purchase elsewhere **Sent Free.**

If you do not want an instrument for your own home, advise your Friend to buy one. Every instrument when introduced, sells another. **It becomes a standing Advertisement.** Please show this Advertisement to your neighbors who are talking of buying an instrument

Address all orders to **DANIEL F. BEATTY, Washington, New Jersey.**

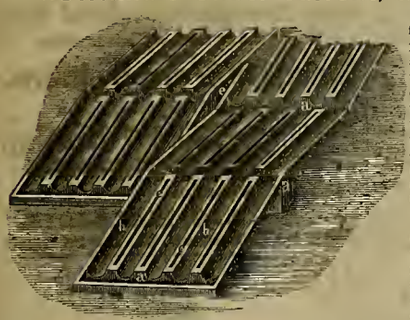
REVOLVING CYLINDERS AND ORE DRYERS.
Hoisting and Pumping Machinery.

Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

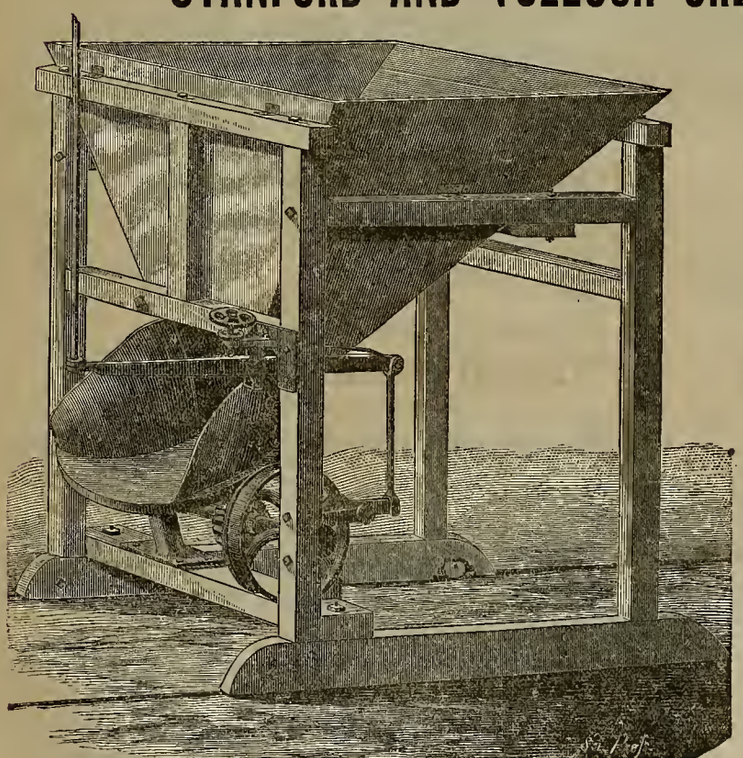
Small Sizes made in Sections not to Exceed 300 lbs.

The $1,000 Challenge Ore Feeder

AT REDUCED RATES.

—ALSO THE—

STANFORD AND TULLOCH ORE FEEDERS.



"THE $1,000 CHALLENGE ORE FEEDER."

Several Hundred of the Famous

CHALLENGE ORE FEEDERS,

Are in use in many mills on this coast, and wherever used give great satisfaction.

The STANFORD Feeder, made by me, has superseded the Victor Ore Feeders, furnished by E. T. Steen, in the Alexander mill, J. B. Cooper, President, office, Safe Deposit Building, S. F. By special permission I am enabled to refer interested parties to Mr Cooper.

In this connection I will state that I will give $50 to be shown up to this date one of the Eclipse Ore Feeders, manufactured by Prescott, Scott & Co., of the Union Iron Works, which is in general successful practical operation at any quartz mill on this coast.

I have made a specialty of manufacturing ORE FEEDERS, and know which will give satisfaction for steady work. The Improved

STANFORD FEEDER

Will beat any one in use—always excepting the CHALLENGE, which is THE BEST OF ALL.

By use of CHALLENGE ORE FEEDER there is 15 per cent. less wear and tear of iron than by hand feeding. There is also 20 per cent. more ore crushed.

I make at my works

The Challenge

AND THE

HENDY ROCK BREAKERS.

The CHALLENGE is the best rock breaker at work today. The HENDY is the newest thing in this line, and is worthy of close examination by all mill men. Call and see it.

SAN FRANCISCO, SATURDAY, MAY 15, 1880.

VOLUME XL. Number 20.

Mines of Amador County.

We have been shown a recent report, by Mr. Wm. Rose, on the Providence Con. mine, situated near Volcano, Amador county, which contains some interesting facts concerning also other mines and the general characteristics of the district. The Providence Con. embraces the old Rose and Providence claims; the former being a relocation of the Siebenthaler mine, covering 20.10 acres, which was worked in 1860-62. The latter location was made subsequently by Mr. Rose. The ground is situated near the upper end of Dry creek, among the foothills of the Sierra Nevada, at an approximate altitude of 2,700 feet above the sea level. The distance to the railroad station at Ione City is 23½ miles, and to Latrobe 22 miles. The towns of Volcano and Oleta are in the immediate vicinity of the district, and the travel from San Francisco is stated at 14 hours.

Amador county lies between the Cosumnes river on the north and the Mokelumne on the south. These streams rise within a short distance of each other, and, where they cross the Downs lode, in the lower portion of the county, are about 14 miles apart. In this section extensive quartz operations have been undertaken; especially since 1878. The climate is mild and equable, admitting of mining and milling being prosecuted throughout the year. Placer mining has also been carried on in the neighborhood, yielding, it is said, $7,000,000 between the years 1849 and 1860.

Among the quartz mines, Mr. Rose cites the case of the Downs mine, which had been abandoned from 1861 till 1878, when it was relocated; it is said that the expenditure of $6,000 led to a net monthly output of $16,000. Another abandoned mine, the Golden Gate, owned in New York, has also been made a paying property. These examples, Mr. Rose thinks, will lead others to recommence work, and that the district will be as important, as a quartz mining country, as it has been as a placer region.

The Downs lode is a quartz belt running in a north and south course through the center of Amador county. On this belt a large number of locations have been made, among them the mines mentioned in the report. The croppings of the lode are in line with those of the great quartz veins of Mariposa, Tuolumne and Calaveras counties on the south and El Dorado county on the north. The lode is not a continuous bed of quartz, but rather a series of nearly parallel detached veins and irregular masses, with barren intervals between them. There are occasional deflections, but the general course is as stated above. The lode near the surface has a general dip to the east of 45° to 72°, gradually becoming more vertical as depth is attained. In thickness it varies from five to fifty feet, sometimes expanding still wider, but in such cases filled with fragmentary slate and broken quartz.

The principal formation in Amador county is the slate, with occasionally limestone and soapstone. The quartz ledges in slate have marked walls and carry a well-defined gouge of clay which facilitates the extraction of ore. In the case of the Downs lode the western or foot-wall is a black slate, and the eastern or hanging wall a metamorphic rock—greenstone. It is claimed by Mr. Rose that with the present facilities for crushing, low-grade ores can be profitably handled. According to official report there are now 680 stamps in operation in the county.

FOREST fires are still raging in Pennsylvania.

Cable Grips.

The suit of the Traction Railroad Company vs. the Sutter Street Railroad Company has been on trial for the past two weeks in the United State Circuit Court. This suit has excited considerable attention, especially from those interested in street railroads, as it involved the use of a dummy in combination with a grip working in an underground tube, a traveling rope and a car, being Patent No. 112,663, granted to A. S. Hallidie, September 26, 1876, and assigned by him to the Traction Railroad Company. This device is in use by all the cable roads in this city.

During the course of the trial the history of the invention of the cable roads was clearly set forth, and Mr. A. S. Hallidie's priority of invention proven. It was shown that he had originally conceived the idea, and made the first experiments on the application of iron rope to the transportation of passengers over the steep hills. After some difficulty in raising subscriptions, a company was formed, and in Sept., 1873 the Clay Street Hill road began operations.

In the meanwhile numerous patents had been granted to Mr. Hallidie for his various inventions, and on March 24, 1876, he applied for the patent involved in the suit, viz, the dummy. It was claimed by the defendants (Sutter Street Railroad Co.) that the right to the patent was forfeited, more than the two years allowed by law having elapsed since the "dummy" had been in public use. The evidence showed, and the Court ruled that it was only in experimental use, and that the two years limitation could not run against a machine not perfected sufficiently to work successfully. The defense also claimed that the elements of the combination were old. The Court ruled, and it was not denied that the combination produced a new and useful result, and the jury was instructed that such a combination was patentable.

It was shown in the evidence that the Sutter Street Railroad Company visited the Clay Street Railroad works repeatedly for the purpose of learning how things worked, and that they afterwards used the devices operated by the Clay Street railroad; that in June, 1876, the Sutter Street Company obtained a franchise to use wire rope on Sutter street, and that in January, 1877, they first put their cable road in operation, and have continued since to operate a road worked in part by horses and in part by wire rope. On the question of damages there was considerable dispute, and the jury assessed them at $1, finding for the plaintiff on all points relating to the patent, and sustaining its validity. It appears from the decision that Mr. Hallidie is entitled to the honor and profits of the invention, which, by the way, was patented through the MINING AND SCIENTIFIC PRESS Patent Agency.

The Mining Law.

In our last issue we presented the substitute for the Public Land Commission's Mining bill, which had been prepared by the Congressmen from the Pacific coast, and is to be introduced in the House as soon as practicable. Section 2322 of chapter six of the Revised Statutes is to be amended by adding: "And in all cases where the mean dip of the lode does not exceed 25 degrees from the horizon the right to follow the mineral shall not extend beyond the side lines of the location drawn downward vertically, on any mineral land where there is no outcrop of a vein or lode on the surface of the ground."

The House Mining Committee this week adopted the bill as agreed upon by the Pacific coast delegation. Representative Belford was authorized to report it for passage, by a practically unanimous vote of the committee, Warner, of Ohio, being the only member present who refused his concurrence. He took the ground that the passage of this bill will have the effect of preventing action on any other branch of the Public Land Commission's Mining bill, and he is doubtless correct in this view, it being, in fact, the intention of the framers of the measure to regard it as a substitute for the whole of the recommendations made by that commission in regard to mineral lands and mining laws.

Meetings of miners still continue to be held to protest against the original amendments offered, and it is not likely they will ever pass. Those referred to above are intended to take the place of the whole bill as offered by the Public Land Commission.

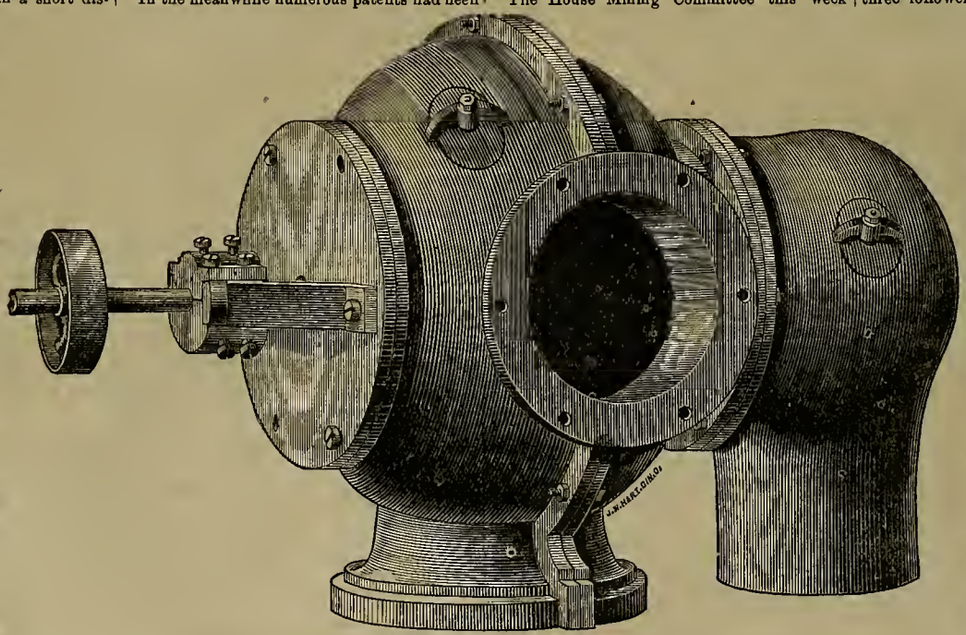
THE Comstocks are lower, in the aggregate, at the present time than they were during the great depression of 1877. On Tuesday last their value was about $13,000,000, while in 1877 the bonanza mines alone were selling at the rate of $15,000,000.

U. S. TROOPS have been sent to Indian Territory to drive out settlers.

Myers' Horizontal Flume.

This new and useful method of using turbine water wheels we illustrate to-day. Many of the quartz mills and saw mills on this coast have this case in use, and it has given universal satisfaction. It consists of two semi-spheres flattened at their sides, so as to give the largest space for water to pass opposite to the buckets of the turbine, or where the water is admitted to the wheel.

It is made usually of cast iron, and strong enough to stand the pressure of 100 feet or more. The shaft of the wheel passes through a stuffing box, and a journal as well as the stuffing box receives the lateral pressure or draft of the belt. This stuffing box is lubricated with water from within. The bottom of the shaft is sustained by a step and journal within the draft tube. The step resists the downward pressure of the water while the journal carries the weight of the wheel, and is so arranged with three followers of wood that where they wear they can be set up with set screws; this journal is lubricated with water. There is so little weight and wear on this journal that it lasts for years without repairs.



MYERS' HORIZONTAL FLUME.

This device was patented by A. Myers, in 1873, and was first used in the Eureka mill, on the Carson river, Nevada, with a 52-inch Leffel wheel under a head of 38 feet, developing 444 horse-power.

It was next used at the Empire mill, at Plymouth, Amador county, Cal., under 78 feet head, where a 20-inch Leffel wheel drives an 80-stamp quartz mill and other machinery. Then, shortly after, it was used at Truckee, Nev., under 125 feet head at the Lonkee & Smith saw mill, where a 15-inch wheel develops 150 horse-power, and they have sawed 123,380 feet of lumber in 24 hours consecutive running. Since then it has been used in scores of other mills, and in every instance it is a success, and in all the mills is working to-day as satisfactorily as at first.

The patent was issued to A. Myers in 1873, and he is the only manufacturer at present. They are made in this city at the Ætna Iron Works. Any further information will be cheerfully answered by the inventor, who, also, is the only manufacturer of the celebrated Leffel turbine on the Pacific coast.

RIVER AND HARBOR APPROPRIATION BILL.—The following items are in the river and harbor appropriation bill reported to the House of Representatives: Constructing a canal around the Cascades of the Columbia river, $100,000; Upper Columbia and Snake rivers, $15,000; Upper Willemette river, $2,000; Lower Willemette and Columbia rivers, from Portland, Oregon, to the sea, $45,000; Oakland harbor, California, $60,000; Sacramento river, $30,000; San Joaquin river, $15,000; Skagit river, Washington Territory, $2,500; Petaluma creek, California, $8,000; Cowlitz river, Washington Territory, $2,000; Chehalis river, Washington Territory, $5,000; Yequina bay, Oregon, $40,000; Coquille river, Oregon, $10,000.

SERIOUS trouble is anticipated in the coal mining districts of St. Clair county, Mo. A combination has been formed by the Miners' Union to close all the mines simultaneously until the differences may be settled.

LANGLEY'S Directory for 1880 which has just been issued, contains 109,540 names, being a small increase over the number contained in the Directory for 1879.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Late Rain Storms.—Modes of Measuring.

Editors Press:—The unprecedented storms of the first three weeks in April, through the northern and central portions of California, have brought to this portion of San Joaquin valley its share of the heavy rains. The entire rainfall at Hanford for April, which ended at 5 P. M. of the 22d, was 3.53 inches, making for the season 12.34. Ths season's rainfall at Visalia varies hut little from this. We have not learned here the amount which fell the 22d; but on the 21st the relative amount shown by the gauges at sach point was: Visalia, 12.05 inchss; Hanford, 12.14. It may be of interest for your numerous readers to compare rains, including the 21st of April, at the following points: Merced, 10.99; Modesto, 12.10; Stockton, 14.12; Sacramento, 25.25; Woodland, 15.93; Marysville, 17.45; Colusa, 17.90; Hollister, 12.34; Salinas, 12.50; Pleasanton, 19.50; Oakland, 22.35; San Francisco, 25.31; and for our higher regions: Healdsburg, 54.74; Auburn, 36.47; Nevada City, 57.52; Shasta, 63; Georgetown, El Dorado county, 63 inches. Bearing these figures in mind, together with the fact that the rains for various points named,

For the First Three Weeks of April

Alone, has ranged from 2.50 to 18 inches, and we can realize what a peculiarly wet season this has been for California. To our friends East it will prove that it *does* rain here sometimes.

It is worthy of record in the Rural that the gauge used for measuring rains at Hanford is one of those ordered made by the State Engineer's Department, to learn the rainfall at various statione established by the State Irrigation Survey. Major A. G. Warfield, Assistant Engineer, left it here as a ceutral point for the Mussel Slough district, in February, '79. It is well placed—ahout six feet above the ground, free from buildings and other screens. Its measurements have been carefully and regularly observed and recorded.

Near Borden, Fresno county, the rain to April 16th was 9.14 inches, as measured by a hrass cylinder gauge manufactured by James Green, of New York. The amount there since we have not learned.

Coneiderable Surpriee

Has been expressed locally by those aware of the fact that a railroad rain gauge at the Lemoore depot, nine milee west of here, ehould show considerably less rain each month and for the season than the State Engineer's gauge at Hanford. To illustrate: The rain record this season at Hanford, for differcnt months, is: 1879, October, 0.93; November, 0.94; Decemher, 2.43; 1880, January, 1.09; February 3.45; March, 0.47; total through April 16th, 11.47 inches. Here the snow of January 28th was measured as rain, heing allowed to melt in the gauge, as was best. At Lemoore, the same snow is recorded as snow 1¼ inches deep. Now, the usual rule is, that 10 inches of snow, as it first falls, equals 1 inch of rain. Consequently, to reduce this 1.25 inch of snow to the rain standard, it shonld be called 0.12½ or say 0.13 of an inch. For January at Lemoore, this shonld be added to the rainfall recorded there, 0.43, and it makee the rain for January there 0.56. With this necessary explanation and correction, we give now the corresponding rain record at Lemoore: 1879, October, 0.42; November, 0.56; December, 1.40; 1880, January, 0.56; February, 2.67; March, 0.46; total through April 16th to 5 P. M., 8.10 inches. Now, Lemoore ie nine miles

Nearer the Coast Range

Than Hanford, and it is well known that as you go nearer the Coast range in this valley, the rainfall diminishes. But this variation of 3.37 inches is too great to be accounted for by local differences only. So yonr correspondent, who has studied and enjoyed the handling of different kinds of rain gauges for 25 years, eet to work to learn, if poesible, the cause of this difference. For, it is very importaut, not only for the rain record here and in other parte of the Pacific coast, that any error of measurement, if such existed, should he made known, but for the general intereets of scientific accuraoy in euch questions of meteorology, and to secure for such measnrements a proper confidence. What follows is not for fault finding, but to seek the truth. It gives me pleasure to inform your readers, that

The Cause of Such Difference

Has been detected with certainty in the mode of measuring, and that the railroad agent at Lemoore, Mr. James Dickson, a very clever young gentleman—who, I doubt not, had measured and recorded the rain there carefully, according to hie instructions—kindly gave me every facility for learning the amounts recorded there and tho mode of measurement. Results are as follows: The gauge used is the brass cylinder; inner diameter of upper part about two and one-half inches, lower part about one-half inch. For measurement, the instrument maker has prepared a metal rod, graduated into tenths aud hundredths of an inch. This is to be thrust down to bottom of the small tube of the gauge, and according to the hight to which the rain water risee and wets the rod, you read of so many hundredths, etc., as the amount of rain. Of course the maker has had to calculats accuratsly just

How Much Water is Dieplaced

By this rod, when it is placed in the tube, so that it may accurately show the rainfall.

Now, it so happens that water does not adhere well to a metal rod. But this trouble is easily overcoms, hy breathing upon ths rod or placing on it the dust of flour or dry sand just before inssrting it into the cylinder. To ohviate this difficulty, a small wooden rod—walnnt—has besn sent the agent from the company's office at Sacramento. This he dips into the tube, the watsr readily marks upon it the point to which it risss. Wet in this way, it is laid side hy side with the graduated part of the metal rod, and from the latter the parts of an inch are read off.

Here Comee in the Error.

The wooden rod is just about half the volume of ths metal. Hence it does not displace as much water, the latter does not rise as high around it, so that it does not show as much rain as if the metal rod were placed in the tnbs.

The important question is, what fraction will express approximately the degres of error thus produced? This is easily ascertained, as was done at once, when Mr. Dixon explained the method used for measurement. A small rain remained in the tubs unmeasured. To prove the error, the metal rod, coated with the vapor of the hreath, was placed in the tuhe. When removed it read 0.06 of an inch. Next the walnut rod was inserted. When removed and placed by the graduated metal rod it showed only 0.04½. Here was the customary mode of reading it. But this was 0.01½ less than to read by the correct method. Now, 1½ is what part of 4½? Exactly one-third. Add that third to 4½ and it gives the correct measurement—0.06.

Consequently, all measurements by the woodcn rod half the size of the metal rod should be

Increaeed by One-third

To give correct results. Of course, a wooden rod just the eize of the metal one would make correct measurements, provided that ite porous character did not allow it to absorb some of the water by capillary attraction.

It follows that 8.10 inches should be increased by one-third to show approximately the proper rainfall at Lemoore to April 16th inclusive. This adds 2.70 inches, making in all 10.80 inches, or only 0.67 of an inch less than fell at Hanford during the same part of the season. Here is

Quite a Satiefactory Reeult.

Let us apply the correction in one other instauce. The heavy rain of 48 hours, ending February 21st, at Hanford was 3.25 inches; at Lemoore, we were surprised to find only 2.25. But add to the latter one-third, or 0.75, and we get 3 inches—ahout the correct amount, no doubt, for Lemoore. In conclusion, it is important to observe, that if the mode of measuring at every railroad etation hae been uniform a corresponding error exists in all their rain records. J. W. A. W.

Globe District.

A correspondent of the Phœnix (Arizona) *Herald* says:

I am etill stopping in this district, and the longer I stay the more I find to interest me, as the mineral is not confined to one or two narrow veins or ledges, but extende for eeveral miles in width, so that something new ie discovered every few days. I find that there ie here eomething that not only surprises but intereste all who take the trouble to investigate some of the property located here.

I have found the greatest variety of ore here, hoth in quantity, quality and character, of any belt I ever visited, so that at the present time I am prepared to believe almost anything I hear in the way of new discoveries. There seems to be a big error in regard to this district regarding our mines and ore hodies, as most who come here have the impression that there ie only emall pockets on the surface, eo at the arrival the inquiry comes, "How deep are you, and how does it look at that depth?" We recommend a personal visit, and then, Yankee-like, ask them how it looks ou the bottom. "Better than on top" is the verdict usually, so that we are satisfied that we have everything that is required to make a good district.

At the Basin, several new prospects have been opened up and are showing good, ae is also the Southwest Alice. This mine was opened hy a shaft 100 feet deep, and pronounced by all to be a fine property. Still recent improvements by drifting is placing it on the list that contains the best.

The South Silver Nugget is improving rapidly and is destined to be among the first in the ranke as a producer of bullion.

The etrike in the Borel continues to hold out, and it wouldn't be surprising if that, in a ehort time, it would justify the building a mill; in fact, it ie difficult to find any improvement going on but what is showing satisfactory returns, so that at the present time everyone is elated and happy, ehowing that the "hoom" has finally etruck Globe.

The Highest Mine.—The higheet mino in the United States, and probahly in the world, is the Present Help, on Mount Lincoln, in the main range of the Rocky Mountains, Park county, Colorado. Mount Lincoln has an altitude of 14,297 feet. The present Help boarding house, huilt alongeide of the main drift, is ahout two hundred yards away from the eummit of the mountain, and 140 feet lower down. This leaves it 14,157 feet above the sea level.

Quartz Mining in Tuolumne Co.

The following itsms of iuterest are condensed from the *Tuolumne Independent*. Soulsbyville is strictly a quartz mining camp, yet only two or three of the numher of mines noticed here may he said to bs fully dsveloped, and hut one of the numhsr to any extent. The claims hereiu noticed are located in differsnt lodes. Commencing with the Leechman & Co's claim on the main or fissurs vein, discoversd in the early history of this district. It first gained notoriety in 1860 when Mr. Soulsby the pionser quartz miner of the district commenced to develop its immense wealth. The property came into the hands of the present company [Leechman & Co] in 1872, when operations were commsnced on a larger scale, a new mill was put up, the south shaft reopsned, and improvements made, costing, on an aggregate, $300,000. Nsw houses sprang up in every direction, until soon the camp contained a population greater than svsr hefore. But, once more it hsgan to show symptoms of decay, and ths new year of 1880 found her again idle.

At present an air of quietness psrvades the placs. A few men are picking ths dumps, but the mins is idle. Mr. Lsechman, the Supsrintendent, it is understood, is in Nsw York trying to dispose of the mine; and, if he is successful, hopee are entertained of his speedily going to work again. The wealth taken from this mine has heen felt directly and indirectly throughout the entire county: Directly, hy its consumption of wood and the produce of our farms, and hy the accumulated savings of many heing invested in and developing agricultnre near by. Other mines in the camp, involving the Independent, Platt and Raymond claims, have been worked from time to time. A mill on the Raymond, and other expensive machinery, have been used on it and the Platte mine. Sulphuret works of various descriptione, and a custom mill and arrastras, are usually working there; hnt all, as if in eympathy with the mother mine that gave them hirth, are idle. Preparations were made, a short time since, to work the Platt mine, but from some cause or other, it has not started yet. That a company may he found to work euch a good mine as the Soulsby, has proved itself to be, is the sincere desiro of all those that know and appreciate the benefit that it confers on our county when in active operation.

On the Independent mine operations were commenced hy the present company eix weeks ago, and they have already sunk 160 feet on the vein with the most encouraging prospects. Ou the exteusion of this vein are located the

Platt & Raymond Claime.

The former was recently purchased hy a Boeton company, which company contemplate erecting worke for the reduction of ore, etc., aud making a dividend-paying mine. The Raymond is also in progress of development. On parallel vein west, koown as the Churchill vein, are located the Churchill and Whealperrin claims. The proprietore are actively engaged in prospecting their respective claims, each company having sunk 60 feet on the vein with good showings. One mile in a westerly direction is the Draper, owned by Leechman & Co. Thè company purchased from Whitto two yeare ago, and have eince been engaged developing the mine. In yeare past immense sums of money were expended on thie mine for machinery and for making other improvements in view of opening it out; yet, with all, but little was accomplished in the way of developing—or in other words, determining the character and extent of the lode. It ie gratifying to know, however, that now the mine is in the hands of a company having unlimited means.

Barcelona Mine.—The following items are condensed from the *Belmont Courier:* At a dietance of about 1,000 feet from the mouth of the tunnel there is found a true fissure vein with well-defined walls—porphyry on the foot and slate on the hanging—the vein averages five feet in width as far as explored, viz., 50 feet in the south, and 40 feet in the north in the levels from the main tunnel, the whole distance showing a superior quality of rich sulphurets and bromide of silver. This ore is not in spots, but equally disseminated throughout the vein, and is at a depth of 470 feet on the dip of the ledge from the surface croppings. Thie strike is on the South Barcelona mine, over 600 feet south of the north line of said claim. It is believed that this body of ore will continue north through the old consolidated works, which at a depth of 180 feet from the surface in the incline has a 14-foot ledge of rich sulphuret ore.

Iron Mountain.—There is in Utah, about 60 milee southeast of Frisco district, a huge mountain of iron. It carries, possihly, the richest iron ore in the United States. The high price of material of every kind, including transportion, has rendered it worthless. Lately some of the parties who sold the great mine at Frisco for a cold million, have turned their attention to Iron Mountain, and a gentlemen from that section informs the *Sentinel* that there is a good prospect that rolling mills will he established. The near approach of the Utah Southern railroad, together with the advance in iron, leads to the helief that these great iron mines may be worked with profit. It may be that the time hae not arrived, but that Iron Mountain will, one day, he the scene of extensive and profitable iron manufacturing operations does not admit of doubt. Jay Gould is said to be interested with those who are now making experiments.—*Eureka Sentinel.*

What Mining Has Done.

"Notwithstanding the fact that mining has, until within a fsw years, never been practically and scientifically worked in California, and now only to a limitsd extent, statistics prove that from the discovery of gold in California until the present time mining has paid 18 per csnt. on the money invested. The proof hscomss all the more conclusive when it is remembered that there is and always has besn a vast amount of precious metal mined of which there nevsr can hs any estimate or record. Mining in California, under all the nnfavorable circumstances nnder which it has labored has not only paid 18 per cent. on the cost, hnt it has peopled and huilt up a mighty Stats upon the western limits of our country, filled cities in the Golden State with industry and prosperity, coversd hsr plains with flocks and her hills with vineyards, and stretched out railroads over the desert and the mountains to unite hsr to the industriss and products of the East. Mining has whitensd the Pacific with the sails of commerce, and made a new nation on the Pacific coast. This must be added to the value of mining, in addition to the mineral products, which alone is no small matter in the prosperity of our country and psople. Ws claim this for mining, because however rapidly the star of empire might take its way westward, it certainly would have yet heen years hefore its light could have reached the coasts of California." The foregoing is from the New York *Mining Review*, one of the ablest conducted mining journals in the world. This is hut a small portion of the great benefits to civilization and the world that are due to the prosecution of mining in California. Hsr hardy pioneers have penetrated to the uttermost parts of the north; have opened up Washington Territory, Oregon and Montana; the yields of precious metals which have astonished the world, and, at no distant day, will eclipse anything they have yet done. California has opened up and developed the great mineral wealth of Nevada, Utah, Arizona and New Mexico, whose mountains now teem with hardy minere, and whose yields of gold and eilver are fast approaching fahulous figures and bid fair to rival California. The mining center of the Pacific coast, whose rich valleys are fast heing brought to a state of agricultural perfection, and dotted with pleasant homes throughout their length and breadth, has made prosperoue States and filled up the tsrritories with pioneere, who, out of their wild domain, have rough-hewn civilization. She has supplied the avenues of trade of the world with a life-giving stream of gold. Her steady yield of the sinews of war carried the nation through the war of the rebellion. The great henefits California has conferred upon the Union and the world cannot be ovorestimated, and yet it is but a tithe of the great and glorious future in store for her.—*Bodie News.*

The Skagit Mines—Nothing in Them.

A correspondent writing from Seattle, Washington Territory, to the Portland *Standard*, saye: Many of the most prominent men here are bitter in their denunciation of the ring who are epreading euch exaggerated reporte broadcast over the country. The merchants have eo little faith in Skagit that they have in no inetance increased their stock of goode in anticipation of a rueh, and are carrying no heavier etock than they did last year. Your correspondent, having interviewed a number of men who have already been to Rnby Creek—eome of them old miners—comes to the following conclusione:

First—That gold has been fonnd in Ruby Creek and adjacent creeks.

Second—That it has in no instance exceeded five cents to the pan unless a pocket wae struck, and that it will not average 2½ cents to the pan.

Third—All the auriferoue region, so far as known, is already taken up and located, and those who are on the road, and also many who are already there, will have to go prospecting.

Fourth—That the route to Rnby Creek is one of great danger and peril, four men having already lost their lives, and eeveral are reported missing; 16 miles of the trail are almost impassable; in placee ropes are requisite to ecale the bluffs and ravines.

Fifth—That the report of so-called Prof. Tiernan is a colossal, exaggerated falsehood.

Several claims have already heen sold, one of 500 feet for the enormous enm of $70, and another of more than 100 feet for $20. There ie little doubt that there is a clique interested in getting up a big rush to Skagit. Their objects are not plainly apparent, unlese they are interested in eome real estate scheme. It is hinted at hy some that it is a political dodge for the purpose of getting the territory admitted to Statehood by adding thousands to the popnlation. My advice to all who have an intention of going to Skagit, is to consider well before they finally make up their minde to do eo, and to swallow all reports in regard to these diggings with a few grains of the salt of incredulity, unless they wish to be participants in another Frazer river horror.

Tuscarora is excited over a strike in the Navajo mine. The *Times-Review* says a epecimen of the oro assayed $1,800 per ton, and it is said that there is a well defined vein of it.

The miners in the Richmond, at Eureka, eay that such an extensive and rich body of ore as is now developed in that mine has never been uncovered in the district.

MECHANICAL PROGRESS.

Riveted Boiler Joints.

Rivets are usually of ¾-inch diameter, and are pitched at a distance of 1¾ inches, center to center. In thicker plates they are generally increased to ⅞ inch, or 15-16 inch; while for marine boilers and ship-plates it is at the same time a matter of opinion, whether, with a proportional pitch, increasing the diameter of a rivet is any advantage. From the results of experiment and practice, ¾-inch and ⅞-inch plates, riveted with ¾-inch rivets at 2-inch pitch, were found to be as strong as entire plates of the same thickness; with thinner plates, a shorter pitch of 1¾ inches, with ¾-inch rivets, or 15-8-inch with 11-16-inch rivets, it is proved that it is not only strength of joint, but tightness of seam, as expressed by Mr. Fairbairn. A great deal has been said and written on the superiority of drilled over punched plates, and machines of a costly type have been constructed for the purpose of drilling boiler and ship-plates; but it can be proved that punched rivet holes, when fairly and truly fitted, are as good as, if not better than drilled holes, for the following reason: As the punched hole is always conical, generally about 1-16 inch to 3-32 inch, when the plates are fitted with the taper or cone of the holes reversed, the rivet hole has the form of a double cone, causing the lines of strain to converge through the plates and thus shortening the leverage, and so far stiffening the joint. It is well known that slightly countersinking the holes, as is done in Messrs. Beyer and Peacock's boilers, improves the joint; and on the same principle, Sir D. Gooch anticipated the twisting of the single-riveted joint, so as to have less liability to distortion under pressure and work.

Long rivets are objectionable, and extra work may be judiciously applied to avoid them. At the junction of the fire-box and the shell at the door long rivets were formerly common, the old way in making the fire-box door being to forge a ring of the length and diameter required, and the thickness of the water space, long rivets being fastened inside and outside the shell of the fire-box through the ring. Mr. Beattie constructs the fire-door with a ring of boiler-plate, which was flanged and riveted to the fire-box, and separately riveted to the shell with angle iron, short rivets being used throughout. Mr. Beattie also forms the junction of the fire-box and combustion chamber of his coal-burning engines, with a ring turned and flanged out of plate with flanges, one of which is riveted to the fire-box, and the other, for want of access to the rivets, being joined and fastened to the combustion chamber. For the same reason, Mr. Hackworth made his junction of the bottom of the fire-box with a piece of boiler-plate doubled, separate riveting being a better arrangement than that made with a solid bar, as was formerly done. This last form of junction is also better for the circulation of water and equalization of expansion.

In the seams of the fire-box, double riveting is detrimental, as the long lap required for the double row is liable to burn and produce unequal expansion, which leads to leaking. On the question of strength, the fire-box is so thoroughly stayed that very little tensile strain is thrown on the joint. Mr. Dewrance found that the ends of the stay-bolts made with square heads, projecting 2½ inches into the fire-box, burned off to a projection of only 1¼ inches, at which point they remained.—*Universal Engineer.*

NEW METHOD OF MAKING BELTS.—A firm in Paris has devised a new method for manufacturing belts or bands for machinery, which is applicable to rubber, leather, woven tissues or gutta-percha, and consists in making the belt with longitudinal ribs or grooves, the main object of which is to increase the capacity of the belt of the same cross-section, say twelve inches, by the extra strength put in the same place, and also to prevent so much stretching and variation. Another modification of the same invention is grooving one side of the belt the same as saw teeth, then putting these two pieces together, leaving a plain bearing surface for contact beside, thus making a double belt which is less liable to stretch or to warp. Especial machinery is built for the purpose, and the claim for it is that better contact is given. The pores are closed during this grooving process, the belts have a higher resisting power, do not twist on the pulleys, the pressure and friction of the grooving process smooths and polishes the surface so that better contact and adherence is had. The grooves may be made regular, irregular, spiral or crossed.

A MILL-OWNER says:—Eelskins make the best possible strings for lacing belts. One lace will outlast any belt, and will stand wear and hard usage where hooks or any other fastening fail. Our mill being on the bank of the river, we keep a net set for eels, which, when wanted, are taken out in the morning and skinned, and the skins are stuck on a smooth board. When dry, we cut them in two strings, making the eelskin, in three hours from the time the fish is taken from the water, travel in a belt.

INCREASED USES FOR GLASS.—Considerable has been written about toughened glass as a material for railway sleepers, and now Mr. Bucknall, of England, intends to manufacture toughened glass pipes for water and gas works, for drains and chemical purposes, as well as transparent bricks, telegraph insulators, etc.

Boiler Explosions in England.

Mr. Fletcher, the chief engineer of the Manchester (England) Steam Users' Association for the Prevention of Steam-Boiler Explosions, has just issued a most excellent and practical report upon this subject, and we find that during the year 1879 there was no fewer than 25 serious boiler explosions, causing the deaths of 40 persons, and injuries to 52 others. Of the above total, 9 explosions seem to have been due to defective condition; 5 to excessive pressure; 4 to malconstruction, coupled with defective condition; 3 to malconstruction, alone; 2 to over-heating through shortness of water; and 1 to caulking under steam pressure. Besides the above there were 22 minor explosions, killing 15 and injuring 36 persons, included in the number being 12 kitchen and circulating boiler explosions—most of which Mr. Fletcher believes might have been prevented by the use of a small reliable safety-valve.

The active causes of these lamentable occurrences—they can scarcely be termed accidents—seem to be 3 in number, namely (1) Faulty construction; (2) absence of regular inspection, and (3) carelessness in usage. On the first head there should be no room for doubt or mistakes in the present state of our mechanical skill and knowledge. The second requirement should be, by legal enactment, made compulsory. The third want is one which no legislation can meet, but it is worthy of notice, that of the 25 principal explosions last year only 2 were traced to over-heating through shortness of water, so that this cause may be considered the least important of the trio, apart from which it is obvious that considerations of personal safety will always tend to keep this risk within due limits. Mr. Fletcher remarks, "the causes of boiler explosions are really very simple," and we cordially unite with him in enjoining upon all users of steam power the necessity of having their boilers periodically inspected, as being the means of all others of preventing the appalling occurrences which every now and then shock the community.

One-Story Factory Building.

The new discussion in reference to mill architecture is still attracting much attention in New England, and important changes are looked for in the near future in the substitution of one-story buildings for the high structures heretofore employed. This idea is about to be carried out on a large scale by the Willimantic Linen Company of Connecticut. The design contemplates having all the work done on one floor, the machinery to be run by shafting in the basement, and the power to be supplied from engines in the engine house behind the main building. By so bringing all the operations together, it is claimed that there is a very great saving of labor.

The area of the contemplated building is nearly three and a half acres, its ground dimensions being 820 by 172 feet. There will also be an annex at each end of 70 by 50 feet. The hight of the main building from the water table to the eaves is to be 16 feet, and there will be three towers, each 40 feet high, with provisions for ventilation in the piers.

Mill owners and managers will watch this experiment with interest, and undoubtedly many of the architectural ideas involved in this plan will be adopted and carried into effect in the erection of great mills in the future. Where land can be obtained at a reasonable price, the advantages to be obtained in the way of plenty light, good ventilation, convenience, and safety in case of fire, speak strongly in favor of the adoption of one-story factories, especially if this can be secured without sacrificing architectural beauty.

A NEW CASK AND BARREL HOOP.—Advertisements have recently appeared in several journals and a patent taken out for a barrel hoop made of wire bent into corrugations, so that it has a serpentine form. It is claimed that this hoop, when driven upon a dry barrel or tub, will compress and hold the staves tightly together, like the ordinary stave hoop, but will have elasticity or spring enough to stretch when the staves expand by moisture, and return to its former position when the staves again contract on becoming dry; in this way the hoops will adapt themselves to the expansion and contraction of the barrel and the annoyance of loose or bursting hoops will be avoided. By forming the corrugations to rest flatwise against the staves, no obstruction is offered to rolling in case of barrels, while a much greater amount of friction surface is brought to bear upon the staves, increasing their holding power. The ends of the wire are secured together by the twisting of one end around the other. These hoops, being made of wire, will withstand corrosion much better than flat hoops, as less metal comes in contact with the wood and less opportunity is afforded for the retention of moisture.

HARDENING SMALL TOOLS.—It is said that the engravers and watchmakers of Germany harden their tools in sealing wax. The tool is heated to whiteness and plunged into the wax, withdrawn after an instant and plunged in again, the process being repeated until the steel is too cold to enter the wax. The steel is said to become, after this process, almost as hard as the diamond, and when touched with a little oil or turpentine the tools are excellent for engraving, and also for piercing the hardest metals.

SCIENTIFIC PROGRESS.

An Expert's Story of the Missouri Tornado.

Prof. John H. Tice, the well-known meteorologist, who went to Marshfield to investigate the phenomena connected with the late storm, telegraphed the St. Louis *Republican* as follows:

"Everywhere along the track of the tornado there is evidence of a wave of water flowing in the rear of the cloud spouts. At some places there are only faint traces of such a wave. At others the debris is carried up and over obstructions two or three feet high. These waves or currents flowed in the greatest volume up hills. There are places where the entire top soil is washed away by the currents. Fibrous roots and tufts of grass show their direction to have been up hill, and what is more significant, from all points of the compass toward the top of the hill when the tornado was raging at the time and expending its force. No trace at any point can be found where they flowed down-hill. Many level places are swept clean of soil. Leaves, grass, debris of wrecked buildings and fragments of planks carried along by the current and left in its track, arranged themselves longitudinally to the current.

"The following is vouched for by George Gilbert of this place: He and his wife and four children were on a visit eight miles in the country, and the center of the tornado passed within five or six yards from where they were. A wave of water, apparently 15 feet high, rolled in the rear of the point of contact of the cloud spout with the earth. It rolled over them in a second, and was icy cold, drenching them thoroughly. About two miles northeast of the town, stones weighing from 500 to 700 pounds were lifted out of the earth and carried along some distance in the track of the tornado.

"J. H. Williams, presiding Justice of the County Court and residing in Panther Creek valley, tells me a stone fell in the center of a field belonging to H. Rose, the weight of which was estimated at two tons. It is not known whence it came."

The tornado, so far as is known, commenced in Arkansas, in Stone county. In Crow Creek settlement 10 persons were killed, and on Flat creek six persons were killed.

NEW (?) METALLIC ELEMENTS.—Seguin Scacchi, an Italian chemist, has detected what he affirms to be a new element in certain ancient Vesuvian lavas. The alleged new body appears from the description to be allied to vanadium and molybdenum. He proposes to give it the name of *Vesbium*, from the ancient name of Vesuvius. The particular occurrence of this alleged new body is in certain green and yellow incrustations occurring on the lava of 1631. Herr Dahl is again to the fore with some additional particulars of his recently-announced element. This, it may be remembered, he observed in the red nickel pyrites of Kragerœ, and proposed for it the name *Norewgium*. In the present communication he appears to have succeeded in isolating it, and to have determined its physical and chemical characteristics with sufficient certainty to establish the genuineness of his claim to the discovery of a new element. Norwegium, he states, is white; not very ductile; sp. gr., 9.44; melting-point,, 350° C. (662° Fahr.); and is dissolved in nitric acid with a blue color, which becomes green on dilution. Its solutions are precipitated green by alkalies, but the precipitate dissolves in excess. Sulphureted hydrogen gives a permanent brown precipitate. Before the blow-pipe, it gives yellow glasses, which become blue on cooling.

CAUSES OF FATIGUE IN READING.—An important study has been made of this subject by Dr. Javal, Director of the Laboratory of Ophthalmology of the Sorbonne, published in the *Annales d'Oculistique*. The fatigue of the eyes which is so often complained of by literary men he believes due to a permanent tension of accommodation. Reading requires constant, steady strain of the eyes, while many other occupations demanding close attention, do not need constant sight. His researches extend to the question of great economical importance: Given a surface of paper and a number of words to print upon it, what rule will secure the maximum of legibility? The answer is: Other things being equal, the legibility of a printed page does not depend on the height of the letters, but on their breadth. This fact is of special importance in the preparation of school books, and Dr. Javal's suggestions should receive the attention of publishers, type founders and school boards.

ELECTRIC PHENOMENON.—E. Lamaire observed the following phenomenon during a snow storm: The wind was blowing from E. S. E., the sky being very cloudy and the thermometer was standing at 1° below zero (30.2° F). At the beginning of a violent squall of snow little luminous points appeared at the extremity of each of the iron ribs of his umbrella, accompanied by a rustling similar to the buzzing of an insect. When he approached his ungloved hand to one of these points he felt a slight shock in the first two fingers, and the light disappeared. The experiment was repeated many times, and the phenomenon lasted four or five minutes, until the umbrella was covered with a thin coat of snow.—*Comptes Rendus.*

Important Spectroscopic Observations.

In a late paper, sent to the German Chemical Society, Herr H. W. Vogel makes the interesting announcement that he has succeeded in detecting a number of new lines hitherto not noticed in the spectrum of hydrogen. Up to this time, it has been held that the hydrogen spectrum consisted essentially of four lines. Vogel took a number of photographs of the spectrum of hydrogen in Geisslor tubes filled with the gas, and obtained, along the four lines already known, a great number of others, among which several of the violet and ultra-violet were remarkable for their intensity and definiteness. To make sure that these new lines pertained to hydrogen, the author repeatedly photographed the spectrum of electrolytic hydrogen concerning whose purity he entertained no doubt. Among these new lines, one is particularly remarkable for its brightness and for the fact of its coincidence with Fraunhofer's line H', generally attributed to calcium, to which body Fraunhofer's line H" also belongs. From the existence of this conspicuous line, which he designates as the fifth hydrogen line (Hδε), Vogel draws some interesting conclusions bearing on Lockyer's alleged discovery of the dissociation of calcium at high temperature.

From the fact that the spectrum of calcium becomes modified at high temperatures, Lockyer has conjectured that this body becomes dissociated at such temperatures into two elements, X and Y, to one of which the first H-line belongs, and the second to the other. He has not, however, thus far succeeded in actually effecting this dissociation by artificial heat. He believes, however, that this takes place in the high temperature of the "white" fixed stars, and depends for this belief on Huggins' spectra of Sirius and Vega, in both of which the first of the H-lines is present, while the second is either altogether absent or hardly recognizable. Vogel explains this fact differently, and ascribes the solitary H' line seen in the star spectra, not to calcium, but holds it to be the fifth hydrogen line. He is supported in this inference by the fact that in Huggins' star-lines in violet and ultra-violet, in addition to the well-known hydrogen lines, there are many others which agree so manifestly with those observed in his photographs that he holds their identity to be beyond doubt. He therefore affirms his belief that Lockyer's conclusion as to the dissociation of calcium, based on spectrum observations, is not justified, and that, on the other hand, the isolated appearance of the H'-line (without H") is simply the fifth line of hydrogen, which he has discovered.

DISTRIBUTION OF ATMOSPHERIC PRESSURE.—L. T. de Bort calls attention to the fact that in two columns of air, which have the same pressure at the surface of the ground, if the temperatures are different the decrease of pressure in the higher levels is slower in the warmer column. Hence results a tendency of the air to pass from the warmer to the colder column, accompanied by a falling barometer in the former and a rising barometer in the latter. The effects of difference of temperature being generally opposite to those of barometer pressure, the transfer of air may be effected in the upper atmosphere, even when the pressure is lower at the bottom of the column. The ocean currents, in winter, augment the energy of the atmospheric disturbances by increasing the opposition which already exists between the continental and oceanic temperatures.—*Comptes Rendus.*

A NEW and powerful thermo-electric battery which is spoken of in terms of the highest praise in the French journals, has been devised by M. Clamond, whose name is already associated with the substantial improvement of this class of apparatus. The apparatus referred to could not be understood without an illustration and description of special features, and for these we refer our readers to the pages of *La Nature* (Paris) for January 17th. It must suffice to say here that the apparatus is designed to produce electricity by the direct transformation of heat, and has demonstrated its utility for this purpose beyond question. The largest apparatus thus far constructed by M. Clamond is composed of 6,000 couples, with which he has been able to run two Sorrin electric lamps yielding a light of from 800 to 1,000 candles for each lamp, with the consumption of 8 to 10 kilos (17-5 to 22 pounds) of coal per hour.

FALL OF METEORIC DUST.—Prof. Silvestria, of the Catania observatory, reports the fall on the night of the 29th of March of a shower of meteoric dust, mingled with rain. Besides the usual characteristics of color, chemical composition, and the mixture of mineral and organic particles and minute infusoria, there was a considerable proportion of iron, either in a purely metallic state or in metallic particles, coated with oxide. The size varied from a tenth to a hundredth part of a millimeter, and the form was either irregular or spherical, as if it had undergone fusion. This phenomenon was first observed in the Indian ocean, south of Java, in 1859, and has been corroborated by Prof. Nordenskjold's Arctic observations.

M. L. COLLOTT has discovered the true *Phylloxera vastatrix* upon *Vitis caribbæa*, a wild species of vine found in the forests of Panama, far removed from any vineyards or localities where the true vine (*V. vinifera*) is cultivated. This strongly confirms the opinion that the *phylloxera* is indigenous in America.

The Mining Share Market.

The prices of mining stocks this week were in some instances lower than they have been in two years. Compared with the highest rates at the end of last week, the minimum figures showed a downward tendency at the opening of the week, but as we go to press a slight reaction seems to have set in. The necessity for economy is apparent on every side. Should the present depression continue much longer, the salaries and current expenses will suffer a material reduction. Those who have large interests at stake on the Comstock, are much concerned what to do. There is serious thought of working the low-grade ores of the upper levels, which cannot be handled without a decided reduction of expenses. Work must be done on a large scale, and at the lowest possible rates. The next thing to consider is means of cheaply pulverizing and concentrating this ore, in which operation there is still a grand field for inventors. It is rather generally believed that the end of stock speculation is close at hand—so complete is the demoralization in the speculative ranks.

The water question in the middle Comstock mines is evidently a serious one. The Gold Hill *News* is of the opinion that the stream which flows into the 2200 level of the Savage is a living oue, otherwise it would have been exhausted long ago. The raising of its influx to the Sutro tunnel level devolves mostly now upon the Hale & Norcross pumps, since Savage has enough in its incline for its own pumps to handle. Chollar has plenty to do to take care of its own water and that from the 2400 level of Savage. There is a prospect, however, of exhausting both the latter inflows, consequently of soon resuming operations on the 2400 level. Belcher, too, has found an increased flow while endeavoring to prospect with the drill further east on the 3000 level. This puts off for a time the knowledge of what lies in the vein of that mine on that level.

The House Committee on Commerce has agreed to recommend an appropriation of $50,000 for the improvement to the entrance of Yuquma bay on our coast.

By three steamships, 3,139 immigrants arrived at New York on the 10th inst.

Quarterly Assessment of Noted Nevada Mines.

Following is an abstract statement from the quarterly assessment roll of the proceeds of the mines of Storey county, Nevada, for the quarter ending March 31, 1880: Belcher mining company, 767 tons of ore extracted; value, $13 per ton; gross yield of value, $9,995.32; cost of reduction, $5,752.50; total cost, $11,062; net yield or value on which taxes are levied, $1,999.06. California mining company, 8,799 tons of ore extracted; value, $26 per ton; gross value, $232,499.43; cost of reduction, $204,752.17; total cost, $204,752.17; net yield, $46,489.88. Consolidated Virginia mining company, 13,777 tons of ore extracted; value, $34 per ton; gross value, $473,776.86; cost of reduction, $322,340.53; total cost, $322,340.53; net yield, $186,500.74. Consolidated Imperial mining company, 3,026 tons of ore extracted; value, $13 per ton; gross value, $35,581.80; cost of reduction, $21,017.10; total cost, $42,698.95; net yield, $7,716.36. Monte Cristo mine, 450 tons of ore extracted; value, $10 per ton; gross value, $4,450; cost of reduction, $2,250; total cost, $4,500; net yield, $445. Ophir mining company, 4,209 tons of ore extracted; value, $33 per ton; gross value, $138,026.19; cost of reducing, $37,888.20; total cost, $226,707.26; net yield, $55,210.47. Savage mining company, 23 tons of ore extracted; value, $35 per ton; gross value, $804.62; cost of reduction, $196; total cost, $2,196; net yield, $32,184. Sierra Nevada mining compauy, 972 tons of ore extracted; valne, $47 per ton; gross value, $46,389.13; cost of reduction, $8,449.12; total cost, $208,773.11; net yield, $18,555.65. Union Consolidated mining company, 17,089 tons of ore extracted; value, $39 per tou; gross value, $674,346.72; cost of reduction, $153,802.35; total cost, $415,230.36; net yield, $269,738.68.

Eureka, Humboldt county, is exercised over the discovery of a wonderful cave of mammoth proportions, about three hours' ride from Graberville. The mouth of the cave is about 700 feet above the bed of the South Fork, on the west side, and up the precipitous east side of Bear Buttes.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

BUTTE.

Good Mining Scheme.—Chico *Record*, May 8: If the reader will turn to the map of Butte county, he will see that on the line between township 21 and 22 north, and range 3 and 4 east, the North Fork makes a big bend to the east, coming around again on the general course of the river some 3 miles below. The proposition is to tunnel through on the general line of the river, and turn the stream through, thus drawing some 11 miles of the main channel of the North Fork. The tunnel will have to be only about 1 mile in length, when it will strike a ravine that will carry it into the West Branch, and thence into the old channel of the North Fork. It is believed that this will open one of the richest and most extensive river mining claims ever known, and cannot fail to be profitable. The matter is, we understand, in the hands of New York capitalists, and will be commenced at an early day. It is expected that it will take a year to drive the tunnel and erect the dam so that the river can be tunneled. It is a magnificent scheme, and we hope to see it inaugurated at once.

Good Clean-up.—*Register*, May 7: The Powers claim, opposite town, cleaned up last week, and for an 11-day run realized 35 pounds of amalgam, worth about $100 per pound. This result was the work of 4 men and about 1,000 inches of water. The present clean-up is not an unusual one, as the claim has been paying steadily ever since it was put in working order by the present owners. No mine in the county can show better results for the labor and capital invested than the Powers & Co. mine. This mine, while less talked about than any of the hydraulic mines in the county, consists of 1,500 acres, with a perfect title derived from the confirmed Fernandez Mexican grant. The mine was worked for several years by its former owner, M. B. West, in a small way, having to depend on the rains for his supply of water, who became rich upon the proceeds. About 4 years ago, Powers and his partner, being practical hydraulic miners, purchased the property for, we believe, $50,000, and went to work, and with an outlay of about $25,000 put the mine in excellent working order. From which time until the present it has not failed to yield a handsome return. We have it from a source which we deem reliable, that in the 2 and little more years it has been worked by the Powers' company, it has paid back to its owners nearly ¾ of the $76,000 invested, besides paying interest at the rate of 12% on half the purchase money, as well as the money borrowed to pay for the improvements made before commencing work. The 1,600 acres probably averages in depth 76 ft. The entire ground has been prospected from shafts sunk in every direction, hence the value of the mine is no longer a matter of speculation. Notwithstanding the 2 years working, and the amount of gold taken out, scarcely an impression has been made towards exhausting the mine. It is safe to say that 100 years of constant work, with the amount of water now used, would not exhaust it. Was this mine located on the eastern border of Idaho or in the mountains of Plumas county where it could only be worked 6 months in the year, on account of snow and ice, with distance or lead equipment to the view, instead of within rifle shot of the court house at Oroville, we think it no exaggeration to say that it would have been purchased by Eastern capitalists before this time.

EL DORADO.

Pilot Hill Mines.—El Dorado *Republican*, May 4: I know of no mining locality that offers better indu ements in quartz operations than the Pilot Hill district, and a fair trial and the introduction of a quartz mill will soon make it a favorite camp; it is, therefore, with no ordinary degree of satisfaction, that I glean that Mr. F. C. Leavitt has contracted for the purchase of two quartz locations at Hogg's diggings. The Louisiana is the first western extension of the Hunt quartz mine (patented) on the Hunt ledge, and is situated on the hill south of Hogg's Diggings Flat, famous for the rich surface on it, and in Indiana ravine, which runs from the ledge on to the flat, and the immense nuggets that have been extracted therefrom, and some of which are occasionally found yet. The ledge in the Louisiana prospects well in free gold, and coutains iron pyrites and copper sulphurets. In early days the croppings all along this ledge were worked in a small mill, yielding an average of $15 per ton, but the mill ceased to work in '58-9, and soon disappeared; gold was plentiful in the ravines and flats, and quartz mining was little known or sought after. Little work has since been done for the want of machinery; but Mr. Raimundo, with ever-abiding faith in the future, has held on to his locations, in the hope of some day being able to work them, and after 25 years' residence hopes now to see his dreams realized by the proof that the quartz ledges in the hills contain more wealth than has ever been obtained from the rich alluvial deposits in the flats and ravines surrounding them. The other mine is the Josephine, located about a mile northwest from the former, across Knickerbocker creek. Mr. Raimundo, some years ago, hauled several tons of ore from this mine to Ophir, Placer county, for reduction, and obtained a result of $25 per ton. Wood is quite plentiful in the vicinity of these mines, and water available. I understand the price is $5,000 for each mine. A commencement being made, attention to other locations in the neighborhood will ensue, and several of them, especially the Pilot Hill mine, Buchan & Co.'s location, in Folsom ravine, are very promising.

Spanish Dry Diggings.—Mr. George Bower informed me on Tuesday last that he had purchased the Ricci & Co. mine at this place. This has been a remunerative mine since 1856, and now requires capital and machinery to work it more efficiently and profitably.

The Seam Belt.—Mr. Desmarais has will recommence washing in the French claim to-morrow. Mr. White, of San Francisco, will commence this week a tunnel to run to the seam belt from American canyon on the claim adjoining the Bower mine to the north.

Rich.—*Mountain Democrat*, May 8: Last Tuesday a couple of strangers brought 1,500 pounds of quartz to the Griffith consolidated mill, near Diamond Springs. Griffith had it crushed, and it yielded 31 pounds of retorted amalgam, worth about $3,000. The men said they had only been six days on the ground from which this rock was taken, and had only been two days taking it out. Young men, or old men either, for that matter, had better make a note of this and start out on a pocket hunt. Two thousand dollars a day to the hand is good wages. We doubt whether Skagit is any better.

INYO.

Cerro Gordo.—*Independent*, May 8: Mr. Wm. Crapo has had a good force at work on the Crapo property—the old Buena Vista ledge at Cerro Gordo—drifting into its immense croppings preparatory to sinking. The outcrop is visible as far as Buena Vista mountain can be seen, and consists of an ore body 300 ft in length and from 30 to 50 ft wide, sampling $102 per ton in silver and gold. It would require years for a 20-stamp mill to make a respectable hole in this bonanza, which is pronounced by all mining men who have seen it as almost marvelous in its extent.

KERN.

Antimony.—*Californian*, May 6: Mr. Stephen Boushoy was in town on Tuesday; he had just returned from his San Emidio antimony mine, which he reported to be in excellent condition. He has bought the rights of the other owners, and now claims to be the sole owner. He has bonded the mine to some Philadelphia capitalists for $300,000, and he left here on Tuesday night for the East to consummate the sale. This mineral has advanced very much in price, and is now quoted at 21 to 22 cents per pound. His mine is said to be very rich. The new pur-

chasers are said to have abundance of means, and intend to commence work in July, when they will probably have 150 miners at the scene of operations. Mr. Boushey thinks very favorably of the James one-track railroad, and believes it will be of great usefulness in taking supplies to and in bringing ore from the mine.

LOS ANGELES.

SANCHEZ MINE.—Mr. Jose Sanchez has returned from the Mohave mining district with very rich and remarkable specimens of galena and silver ore from the Sanchez mine. The ledge is 4 ft in width, and has been traced 1,000 ft. It has been prospected to a depth of 10 ft, and shows astonishing richness. In a few days teams will be sent to the mine and a shipment of ore made to San Francisco for sale. An assay last week of the Champion, Chieftain, Noble, Soledad, Troubadour and Empress mines yielded on an average $35.39 per ton. This great mining district should be a source of great profit to Los Angeles. A furnace will be put up immediately, and as there is plenty of wood, the work of reduction will proceed without delay.

MONO.

LAST CHANCE.—*Chronicle*, May 8: The crosscut from station on 300 level has been advanced during the past week 12 ft; total length, 20 ft, with no change to note in formation. A vein about 2 ft in width was cut when about 12 ft from station, and pitching slightly to the west. This vein has good clay walls, and the vein matter is quartz and clay, some of which gives fair milling assays. The vein possesses every characteristic of being a permanent one.

HOMER M. & M. Co.—The east crosscut from the Cravasse tunnel has reached a distance of 42 ft from the starting point; face of the work is in good blasting ground, with no change to note in formation. The west crosscut, from same tunnel, is in 144 ft; rock is somewhat harder, and progress correspondingly slow.

TIOGA.—The east crosscut, 800 level, was advanced 14 ft during the past week. A vein of quartz 2 ft wide has been cut through, which prospects very well by the horn process. Assays are being made from this vein. West crosscut, same level, has had 27 ft added to its length since last report. There is considerable quartz coming in on the face of this drift, and the porphyry is very favorable in character.

KING BEE.—*Free Press*, May 9: The recent developments in the North Noonday and Oro mines have lent new interest to mining operations in that section. Among the most eligible located mines to the south of the Noonday is the King Bee. It is situated on the eastern slope of Queen Bee hill, is bounded on the north by the Noonday, Booker and Spaulding mines, and on the east by the Maryland Con. and Boston Con. The tunnel was run into the hill 445 ft, in which direction 5 ledges were cut, of various sizes and values. The first 3 are from 1 ft to 18 inches in width, of quartz and clay mixed, from which good assays are obtained. The 4th vein is the principal feature of the property. It is 12 ft in width from wall to wall, of clay, quartz and vein matter, the quartz largely predominating. The vein has an easterly pitch of about 75°, and on the hanging wall side has a blue clay wall about 1 ft in width —such a wall as on the Comstock would be considered a most favorable feature. A vertical shaft was started about 300 ft southeast of the mouth of the tunnel, up the hill, which has now attained a depth of 250 ft. At a depth of 145 ft a ledge was cut about 18 inches in width, pitching east at about an angle of 75°. It is nearly clean ore, some of which is high grade. Seams and stringers of quartz, all giving assays, were frequently cut in sinking. At the bottom, crosscuts have been started east and west. That to the east is in about 18 ft in very hard rock; that to the west is in 24 ft, in a porphyry formation of a favorable character.

NEVADA.

VULCAN.—Grass Valley *Union*, May 8: The Vulcan mining company will have their new 6-inch steam pump in place and ready to start up during next week. The prospect shaft is down 100 ft, and has a considerable depth of water standing in it, but this will be taken out in a few days when the pump commences work.

THE new and fine hoisting works of the Fortune mining company, in the Nevada district, are in a state of forwardness. Superintendent Fred Jones is taking advantage of the favorable weather to rush the work.

SUPERINTENDENT PERRINS, of the North Bloomfield mining company, accompanied by a formidable guard, arrived in Nevada City yesterday with a big clean-up of bullion from the mine.

TO RESUME WORK.—*Transcript*,, May 6: Satisfactory arrangements having been made, work will be resumed this week in reopening the tunnel of the Phœnix (old Cunningham) quartz mine. Francis Burns will act as Superintendent.

MIDDLETON.—The new 4-stamp mill of Eureka No. 2 mining company, built by Otis Holbrook, was started yesterday morning. The machinery works splendidly. There are 200 tons of ore on the dump.

PLACER.

MINERS ON A STRIKE.—Nevada City *Transcript*, May 11: The Eastern capitalists who recently purchased the Rising Sun quartz mine at Colfax, gave notice that on and after yesterday the wages of underground miners employed by them would be $2.50 a day instead of $3 as heretofore. The men whose interests were to be affected by this change, numbering about 25 in all, refused to go to work yesterday morning, and the result is that no ore has been extracted from the ledge during the past 24 hours. The striking miners say they will not return to work at the reduced prices, and that they will not permit other parties to do so. The manager of the property is determined that he will have his own way about the matter, and a gentleman who came from the scene of dispute yesterday says there is a prospect of trouble. The men employed above ground are all at their posts as usual.

PLUMAS.

BIG IRON CONTRACT.—Plumas *National*, May 8: H. C. Bidwell, President of the Green Mountain company, has recently concluded a contract with Messrs. Manson & Co., of the Greenville Iron Works, for all the machinery necessary to equip the new 60-stamp mill which the company proposo to erect this summer. The castings are to be completed by the 15th of July, and will cost the company about $22,500 at the foundry. The total weight of the castings will be nearly 200 tons. All the modern improvements will be introduced in constructing the batteries, ore-breakers, self-feeders and amalgamating appliances, and the mill, when finished, will be a model one. We are promised a full description of it, before a great while, for publication.

THE GREEN MOUNTAIN mill last week cleaned up $8,300 for a run of 20 days with 32 stamps. The run paid about $10 per ton, and there is a mountain of the same kind in sight in the mine. The Green Mountain is giving strong evidences of being one of the largest quartz mines in the State.

THE Plumas ditch company is piping with a big head of water.

TUOLUMNE.

CONFIDENCE MINE.—*Union-Democrat*, May 5: The find of a rich lead in this mine some months ago has been verified by running several hundred feet on the chute, which at times pinched out. It is now opened 125 ft on the 800 level, on a continuous chute of high-grade ore, showing gold to the naked eye. Another new development was made about two months ago on the same level, when, in the body of broken vein matter, after driving upward about 60 ft, a 3 ft vein was found, upon which a drift has been run 40 ft, opening a large body of ore that will pay from $25 to $100 per ton. The mill has remained idle the past three or four months for want of a supply of wood. It will be put in operation on Monday next. There is 700 tons of ore now in the mill that will pay $15 per ton, which was taken out prior to the recent discoveries. The outlook for the old Confidence, for returning a handsome sum to its owners, was never better in its palmiest days. Under the management of J. A. Davis, who evinces good mining sense, with William Symons as Superintendent, the mine will be made to yield up what is in it.

ROBERTS.—Work will be commenced at the Rodgers mine, on Piety hill, next Monday. It will take several days to free the mine from water. The incline, which is down some 130 ft, runs all the way on a well-defined vein. Some of the last ore taken out, when the water made too rapid for work in the mine, shows gold We saw two pieces that was picked off the pile that gave good evidence that required no glasses to see where nature had placed the shining metal.

A SHAFT is being sunk on the Rappahanock mine that joins the Raw Hide. The shaft is down about 25 ft, the ore showing good prospects. Divoll and Davis intend to know the value of this mine.

NEVADA.

WASHOE DISTRICT.

UNION CON.—Gold Hill *News*, May 12: The drift on the 2500 level, to connect No. 1 winze with the 2500 station of the Sierra Nevada incline, is in heavy vein matter carrying quartz giving low assays; total length, 65 ft. A drift has just been started from No. 1 winze south on this level to connect with winze No. 2 when it reaches the required depth. Winze No. 2, from the 2400 level, is down 16 ft and in hard vein matter. Sinking has been resumed at the Union shaft.

CALIFORNIA.—Ore averaging $30 per ton is found east of the old stopes on the 1500 level, and will be extracted. The drift north on the 2300 level to connect with that south from the Ophir line and to complete the connection through to the Union shaft on that level is in 60 ft and in a heavy vein formation of clay and quartz.

OPHIR.—The north drift, 2500 level, 330 ft east of the incline, continues in a heavy vein material consisting of clay and quartz, which promises well; total length from the main east drift, 45 ft. This formation gives assays of from $5 to $20.

BEST & BELCHER.—The work of continuing the G. & C. and B. & B. shaft on down makes good progress; total depth, 1,110 ft.

SUTRO TUNNEL.—Excellent progress is being made in the headers of both lateral branches. The main track in the tunnel is being put in condition for the use of the air motors, and they will soon be running to the connection with the north lateral branch.

CON VIRGINIA.—The joint California crosscut on the 2300 level still penetrates a heavy vein formation carrying clay and quartz; total length 112 ft. The C. & C. shaft is 50 ft below the 2300 station. The west drift from the C. & C. shaft, and 30 ft above the 1750 level, is in 70 ft; total distance to run 89 ft. The usual extraction of ores is going on in the stopes on 1750 and 1550 levels.

SIERRA NEVADA.—On the 2300 level the west crosscut on the line of the main shaft is now 62 ft from the main lateral drift. No change of material. The crosscut east, opposite the east winze, is now in 100 ft, and in vein porphyry, mixed with quartz and looking well.

CHOLLAR.—Still pumping and bailing. The ratio of decrease of water noted Saturday—180,000 gallons per day—has not continued, so that it is entirely uncertain when the tanks can be taken off and work resumed in the Chollar south drift.

YELLOW JACKET.—The diamond drill is being sent down below the 3000 level to prospect for work and preparatory to dropping the shaft down 66 ft further, that being the same depth as the 3000 of the Belcher and Crown Point. The work of drilling has been interfered with by the necessity of again bailing the Con. Imperial water, the Belcher having taken it, and when it received a new flow on the 3000 level having turned it back to the Jacket shaft.

JUSTICE.—The east and west crosscuts from the main south drift on the 1650 level are being pushed ahead and are both making good progress through favorable vein matter containing occasional bunches of good ore.

EUREKA DISTRICT.

EAGLE CON.—Eureka *Sentinel*, May 9: While sinking an incline shaft on the Eagle Con. mines, H. S. Ferloy opened up a large cave, which seems to be at least 75 or 100 ft deep. At the opening of the cave several bunches of good carbonate ore have been taken out, and it is hoped that Mr. Farley will soon uncover a large deposit of ore.

THE Ventnre series of mines consistiug of 3 claims, situated on the northwest slope of Adams hill, and owned by Capt. Potter, Superintendent of the British mining and milling company, are bonded to a firm in New York, who expect to make a sale at an early day.

IN THE K K, drifts are being extended to connect with the Eureka Con. Connections will be made with the 5th, 9th and 11th levels of the latter, thus facilitating operations in both mines.

NUMEROUS PROSPECTORS are hunting up eligible locations along the western slope of Prospect mountain and the foothills in Spring valley.

THE Mountain Boy has a quantity of good ore on the dump, and will soon commence to ship to the Richmond reduction works. H. C. Kirkpatrick and e few others are now working the mine on lease.

THE owners of the Lillio L have started a tunnel to tap the 2 ledges 150 ft from the surface. By running the tunnel 225 ft it will strike the ledge about 70 ft from the starting point.

THE Atlantic & Pacific company have started a tunnel to develop their claims on east side of Prospect mountain, near the Fourth of July mine. They will have to run 500 ft before reaching their own ground.

THE Jackson new shaft is now down 670 ft. At the 720 level, drifting will be commenced. A little water has been encountered, but it is easily handled.

THE owners of the Alexandria have purchased machinery in the East, and the same will be placed over the shaft on its arrival here in a few weeks.

THE building and machinery are being put in place on the Wales Con., and steam is to be gotten up in 2 weeks.

THE Rescue mine is closed down at present, but we understand the company will resume work at an early day.

THE Connelly continues to pan out well, and makes a daily shipment of about 15 tons of ore. .

WORK has again been resumed on the Bradford property.

ESMERALDA DISTRICT.

EXCELSIOR.—Esmeralda *Herald*, May 1: For the past two months the *Herald* has been doing all that it possibly could to help the few energetic men of Esmeralda district in wakening up the people to a sense of the richness that lay idle here only waiting for a little display of energy and of capitel to come forth. The fruits of these united labors are commencing to ripen, and before many months will be ready to harvest. Work has already begun on the Grand Trunk, and we now have it from the best authority that on Monday or Tuesday at the farthest a force of men will be put to work on the Excelsior mine, Silver Hill. This is indeed encouraging, and will no doubt be the cause of other mines being worked in this district.

REAL DEL MONTE.—The work still goes on as usual. Two drifts are being run on the 500 level. and fair progress made in both drifts. Superintendent Tyrrell is anxiously awaiting the arrival of timbers to commence sinking in the main shaft, which work will start immediately on the arrival of said timbers.

COMMENCED WORK.—Yesterday the necessary papers were signed and a contract let to run a 200-ft tunnel on the ledge of the Grand Trunk mine. Two shifts were to be put to work, according to the specifications of the contract, and the tunnel pushed forward with all possible speed. This morning the men getting the contract went to work.

I X L DISTRICT.

THE CAMP.—Cor. *Mining News*, April 30: The camp will, at no distant day, be booming. The first thing that attracts the eye of the stranger on his arrival at Roseville is the croppings of the Bayfield mine, which is located directly behind the town, to the north. This mine is owned by Eureka men, and is being worked with energy. They are at present sinking two shafts, both of which are in good ore. At the upper shaft they have over 200 tons of high grade ore piled up ready for reduction. Adjoining the Bayfield on the east is the East Star mine, owned by James Allen & Co., and is being worked under the supervision of Mr. P. Maloney, and although their shaft is not 50 ft deep, it is all in very fine ore, going largely in gold. The I X L and Black Prince mines are a perfect mountain of carbonate and galena ore. I have never seen anything to even approach its gigantic proportion. The whole heart of the mountain seems to be literally one mass of ore extending for a distance of 600 ft. On the 5th of the present month Judge Harlan and W. H. Howard, of Paradise, purchased 10,000 tons of ore from the I X L mine, and intend to begin the reduction of the same as soon as arrangements are completed. The same gentlemen are trying hard to make the amount 30,000 instead of 10,000. Altogether the outlook for the camp is exceedingly bright, and when the boom comes some old timers on the Hill and in Eureka, who are holding claims, may suddenly find themselves rich.

SILVERADO DISTRICT.

QUEEN MINE.—Eureka *Sentinel*: The winze at the bottom of the 168-ft shaft is now sunk to a depth of 58 ft, all the way in good pay ore. This has been one of the best paying little mines in the district, and if in the hands of a good company would soon be not only self-supporting, but would pay its regular dividends. During the past 5 years the Jones Brothers have taken out over $125,000 while prospecting the mine. They have erected steam hoisting works, built water tanks of a capacity of 10,000 gallons, built good roads to the mine, besides making many substantial improvements at a cost of not less than $20,000.

ARIZONA.

ARIVACA DISTRICT.—Tucson *Record*, April 28: In the Arivaca district much work is being done, although the section suffers considerably from the threatening rumors regarding what is termed the Poston grant, which has certainly retarded its prosperity and has already prevented the sale of several meritorious properties. The Arivaca mill is at present running but 10 of the 20 stamps, these crushing ore from a Sonora mine. The ore is put through the batteries dry, then roasted and treated by J. O. Stewart, and finally amalgamated in the mill. The results have so far been very satisfactory, when it is considered that the ore is most rebellious in nature. Not more than from 8 to 10 tons is put through in 12 hours at present, owing to the lack of roasting capacity. The main shaft on the Con. Arizona is down 103 ft, but has, at present, some 60 ft of water, which will prevent further development until the machinery, including a 16-horse power pump, is erected. The Grant gold mine is supposed to be an extension of the ledge above mentioned, and is, to all appearances, among the best gold prospects in the Territory.

COLORADO.

WAR EAGLE.—Central City *Register-Call*, May 7: Assays of ore from this lode have been made which show $1,736.18, silver, per ton. The vein is situated south of the Clifford mine, on Clifford mountain.

BRICK POMEROY.—Georgetown *Courier*, May 6: The lode is opened by an adit 125 ft long, and a shaft has been sunk from its breast to a depth of 60 ft, from the bottom of which a level has been driven 40 ft both east and west. The level, half way down the shaft, has been run east about 20 ft, and some of the ground over it has been stoped. The back of the stope shows a vein of ore from 1 to 2 inches thick that is worth about 400 ounces.

PERU DISTRICT.—The adit on the Whale lode is being pushed ahead by night and day shifts. It is now in 65 ft, and shows a vein of solid galena ore, 5 ft thick, that mills 25 ounces in silver and 60% lead. A new vein of ore has been struck in the Peruvian that sample assays 86 ounces in silver. The ore mills high in lead, and the vein ranges from 6 inches to 8 ft in thickness. The Susquehanna has a vein of galena 30 inches in thickness that assays 86 ounces.

SUNDOWN.—Silver Cliff *Prospect*, May 5: Is producing a gray copper ore that runs as high as 232 ounces in silver and 30% in copper. The company is enlarging the shaft, preparatory to timbering.

LONDON.—Fairplay *Flume*, May 6: There is a large quantity of good ore in sight. Mr. Kuenig, manager of the Golden smelting works, a few days ago contracted for the ore as soon as it can be shipped down.

DAKOTA.

BLACKTAIL.—*Black Hills Times*, April 28: Savage & Noyes are at work on Blacktail with every available man, getting their water ditch ready for hydraulicing at once. The last storm has been a god-send to them. They have a water ditch ½ mile long, which will carry 200 inches of water, and gives them a pressure of over 100 ft. The snow was 6 or 8 ft deep in this ditch yesterday morning, and this all had to be shoveled out. They own 6 of the best placer claims on Blacktail, and have all the ground they can work in the next 10 years. They worked only about 3 weeks last season, but during that time took out big pay. Allen & Carlan, in Deadwood gulch, were busy yesterday with their bedrock flume, the melting snow giving them all the water they could profitably handle. From present appearances they will now make a good season's run.

BALD MOUNTAIN.—W. H. Bull & Co., the owners of the Silver Plume mine at Bald mountain, have concluded arrangements to put a force of men at work. This mine is looking first-class; a tunnel has been run in something over 100 ft, and is showing up good ore at the end. There is but little doubt that the Silver Plume will develop into a mine equally as good as the Suowstorm, and at a very early day. The Trojan mine, higher up on the mountain, is supposed to be on the main ledge of that belt, and shows up richer ore and more of it than any of the mines up there. It is simply a matter of time and there will be mills up there on all of these mines.

IN CENTRAL CITY every mill, excepting the Calcdonia 20-stamp mill, have hung up their stamps; no ore and so much snow that none can be hauled for a day or two.

THE Golden Star No. 2, at Lead, is continuing to improve in appearance as the shaft goes down. It will be remembered that a body of water was struck in this shaft the other day which arose 60 ft. The pumps that were put in soon relieved the shaft of water, and now there is no serious trouble on the water question. The shaft is now all the way in ore, and looking better as they go down. This mine belongs to the Homestake company, and is south of the Homestake mine running towards Pennington.

IDAHO.

YANKEE FORK.—*Herald*, April 24: Messrs. Brown, Schaub and Stein, of the Jordan Creek placer mining company, reached bedrock in their drain a few days ago, at a depth of 24 ft. The drain was started last spring by Eureka parties, but it was thrown up. The present company commenced work in November, and in spite of the severe winter kept the work going. The drain is now about 1,600 ft long, commencing with an open cut of 550 ft in the flat above Chinatown, and the remainder, 1,050 ft, is under cover and well timbered. The drain follows up the bottom on the west side of Yankee Fork, and will not only drain the Jordan placers, but Yankee Fork, which is believed to be very rich in gold. The face of the drain is dry and consequently good drifting. An upraise will be started at once to connect with the surface. The prospects are very flattering, and in a short time the center of the bed of Jordan creek will be reached, where the pay channel without doubt is located. Ray & Co., drifting at the upper end of the Jordan Co.'s ground, are finding many large nuggets and taking out much pay dirt to wash this spring.

THE OUTSIDE CAMPS.—George Parody returned Monday, accompanied by John Foster, from Idaho City, and gives us some interesting items. There is considerable excitement at Shew's Mountain over recent developments, and the Plowmen 10-stamp mill has been moved from Idaho City to that place. There are 4 ft of snow at Idaho City, but all have confidence of a revivel of mining affairs as soon as the snow goes off. The contractors on the Banner mine, at Banner, are opening out that property in good shape, preparetory to taking out ore this spring. R. A. Lake, Pete Albert, Nels Weaver, and twelve or fourteen others, are in Stanley Basin working their placer claims. From the prospects obtained the boys will all have a good run this spring. Several parties who came into Stanley Basin lately had quite a severe trip, having been out several days on very short rations.

STILL THEY COME.—Birch Steele, the original discover and locator of the 79 and 80 claims on Mount Custer, has struck a 3-ft vein in the 79 of very high-grade ore. The cut running in on the vein is about 45 ft in length, and the shaft from this level is down 10 ft on the ore body. The claim is situated a short distance from and northeast of the Custer. The 80 is an extension of the 79 on the west.

STRUCK IT.—*Idaho World*, May 6: Mr. James Irwin commenced work on a tunnel last fall to tap the Panamint, which is situated three or four hundred yards above the Banner quartz mill. He struck it last Friday at a depth of 70 or 80 ft. The tunnel is in 110 ft. The vein is 2 ft wide, and is immensely rich in silver from wall to wall. Mr. Charley Magee brought to town last Monday some fine specimens from this mine—the richest we have ever seen from the Banner district. A piece taken from the poorest streak in the vein is good average rock. The lucky owners of the Panamint are Messrs. James Irwin & Ben. Miller, two energetic miners, and we are glad they have struck a bonanza. Mr. Irwin has spent most of his time since 1867 prospecting in Banner district, and his recent discoveries promises to richly reward him for his labors.

GOLD HILL.—Boise City *Statesman*, May 8: Mr. Jacob Motto, of Quartzburg, informs us that the perpendicular shaft in the Gold Hill mine is now down 400 ft. From the bottom of the shaft a narrow single drift has been run for a short distance, which strikes the ledge in good ore. The company has about 70 men employed in the mine and mill, and are crushing an average of 45 tons per day.

MONTANA.

ROCHESTER DIGGINGS.—Oloudnle *Atlantis*, May 5: Henry Harlow and Daniel Moynihan went in last November, prospected in a number of places and finally sunk on what is called the Moynihan ledge, now down 20 ft. They came to Oleudale Friday, after scantling to put a track in the incline. The vein pitches at an angle of 45°. It is 2 ft wide, in lime and decomposed granite. One rich streak in it is 3 inches wide, and from this they pounded out 11 ounces and 3 pennyweights of gold from 50 pounds of rock in a hand mortar; this they sent to the mint. They have considerable ore on the dump. Right beside the rich seam is a ledge of talc. The foot and hanging walls are good. This claim is 2 miles above the old town, which in 1868-60 numbered 600 inhabitants, engaged in placer mining; large quantities of gold were taken out and Rochester was a lively camp. Good west coast prospectors might do well to prospect in that locality. A good, enterprising man with a quartz mill could make money there. A great many other ledges have been located in the neighborhood and are being developed. They assay away up.

THE SMELTER.—When the Smelter closed down the other week for want of charcoal, general manager Atkins had the syphon, between the furnace and the outside well, raised—that is, the water-jacket was cut out so that the bullion could flow out at the new or enlarged orifice 1 ft higher than before. This greatly facilitates the discharge. Previously it was necessary to keep the furnace sufficiently hot to form an alloy of the copper matte and speiss with bullion that was fed in for this purpose, thus forcing the lighter metals below the heavier ones; otherwise a crust would gradually form and eventually there would be a "freeze-up." With the amount of lead carried in Hecla ores, some bullion had to be fed in about every 20th charge; now there is no bullion fed and the speiss and matte are drawn off without trouble or danger. Every pulsation of the blast pipe may be seen on the bullion in the top of the syphon. The slag flows out without obstruction. If there was more lead in the ores, the flux would be nearer perfect, but the simple contrivance referred to remedies this drawback. The furnaces are now operating like a charm, and the yield of bullion is very large.

OREGON.

MINING ITEMS.—*Oregonian*, May 1: William Griffin has discovered a promising quartz ledge on Shann creek, in Josephine county, the rock from which looks well. The Grave Creek ditch company has resumed possession of its diggings and employed a number of hands to prospect them thoroughly. The miners of Josephine county are busy, have plenty of water and expect to do well this season, which will no doubt be a protracted one. A gold nugget was taken from the claim of Smyer & Co., at Susanville, Grant county, recently, weighing $260. A $50.25-nugget was also taken from Sam Hillis' claim at Marysville. Gin Lin, the Chinese mining shark, made a clean-up at his diggings near Uniontown this week, from which he obtained about $2,400 in gold dust. This is the result of only a short run, and is evidence that he has some of the best diggings in southern Oregon.

UTAH.

BINGHAM ITEMS.—Salt Lake *Tribune*, May 6: Capts. Davis and Boundy are making preparations to jig their ore. Harry Dunston is working a lease on the Utah; the ore taken out will be concentrated. The snow is rapidly disappearing, and will afford good opportunity for prospecting. The gold belt is looking A No. 1, and the coming summer will astonish the outside world. The Jordan has a large body of gold quartz in sight, and is turning out some fine bullion. Jones & Beemis are working the Bonny Blue Flag on second-class ore for concentration. E. Rawdin & Co. are about starting up concentration works on the Moscow and other dumps. Sam. Eeds has got his concentration works in running order, and intends starting up on the Utah dumps at once. Goodloe is taking out some fine grade ore on the upper works of the Moscow. Dowmott & Hickman are working the west side of the Spanish, taking out considerable ore; all of their second-class ore is being put through the jig. John Cornwall is doing considerable prospecting on the Silver Crown. Ore has been struck that runs from 40 to 75 ounces silver, and an average of 30% lead.

AMERICAN FORK.—The Silver Bell is working five men, Excelsior company eight and the Miller three men. Capps is working the Orphan on Mineral flat. The Dutchman is working four men, and is taking out ore. The Sunday tunnel is being pushed ahead with three shifts. The Queen of the West company are working five men on the Kussler. The Pittsburg mine is said to be under negotiations to the Old Telegraph company at Bingham. The snow in the district is from 8 to 10 ft deep, and developments have been somewhat retarded this winter. The prospects for a good season, however, are very flattering.

BIG COTTONWOOD.—The Colbath tunnel this month has cut a small vein of mineral and ore feeders. The Oregon main shaft is going down as rapidly as full shifts of men can push it, and improves in appearance. The Butte, Prince of Wales, Grizzly, Highland, Evergreen, City of Rocks and other mines all have ore awaiting shipment as soon as the trails are opened. The Cerioca shaft is in a strong vein of iron oxides, lead and silver. Full shifts of men are at work on this property, and the force will be increased as soon as the weather permits.

Bullion Shipments.

Since our last issue, we have noticed the following bullion shipments:

Grand Prize, May 7th, $23,388; Paradise Valley, May 7th, $3,182; Ivanpah, May 12th, $6,110.80. Stormont S. M. Co., Utah, shipped in January, $48,088.72; in February, $35,346.18; in March, $38,375.67; and in April, $38,105.55. First four months of the year there was shipped from Tuscarora district, $146,644.

Notes on Pacific Coast Fish and Fisheries.

[By W. N. Lockington.]

Gadus macrocephalus—Prohahly the cod of the Alaska cod-fishery is this species. It has a very long barhel and a very large head, with the upper jaw overhanging the lower. The fin-rays ars: D. 14—14—17; A. 19—19. The flanks are spotted.

Gadus auratus, Cope—Has also the upper jaw overhanging the lower, the heard as long as the diametsr of the sye, and the head 3.6 timcs in the total length; hut the dorsal rays are 13, 16, 16, the anal 19, 16, and the color brown upon the sides and ahove, golden yellow upon the lower surfaces and upper jaw. There is also a median angular yellow band upon the first dorsal.

The catch of eodfish in 1879 was rather larger than that of 1878, amounting to ahout 2,000 tons. The trawls used in the Alaska cod-fishery are often 600 fathoms long, and hear on each side a row of hooks at every half-fathom or thereahouts. After they are paid out, they are examined at intervals, and are drawn once or twice a day, according to the rate at which the fish take the bait.

Hippoglossus vulgaris—There is little doubt that the large *Hippoglossus* of this coast, which has three rows of teeth in front of each jaw, is the same as the Atlantic species.

Many Arctic marine animals occur both upon the Atlantic and Pacific coast, as for example, the walrus, the mysticetus and several crustacea, among them *Idotea entomon*. But this species extends southward heyond the Arctic region far into the temperate zone. It is ahundant in Puget sound and as far south as Cape Mendocino, in 40° north latitude, or on ahout the parallel of Naples and Constantinople. Sonth of this point it hecomes scarcer, hut stragglers occasionally occur as far south as the Farallones. It is essentially a deep-water fish, and does not enter land-locked bays like those of Humboldt and Tomales. The only species of flat-fish with which this fish is liable to he confounded is the large flounder known here as the Monterey or Bastard halibut. Large specimens of the latter species equal in size an ordinary *H. vulgaris*, and the form of the hody, and semi-circular arch of the lateral line, are similar. But in the Monterey halibut (*Paralichthys maculosus*, Gir.) the teeth are fewer, and in a single row in hoth jaws; and the coloration, instead of heing invariahly upon the right side, as in the halihut, is rather more frequently upon the left side than on the right.

Individuals taken on this coast rival in size those of the Atlantic. Although the average size varies from 70 to 100 pounds, several brought to this city have weighed from 150 to 180 pounds. One example measured seven feet one inch in length, and weighed 190 pounds after the inside had heen taken out. Another, similarly prepared for market, weighed 220 pounds.

During 1879 two loads, packed in ice, were hrought from Puget sound to San Francisco in a vessel fitted up for the purpose; the trip occupied four days, and the fish arrived in perfectly good condition, hut so large a supply suddenly thrown upon the local market reduced the price to an almost, if not quite, unprofitable rate.

The only previous attempt to hring this fish to the San Francisco market in large quantities was made ahout 20 years ago, when a load of from 20 to 25 tons was hrought in ice from Puget sound. These were "the days of old, the days of gold," when every Californian expected to make a fortune in six months at most. So that when the Captain found he could not ohtain the price he reckoned upon, without further ceremony he pitched the whole cargo into the hay.

When the large size and abundant supply of this important food-fish is considered, it is a matter of wonder that the quantity smoked or canned for the market is so small as it is. The business of preparing smoked halibut is still in its infancy. Halibut is canned hy the North Pacific Canning Company, Klawack, Prince of Wales island, and is of very good quality, hut has not at present met with the favor it merits.

Although a weight of 200 pounds, or thereahouts, is large even for a halihut, Yarrell (British Fishes) states that individuals of 500 pounds weight are occasionally taken in the northern European seas, and one weighing 600 pounds is on record as having been taken on the coast of Maine.

Glyptocephalus pacificus and G. zachirus—The reason that these two species escaped description until I first noticed them in the spring of 1879, is prohahly to be found in the fact that they are hrought from Point Reyes, at which point there was no fishery until ahout three years ago. The latter species—which I believe to he superior in flavor to any other of our flat fishes—was not common at any season, disappeared from the markets ahout August, and is now (March) again making its appsarance. The former species hecame tolerahly abundant at the time of the disappearance of *G. zachirus*, hnt has not occurred, except in isolated individuals, between September and March.

It is probahle that both these species resort to deeper water in the winter season.

The dealers have no special names for these two species, which may be characterized, respectively, as the Short-finned Narrow Flounder and the Long-finned Narrow Flounder.

Zaniolepis latipinnis, Gir.—This is hy no means a common species in ths markets, where it occurs only, so far as I have ohserved, at midsummer. Its yellowish-greeu tint, maculated fins, and extraordinary long second dorsal spine, give it a very peculiar appearance. The length of the second spine varies in different individuals, hut its tip usually reaches, when laid hackwards, the twenty-first or last spine of the dorsal fin.

The only parts of the scales visihle externally are the spinules on their posterior edges, so that the surface of the hody seems covered with prickles, which are felt only when the hand is moved from tail towards hsad, and give the skin a velvety appearance.

The sides of the hody, in a fresh specimen, present two series of orange spots, ranged opposite the spaces hetween the dorsal rays; the upper of these rows is coincident with the lateral line anteriorly, hut above it posteriorly. On the first dorsal are three rows of orange spots, the lower row circular, and placed centrally between the spines—the upper row ohlong, and lying along the hinder side of each spine, the middle row intermediate in character as well as position. On the soft dorsal there are also three rows of orange spots, the middle alternating with the lower.

The anal is hlackish, darkest near the tip of the rays, the free tips of which are white, and the ventrals are similarly colored; but the pectorals are harred and spotted with orange, and the caudal clouded with black and yellow. The head has indistinct orange blotches, and the iris is light golden.

Among some fishes helonging to the State University are about 20 specimeus of a hitherto undescribed species of *Agonoid*, noticeable for its comparatively large size, the curious armature of striated scutes upon its hreast, and the great development of the spines upon the scutes of the hody. Though rather large for the family to which it belongs, it is only about six inches long.

Another character, which, though common to many fishes, distinguishes it at once from its nearest allies, is the projection of the lower jaw beyond the upper. In most of the species the upper jaw projects greatly.

The Agonidæ have their body protected with rows of scutes instead of scales, and the posterior angles of these scutes are often, as in this species, produced into a spine. In this form the scutes of the anterior part of the hody do not coalesce, and the spaces hetween them are filled with an array of small prickles. Parts of the head are set with similar prickles. The head is mnch less spinose than in many of its relations. This interesting form was procured in Drake's hay, at a depth of 10 fathoms by Mr. Voy. A single specimen of the species occurred in the market March 1st aud was promptly secured by Prof. Jordan.

Torpedo californica, Ayres—The museum of the California Academy of Sciences contains only a single small specimen of this species, prohahly the one which formed the type of Ayres' original description. It was therefore with some interest that I lately ohserved in Clay Street market a large example of this species, taken in Tomales hay. I suhjoin a few dimensions:

	Feet.	Inches.
Total length	3	½
Greatest width across pectoral fins, when first measured	2	
Greatest width across pectoral fins, about 24 hours later	2	2½
Width across ventrals	1	1
Longitudinal diameter of eye		½
From front of disk to center of mouth, when closed		2⅜
From front of disk to angle of mouth, when closed		3½
From front of disk to first dorsal	1	11⅜
From front of disk to second dorsal	2	3½
From front of disk to vent	1	9½
Interocular width		3
Width of mouth		3½
Distance hetween the spiracles		2½
Width across caudal fin		8½
Length of hase of first dorsal		2⅜
Hight of first dorsal		4
Length of hasc of second dorsal		1½
Hight of second dorsal		2
Front of disk to eye		2 13-16
Front of disk to anterior edge of spiracles		4
Length of spiracle		1

I am assured by the dealers that this fish attains still larger dimensions, and Mr. Emerick, of this city, tells me that he has seen larger on more northern parts of the coast. The teeth are very small, so that the creature evidently trusts to its electric powers for defense.

Orcynus pacificus, Cooper—This species, the Alalonga or Albicore of the sailors, has occasionally been hrought to market in October and Novemher, at which season it is tolerahly common in Monterey hay.

Clupea mirabilis, Gird—In Novemher and Decemher the herring season is at its hight, constituting prohably the half of the total amount of fish hronght to market. Large quautities are taken in the bay.

Besides the supply of fish taken hy vessels belonging to San Francisco in the hay, and at various points north and south, ranging seaward as far as the Farallones (a group of small, rocky islets about 30 miles from the Golden Gate), a large quantity is sent hy rail from Tomales hay on the north and Monterey hay on the south.

Among the species hrought from the latter locality are several, which either do not occur, or are very rare in Tomales bay. Among these are all the Scomheroids of this part of the coast, namely, *Orcynus pacificus; Sarda chilensis*, the Bonito; *Chriomitra concolor, Scomber colias*, the Spanish mackerel; *Poronotus simillimus*, the Pompino, and *Trachurus symmetricus*, the Horse mackerel; *Sphyræna argentea*, the Barracuda, and *Alosa sapidissima*, the shad.

Ths Scombridæ ahove mentioned, with one exception, are only hrought to market in the autumn (September, Octoher, November). The one exception is the Pompino, of which a limited supply is kept up during the greater part of the year.

Custom Ores.

There came to Eureka a few days ago Mr. I. S. Backus, a capitalist of New York, and Mr. J. T. Gos, a well known smelter and mining man of Utah. Mr. Backus represents a large amount of capital in the East, he, with others, having made a pool of several hundred thousand dollars to put into legitimate mining in the West. Mr. Backus was sent out on behalf of the pool to purchase properties. Coming to Utah, he induced Mr. Goe to join him in the search for something desirable. Mr. Goe is a first-class miner and expert, and it was for this reason that Mr. Backus desired his company. The two traveled all over Utah Territory, hut could find nothiug that suited them. They next went to South Mountain, Silver City, Boise Basin and other points in Idaho with a similar result. They came to the Central Pacific railroad at Winnemucca and had started eastward. Picking up a copy of the *Sentinel* at some place aloog the road containing glowing accounts of the mines and resources of Eureka district, they concluded to switch off at Palisade and take a look for themselves. To say that they were hoth surprised and gratified with the extent and outlook of the mineral resources of Eureka district hardly expresses the favorable opinion formed of this section. Mr. Goe declared that it was the greatest mining camp in the world, and gave it as his opinion that within two years from this date Eureka will he the largest and most permanent mining center on the American continent. He thinks there is a magnificent opening here for custom smelting works and samplers, and these he expressed a determination to provide the present season. Mr. Goe has gone hack to Utah with a view of settling up his business there, intending to bring his family and take up his resideuce in our midst at once. Mr. Goe will he heartily welcomed to Eureka. Enterprisiug mining men, who can command capital, is the great want of the district. The more we get the better. Mr. Backus also determined to make Eureka the scene of extensive mining operations. Having been more than pleased with the general situation, both gentlemen thought it would be as well to return to Salt Lake and await the disappearance of the snow from Prospect mountain. They will put in an appearance here again in about three weeks, when they will mean business. The *Sentinel* guarantees that they will he able to find any number of desirable propertics.—*Eureka Sentinel.*

The Bonanza Mine.

Less than three years ago, McGee, McFarlane & Co., moneyed men residing at Howland Flat, made a loan of $3,000 and took a mine located in the viciuity as security. Time rolled on, the horrowers failed to meet their ohligation, and the capitalists were compelled to get their money out of the mine or do witbout. Repeated efforts to sell the property for 50% helow cost failed, and as a dernier resort the gentlemen decided to develop the claim and make the best of a bad bargain. Work was resumed on a tunnel in the fall of 1878, but the lahor of several months caused the operators to believe that they were wasting money and ceased that task. Meanwhile, the Empire company's property, which adjoined the "Bonanza," had heen worked out and yielded $520,000 net profit from working 400 feet of ground. This faet gave the discouraged gentlemen new hope. They purchased the deserted Empire tunnel and resumed work in making a cross-cut from the end of it into the "Bonanza" ground. Last week, after having expended considerable money in carrying out their plan, and kept a force of men constantly at work for over a year, the "Bonanza" lead of gravel was struck. The first candle-box of dirt taken out cleaned up $182. Five hours work on the dirt taken from the mine, which is worked hy the drift process, resulted in a shipment of $17,000. Late advices from the mine state that the lead grows richer and that the operators are convinced that they have a veritable honanza. They have 2,500 feet of ground to work on, and experienced miners assert that it is if anything far richer than the old Empire was. The affair has created considerahle excitement at Potosi (two miles above Howland Flat) where the mine is situated, prospectors heing actively engaged in locating claims upon every unclaimed foot of land on the ridge. Having regarded their mine as comparatively worthless up to the time that the Empire payed so well, the proprietors of the "Bonanza" are thoroughly and very agreeably surprised.—*Oroville Mercury.*

Mill Music.—The uew quartz mill recently put up hy M. G. Griffith and O. P. Hart, on the Montezuma claim, near Nashville, was started up last week and has ever since been hammering away at a livcly rate on rich ore from that monster ledge. It is a good many years since the Nashvillians have heard that kind of mnsic, and it has infused new spirits into the camp. We predict that it will not he long until the number of stamps now at work will he many times multiplied, and Nashville will he a flourishing mining center.

New Mines at Deep Spring Valley.

The location of rich silver and gold-besring quartz in the region of Deep Spring valley and vicinity, have recently attractsd the attention of not only mining men, but of San Francisco parties who are rspresented on ths ground by their agents and experts. Mr. W. A. Skidmore has just returned from a visit to the nsw district, and from him the Inyo *Independent* gleans the following particulars:

Desp Spring valley is situated in the northern portion of Inyo county, at a point where ths White mountains and Inyo ranges blend, or more accurately speaking, where they lap the valley, which is 6,150 feet above sea level, forming ths dividing basin between the two ranges. Ths valley is about 10 miles long by 5 miles in width, and is surrounded hy mountains having an average hight of 10,000 feet above sea level, over which easy passes and a good wagon road connect it with Owens River valley on the west and Fish Lake valley on the north. The nearest postoffice town is Big Pine, on Owens river, distant 25 miles. The surrounding mountains are ribbed with ledges of quartz carrying average rock varying from $50 to $100 per ton, of which the proportion in gold in value is from one-tenth to one-fifth. Wood for fuel is found in abundance below the snow line, and can be delivered at suitable mill sites for $6 to $7 per cord. Water flows in profusion from springs and creeks on the mountain benches, affordiug mill sites on all sides of the valley. The mineral wealth of this region was known to the pioneer prospectors of the country, hut its developmeut was retarded hy the hostility of the Indians, who found safety in the rugged character of the conntry and its distance from the settlements of the Owens River valley. The early discoveries were confined to the range hordering the northwest side of Deep Spring valley; but the recent discoveries lie on the range flanking the southeast side, and dividing Deep Spring from Eureka valley—the principal loeations being on the slope overlooking Eureka valley, near Soldier pass, a deep cleft in the range connecting the two valleys. This range is composed of micaceous granite flanked ou the Eureka valley side hy porphyritic slate. The principal ledges, known as the Whiteman, Horton, Thanksgiving, Eastern, Western, Southern, Broder and Hedge occur on the line of contact with these formations. The granite hanging country and porphyry foot eountry are sometimes widely divergent—50 to 300 feet—and the intervening space is filled with soft decomposed material in which occur the veins of the district, sometimes on both walls, and again, as in the Whiteman, Horton and Eastern, massive and compact. The ledges, where exposed, are from three to five feet in width coursing northeast and southwest with the general trend of the range and dipping westerly under the granite at a supposed angle of 45°. The characteristic features of the district are the great length of surface exposure of the ledges aud the uniform mineral-hearing character of the quartz. Thns, the series above named may be traced hy outcrop ncarly 10,000 feet with only slight spaces of capping, and where the ledges are exposed showing chimneys 200 to 400 feet in length of high-grade ore. The actnal width of the ledges has not heen determined further than hy the snrface stripping of three to five feet in width. The average of seven assays of high-grade ore from the Whiteman at a depth of three fest gave $251 per ton. The whole body of ore exposed hy stripping a length of 33 feet will give a similar average of $100 per ton. The ores are of the character known as stephanite, and are tractahle to the ordinary mill and pan process without roasting. We understand from Mr. Skidmore that interests in these mines now vest in San Francisco and Sacramento parties, who propose during the coming season active operations in prospecting the new locations.

The Mining Outlook.—There is ahundant evidence on every hand of great, and we believe, profitahle activity. There are at least two score of mines, organized here, nearly ready to announce dividends. We could name nearly one hundred companies who have their new works, smelters and mills, nearly ready to fire up the furnaces or drop their stamps. The snows are melting and the roads will soon he fit for traffic and travel. An abundance of water will soon make the miners' season a busy one. Prospecting is heing organized in a hndred different directions. Nor is this important factor being left any longer to the courageous and energetic, hut often ill-directed efforts of individual and generally ill-equipped prospectors. It is being prepared for hy capital, directed hy knowledge, and to he led hy energy and skill. The carbonate camp is hut a "flyer" hy the side of the enormous activity to he felt in all directions. There are immense quantities of ore awaiting shipment. Railroads are heing constructed or surveyed in many regions. The Gnnnison country is not to secure all the hoom. Utah, New Mexico, Montana and Arizona, southern and western Nevada, and California also, are beginning to feel the impetus the discoveries at Lsadville and the returns already obtained have given to mining in every locality.—*New York Mail.*

The Oregon iron works, Portland, which have been closed for over a ycar, and have hsen in the hands of an assignee, have heen sold, in satisfaction of the mortgage held hy the First National Bank. Smith Bros. & Watson were the purchasers, and the price paid was $15,025.

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions* rendered upon patent cases in litigation, for the benefit of our readers:

DECISIONS OF THE U. S. COURTS.

The Atlantic Giant Powder Co. vs. the Dittmar Powder Co. et al.

U. S. Circuit Court, Southern District of New York.—Decided Mar. 13, 1880; Blatchford, J.:

1. Reissued Patent No. 5,709, granted to the Giant Powder Co. Mar. 17, 1874, sustained, and held to be infringed by the use of a compound containing nitro-glycerine, 07.64 parts; cellulose (paper stock), 16.82 parts; and saltpeter (nitrate of soda), 15.54 parts; and of a compound containing nitro-glycerine, 27.86 parts; saw-dust and charcoal (in nearly equal proportions), 5.59 parts; and saltpeter (nitrate of soda), 66.55 parts.

2. Nothing appearing from the additional evidence introduced to warrant a different finding, the decision in the case of the Atlantic Giant Powder Co. vs. Rand *et al.*, declaring reissued patent No. 5,709 to be for the same invention as original patent No. 78,317 to Julius Bandmann, assignee, to Alfred Noble, May 26, 1868, reiterated.

3. There is nothing in the evidence to show that Noble derived from Dittmar knowledge of the invention described in reissued patent No. 5,709 or in patent No. 78,317, or that Dittmar made any invention that is described in his patent of Jan. 18, 1870, before Noble made the invention contained in reissue No. 5,709.

4. The conduct of the plaintiff and its proceedings heretofore with respect to its litigations and to Dittmar, do not appear to have been such as would deprive the plaintiff of the right to a preliminary injunction against Dittmar and the Dittmar Powder Manufacturing Co., and the same is granted.

There must be a preliminary injunction against Dittmar and the Dittmar Powder Manufacturing Co. as to powders like the samples. The plaintiff does not make out a case for an injunction against any of the other defendants. It does not offer any proof as to any articles made according to the Dittmar patent, and, therefore, it is unnecessary to refer to that patent, and none of the defendants but Dittmar and the company are shown to have been connected with the said samples.

Kirby Bung Mfg. Co. vs. White et al.

U. S. Circuit Court, Eastern District of Missouri.—Decided March term, A. D. 1880; Treat, J.; McCrary, C. J., sitting:

1. An injunction should never be allowed to operate oppressively upon anyone, but be used for the purpose of securing the rights of the complainant in the case pending the litigation without unnecessarily injuring the other party.

2. Under the State laws of Missouri there is but one form of a restraining order. If an injunction is asked for provisionally, it must issue as an injunction *simpliciter*.

3. In the United States circuit courts, restraining orders vary according to the circumstances of the case. Thus, in some cases, patent as well as others, there may be such circumstances as require an injunction *simpliciter*; but ordinarily a bond and order for accounting suffices, and sometimes simply an order for an accounting.

4. For the purposes of a provisional injunction under the patent law, infringement having been proved, two things, or either of two things may exist, to wit, a final decree sustaining and upholding the validity of the patent after full consideration of the matter or proof that the patent went into use undisputed for a sufficient time to raise a *prima facie* case in the complainant's favor.

5. A mere decree entered *pro forma* on the merits is not sufficient of itself to require other United States circuit courts to grant a provisional injunction.

6. On motion for a preliminary injunction, the complainant should set out and describe what the defendant is doing or using that constitutes the infringement charged, in order that the court may determine whether there is such infringement as to warrant the granting of the motion. A general affidavit amounting to no more than a verification of the original bill, will not serve this purpose, being but the opinion of the complainant that the defendant infringes, a fact of which the court should be the judge.

The motion for a provisional injunction is denied.

Christman et al. vs. Rumsey et al.

U. S. Circuit Court, Northern District of New York.—Decided Sept. 10, 1879; Blatchford, J.:

1. Reissue No. 5,804, granted to John Christman, Mar. 24, 1874, for an "improvement in pump-filters," does not contain new matter, and as to the first claim is valid.

2. The decisions of the Commissioner of Patents in granting a reissue that, by reason of an insufficient or defective specification, the original patent is inoperative or invalid, and that such error arose from inadvertance, accident or mistake, and without any fraudulent or deceptive intention, conclusively establishes the fact.

3. When the specification and drawings of the original and reissued patents illustrate and describe the same mechanical structure, with the same mode of operation, the reissue may lawfully contain claims for combinations of fewer elements than were contained in the combination claimed in the original patent.

4. The original patent claimed the entire combination, and the reissue sub-combinations which enter into such general and larger combination: *Held*, that the reissue was for things contained within the apparatus described in the original patent, on the authority of Brown vs. Guild (23 Wall., 18), and Herring vs. Nelson (14 Blatch., 293) as against Gills vs. Wells (22 Wall., 1) and Russell vs. Dodge (3 Otto, 460).

5. Although the second claim of the patent is invalid for want of novelty, the plaintiffs can recover on the first claim, although no disclaimer has been made to the second claim, provided that prior to the entry of a decree as to the first claim a disclaimer is entered as to the second claim that not appearing to have been unreasonable neglect or delay; but he will not be entitled to costs.

This suit is brought on reissued letters patent granted to John Christman Mar. 24, 1874, for an "improvement in pump-filters."

A decree entered for an account of profits and damages and for a perpetual injunction as to the first claim.

Dittmar vs. Rix et al.

U. S. Circuit Court, Southern District of New York.—Decided Mar. 13, 1880; Blatchford, J.:

The use of a process which omits one of the essential parts of that patented, and does not employ a chemical equivalent in its place, is not an infringement.

* More complete reports of the proceedings may be found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street, S. F.

PRETTY RICH.—Two of our big gravel mine owners, whom we will call McG—— and P——, were recently bragging of the richness of their respective mines. P—— finally put the clincher thus: "I walked around in these slums," pointing to the liquid mud lying on the bed rock, "for a while the other day, and then walked home half a mile. Before going in the house I stamped most of the mud off my boots. I then washed off what still stuck on and panned it out, finding forty or fifty colors." McG—— was silent.

LOCOMOTIVES run by compressed air have been tested in the Sutro tunnel, and it is believed will prove the most proper kind to use.

HYDRAULIC miners in Nevada county say that the present season will be one of the most profitable they have had for years.

Useful Information.

WOODWORK BURNED BY STEAM.—The *American Manufacturer* says: "At the Crescent Steel Works, in this city, a steam pipe 2½ inches in diameter, carrying from 90 to 100 pounds pressure, was laid under ground about three years ago, encased in common pine boards about one inch thick. A few days since occasion was had to dig up the pipe, and the whole length of the wooden drain was found to be charred and apparently burnt about three-fourths of the thickness of the wood, the other portion being partially rotted. The whole inside of the drain was turned to charcoal, with here and there spots of white ashes, showing that ignition had actually taken place. It seems probable that if the casing had not been excluded from the air by the earth covering it, it would have blazed and been entirely consumed. It is generally believed that a steam pipe cannot set fire to wood, but this case seems to prove the contrary, and it may explain the origin of so many mysterious fires."

TO MAKE FLORIDA WATER.—Here are two formulas for manufacturing that favorite cosmetic, Florida water: (1.) Oil of bergamot, 4 ounces; oil of lemon, 6 ounces; oil of lavender, 1 ounce; oil of cloves, 6 drachms; alcohol (wine measure), 3½ gallons; water (wine measure), 6 pints. The oils and alcohol must be mixed and allowed to stand a day or two, after which the water should be carefully added. (2.) Oil of bergamot, 8 ounces; oil of orange, 4 ounces; oil of lavender, 3 ounces; oil of cloves, 1½ ounces; oil of cinnaman (true), ¼ ounce; tincture of orris, ½ pint; tincture of Peru balsam, ½ pint; alcohol, 4 gallons; water, 6 pints. Mix and let it remain quiet for some days, before filtering and bottling.

A PRESERVATIVE wrapping and packing paper, for protecting clothes, furs, etc., from mildew and insects, is among the recent minor inventions of note. The paper for this purpose is made from woolen and cotton rags, and manilla rope or paper. This is saturated with a mixture of 70 parts by measure of the oil remaining from the distillation of coal-tar naptha by live steam, with 5 parts crude carbolic acid, containing at least 50 per cent. of phenola, 20 parts of thin coal tar, heated to about 160° Fah., and 5 parts of refined petroleum. After saturation, the paper is passed through squeezes, and over hot rollers for the purpose of drying, and when cool, it is cut into sheets of suitable size, and the drying completed in the atmosphere.

BLACK ENAMEL.—If wood is immersed in sulphuric acid it is dyed a jet black, and when dry can be polished by rubbing with a hone spatula; but what would best suit, I think, is the following: Grind up very finely some drop black in water, put the paste in a cup and mix it with a little size or very thin glue, brush the wood over with this, let it dry, sandpaper it and give it another coat, allowing it to dry well, and again apply some worn emery or sandpaper. If well covered you may now use French polish when you will have a brilliant black surface. If it is not a flat surface, brush over with a coat or two of polish varnish, made the same as French polish, only a little thicker.

A LARGE BLOCK OF SANDSTONE.—At the Dark Hollow stone quarry, near Bedford, O., one of the largest stones ever blasted in this country was "lifted" a week or two ago. The stone is 40 by 50 feet square, and about 30 feet thick, and it required 185 slip wedges to make a successful blast. When cut up into pieces it will make nearly 300 carloads of building stone. Immense blocks of stone are frequently taken out of the quarries here which would make the stones in Solomon's Temple mere pebbles in comparison. Its weight was estimated to be about 6,000,000 pounds.

DRAWING ON PHOTOGRAPHS.—Where it is desired to obtain an India ink drawing from a photograph, without resorting to tracing, very nice results are obtained thus: Prepare a print in the usual manner. Instead of toning as usual, fix immediately in "hypo." Wash well in running water to get out all the hypo. Draw directly on the print with India ink. This finished, bleach with a saturated solution of corrosive sublimate (bichloride of mercury) in equal parts of water and alcohol. Flowing is better than brushing, for applying the bleach, as it avoids smearing.

DETECTION OF STARCH IN MILK.—The adulteration of milk by starch can be readily detected by the following method: Add a few drops acetic acid to a small quantity of the suspected milk; boil the milk, and after it has cooled filter the whey. If there is any starch in the milk, a single drop of iodine solution will give a blue tint to the whey. This process is so delicate that it will show the presence of a milligram of starch in a cubic centimeter of whey (1 grain of starch in 2-16 fluid-ounces of whey).

MULTIPLICITY OF PATENTS.—An illustration of the prolific capabilities of our inventors is the fact that over 240 patents appertaining to the art of soldering have been granted.

SALTS OF TIN.—A German technical journal says that salts of tin remove iron stains from linen much more efficiently than oxalic acid will do it.

AN IMMENSE BLOCK OF GRANITE.—What is said to be the largest block of granite ever quarried in the United States has recently been taken from a quarry at Vinalhaven, in Maine. It is 59 feet long, 5½ feet square at base, and 3½ feet square at the top. It weighs from 75 to 100 tons. It cost $1,700 to blast it and move it to the shed where it is to be finished. It is to form the shaft of the monument to Gen. Wool, to be erected at Troy, N. Y.

A WATER-PROOF CEMENT is prepared by a German chemist as follows: Dissolve 5 to 10 parts pure dry gelatine in 100 parts water; then add 10% of a concentrated solution of bichromate of potash. Articles united with this glue are exposed to the light of the sun, when the bichromate becoming reduced, the gelatine film attains great strength and flexibility. Glass ornaments and utensils, when broken, are said to be readily mended by this cement.

PRETTY EXPERIMENT.—If seeds (barley, corn, etc.,) be placed between moist pieces of litmus paper, the roots stick to the paper, and color it so intensely red that even on the back of the paper their course can be traced in red lines on a blue ground. If tincture of litmus be repeatedly added the intensity of the red color is increased.

SILVERED IVORY.—Ivory immersed in a weak solution of chloride of silver in cyanide of potassium, and allowed to remain until it acquires a deep yellow color, and then removed, dipped in water, and exposed to the sunlight, becomes black. Polishing the blackened surface until burnished gives it a silvery appearance.

PAPER THAT WILL WARP.—A new paper is now made of palmetto fiber which can be washed with soap and water, as one would wash a piece of linen cloth, then rubbed, wrung out, and dried. The paper resembles parchment in color. It is not as strong but is tough, although of uneven thickness.

BURRS IN WOOL.—To destroy burrs in wool M. Rene Leblance recommends, first, that the wool be thoroughly dried before it is freed from the grease; second, that the wool be pressed beneath heavy rollers, so that the burrs are crushed, and, third, that the wool be then treated in the usual way.

TO REMOVE blood spots from woolen goods of tender colors, it is proposed to rub them with the inner side of a crust of bread.

Good Health.

Bathing.

Once a week is often enough for a decent white man to wash himself all over, and whether in summer or winter, that ought to be done with soap, warm water and a hog's-hair brush, in a room showing at least 70 degrees *Fahrenheit*. If a man is a pig in his nature, then no amount of washing will keep him clean, inside or out. Such an one needs a bath every time he turns round. He can do nothing neatly.

Baths should be taken early in the morning, for it is then that the system possesses the power of reaction in the highest degree. Any kind of bath is dangerous soon after a meal, or soon after fatiguing exercise. No man or woman should take a bath at the close of the day, unless by the advice of the family physician. Many a man, in attempting to cheat his doctor out of a fee, has cheated himself out of his life; aye, it is done every day.

The safest *mode* of a cold bath is to plunge into a river; the safest *time* is instantly after getting up. The necessary effort of swimming to shore compels a reaction, and the effect is delightful.

The best, safest, cheapest and most universally accessible mode of keeping the surface of the body clean, besides the once-a-week washing, with soap, warm water, and a hog's-hair brush, is as follows:

Soon as you get out of bed in the morning, wash your face, hands, neck and breast; then, into the same basin of water, put both feet at once, for about a minute, rubbing them briskly all the time; then, with the towel, which has been dampened by wiping the face, feet, etc., wipe the whole body well, fast and hard, mouth shut, breast projecting. Let the whole thing be done within five minutes.

At night, when you go to bed, and whenever you get out of bed, during the night, or when you find yourself wakeful or restless, spend from two to five minutes in rubbing your whole body, with your hands, as far as you can reach, in every direction. This has a tendency to preserve that softness and mobility of skin which is essential to the health, and which too frequent washings will always destroy.—*Journal of Health.*

CAUSE OF SNEEZING.—Sneezing is occasioned by a clogging up of the capillaries in the nasal membrane, and a partial obstruction of the nasal passages; in which case a sense of irritation is produced which results in sneezing. This is a sort of crisis which tends to restore the function of the excretory vessels, by relieving them of the congestion.

NEW REMEDY FOR BURNS.—An iron foundry man recommends as "a never-failing speedy remedy" for burns and scalds powdered pine wood charcoal.

ALCOHOLIC ANÆSTHESIA.—In some experiments made by Dr. Hervath, a German physician, in the production of local anæsthesia, he states that if the hand be immersed for a short time in ice water, severe pain is caused, but that no such pain was produced on immersing the hand in cold alcohol, not even when the temperature of the alcohol was as low as 5° cent. Glycerine was found to possess a similar property. Ether caused pain and quicksilver more acute pain still, causing the speedy withdrawal of the finger when plunged into this liquid at a temperature of 3°. It was not ascertained that, on the finger being held for a long time in alcohol having a temperature of 5° cent., no pain was experienced, and, although the finger distinctly perceived the faintest touch, sharp pricks gave no pain. This seemed to show that the application of cold alcohol has the effect of depriving the part of the special sensibility of pain, without, however, impairing the delicacy of the general tactile sensation, which, as is well known, resides in the superficial integument.—*Materia Medica.*

HUNGER.—If a man in good health has not eaten anything for some days, he will die if he eats heartily. When persons are found in an almost starving condition, light food, in small quantities, and at short intervals, is essential to safety. The reason is, that as soon as we begin to feel hungry, the stomach rolls and works about, and continues to do so, unless satisfied, until it is so exhausted that there is scarcely any vital energy; it is literally *almost tired to death*, and, therefore, digestion is performed slowly, and with great difficulty. Hence, when a person is kept from eating several hours beyond his usual time, instead of eating fast and heartily, he should take his food with deliberation, and only half as much as if he had eaten at the regular time. Sudden and severe illness has often resulted from the want of this precaution, and sometimes death has followed.—*Journal of Health.*

DRINKING BLOOD.—It is said that between 200 and 300 men and women of St Louis drink daily from a half to a pint of blood, piping hot from the veins of slaughtered cattle. More blood-drinking by consumptives and aged persons is done in September and October than during the remainder of the year. The blood of young steers is the best, and should be caught as it comes from the animal, and should be drunk while the foam is still on and the steam rising. Consumptives are advised, in addition to drinking the blood to eat in a slaughter-house for a couple of hours each day at killing time to inhale the "steam" of the running blood.

WARTS.—If they give you no special inconvenience, let them alone. But if it is of essential importance to get rid of them, purchase half an ounce of muriatic acid, put it in a broad-bottomed vial, so that it will not easily turn over; take a stick as large as a knitting-needle, dip it into the acid, and touch the top of the wart with whatever of the acid adheres to the stick; then, with the end of the stick, rub the acid into the top of the wart, without allowing the acid to touch the well skin. Do this night and morning, and a safe, painless, and effectual cure is the result.

SHADED STREETS PROMOTIVE OF HEALTH.—All medical writers agree that shaded streets are an essential element to public health; that trees absorb miasma, purify the atmosphere, create currents of air, and produce a refreshing coolness. A tree is never at rest, even in a dead calm. It is always fluttering its foliage, and stirring up the stagnant atmosphere around it. A special fund ought to be granted the department of highways for the planting of trees on all new and principal streets of the city.—*Philadelphia Press.*

FROZEN MEDICINES.—Dr. Edwin Andrew, of New York, finds that many drugs can be given with superior advantage by first freezing them. Anti-septic, astringent, anti-emetic and nauseous medicines come under this heading, and can be combined with ice without difficulty. An especially good feature of this plan is in its affording a possibility of the stomach's retaining medicines which it would reject when given in ordinary ways.

THE FIRST SIGN OF CONSUMPTION.—It is not as extensively known as it ought to be, that, in the large majority of cases, consumption begins with a slight cough in the morning on getting up. After a while it is perceived at night on going to bed; next there is an occasional "coughing spell" some time during the night; by this time there is a difficulty of breathing on any slightly unusual exercise, or in ascending a hill.

THE EFFECT OF IGNORANCE.—A correspondent of the *British Medical Journal* states the diphtheria is raging among the peasant children in Southern Russia. In some localities no child under 12 is to be seen. Filth and ignorance are doing their work. "When a child dies of diphtheria a little cake is put into its mouth and left there a few moments, during which every one present makes the sign of the cross. It is then taken out and administered in tiny morsels to the other children of the family."

EASILY FRACTURED.—The three sons of Z. D. Bowen, of Wadley, Ga., all use crutches. Their bones are so soft and brittle as to often break from even a slight jar. The oldest, Sylvester, has already sustained twenty-six fractures.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—The Mines of Amador County; The Cable Grip; Myer's Horizontal Flume, 305. Quarterly Assessment of Noted Nevada Mines, 308. The Week; Practices that Call for Correction; Arizona—No. 3; Placer County Mines, 312. Scientific Discipline; Repointing Saw Teeth; Testing Boiler Iron; File Holders; Photographing Animals in Motion, 313. Noticee of Recent Patents; The Land Troublee in Tulare County, 316.

ILLUSTRATIONS.—Myer's Horizontal Flume, 305. Lengthening Circular Saw Teeth; File Holders, 313.

CORRESPONDENCE.—Late Rain Storms—Modes of Measuring, 306.

MISCELLANEOUS.—Globe District; Quartz Mining in Tuolumne County; Barcelona Mine; Iron Mountain; What Mining Has Done; The Skagit Mines—Nothing in them, 306. Notes on Pacific Coast Fish and Fisheries; Custom Ores; The Bonanza Mine, 310. Recent Decisions Relating to Patents, Etc., 311. Candelaria District, 314.

MECHANICAL PROGRESS.—Riveted Boiler Joints; New Method of Making Belts; Boiler Explosions in England; One-Story Factory Building; A New Cask and Barrel Hoop; Hardening Small Tools, 307.

SCIENTIFIC PROGRESS.—An Expert's Story of the Missouri Tornado; New (?) Metallic Elements; Causes of Fatigue in Reading; Electric Phenomenon; Important Spectroscopic Observations; Distribution of Atmospheric Pressure; Fall of Meteoric Dust, 307.

MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Noticee of Assessments, Meetings and Dividends, 308.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana and Utah, 308–309

USEFUL INFORMATION.—Woodwork Burned by Steam; To Make Florida Water; Black Enamel; A Large Block of Sandstone; Drawing on Photographs; Detection of Starch in Milk; Multiplicity of Patents; Salts of Tin; An Immense Block of Granite; Pretty Experiment; Silvered Ivory; Paper that will Warp; Burrs in Wood, 311.

GOOD HEALTH.—Bathing; Cause of Sneezing; New Remedy for Burns; Alcoholic Anæsthesia; Hunger; Drinking Blood; Warts; Shaded Streets Promotive of Health; Frozen Medicines; The First Signs of Consumption; The Effect of Ignorance; Easily Fractured, 311

NEWS IN BRIEF on page 316 and other pages.

Business Announcements.

Iron Pipe and Plumbers' Stock—Richards & Snow, S. F.
Sea Shells—Florence Percy, Cordero Valley, San Diego Co.
Assessment Notice—Gover M. and M. Co.
To Quartz Miners—Almarin B. Paul, S. F.
Foundry For Sale—John Caine, Stockton, Cal.
Museums and Collectors—Mr. Damon, Weymouth, Eng.

The Week.

The past week has been one of conflict between winter and summer. For nearly half the time the weather was showery, cold and disagreeable, but the heavens have assumed their wonted clearness again, and a victory for summer is recorded. The rain extended over a greater portion of the State, but was not so heavy in the interior as in San Francisco. In the mountain counties the effect will be to increase the water supply and prolong the season for placer mining, which is receiving more attention this season than for several years past. The spring is indeed an auspicious one for the miner, and an unusually prosperous year is expected.

Business throughout the State is looking up a little, owing to the favorable outlook for both the mining and agricultural interests. The news has at last come that the letter-carrying business of Wells, Fargo & Co., is not to be interfered with by the postoffice department. The Postmaster-General has acted wisely in heeding the unanimous opinion of the press and people of the Pacific coast in regard to this question.

We give in another column the features of the changes proposed for the new mining law, which are much less sweeping than those originally considered.

AGATE INTO ONYX.—Two Germans have patented a process for converting ordinary agate into onyx. Lorenz & Cullman place the cut and polished agates for a week in a solution of iron in nitric acid only one millimeter deep, and then treat those portions of the stone which are to be white with a solution of equal parts of carbonate and hydrate of potash, dried and burned in an earthen pot until the desired color is obtained.

Practices that Call for Correction.

It is much to be feared that a rather loose, if not shamefully, lax state of ethics has come to obtain in the business of manipulating mining properties for sale on this coast. We do not allude now to those more infamous but less prevalent crimes that in some localities have in times past tainted the judiciary, disgraced the bar and tended to subvert the whole machinery of justice. Barratry, bribery, subornation and perjury are offences so gross and intolerable that their too rapid spread tends itself to work their early correction, and which do not, therefore, require to be specially commented upon by the public press. But there grows up sometimes in certain lines of business a school of practice which, though equally violative of the spirit and letter of the law as these more heinous crimes, by reason of its becoming popularized, long escapes both punishment and rebuke. This sort of practice has, we fear, come too much into vogue in the class of transactions mentioned above. We notice in a late issue of the Sonora *Independent* some well-timed strictures on the habits so common among mine owners of misrepresenting the condition and value of properties for which they are desirous of effecting a sale—these remarks having been provoked, as we infer, by some events of the kind recently occurring in that vicinity. But a little amplification of this sort, or even a simple misstatement of facts, are under the circumstances mere peccadillos, so natural and so harmless that they may be excused or at least overlooked. They are not the class of offences we set out to comment upon, and which call for not only public condemnation, but which should meet with speedy repression and exemplary punishment.

To illustrate, we cite what may be considered a case in point. A mine viewer—a man well qualified for the business—having not long since been called upon to examine and report upon a mine in this State, proceeded to do so with his usual care, sampling the ore from all exposed parts of the vein. While taking his dinner the sack containing those samples was by an agent of the mine owners adroitly removed from the buggy where it had been left and another, filled with a better grade of ore, but exactly resembling the sack abstracted, having been prepared for the purpose, substituted in its place. Through this dastardly trick this expert, without any fault of his own, was betrayed into a gross over-estimate of the value of the mine, whereby the subsequent purchasers suffered serious loss.

Again, and still more recently, it is strongly suspected that another and equally well qualified mining expert has been misled in the matter of calculating the value of the ore on which he was experimenting, his mill runs having been salted upon him by some one in the interest of the mine owners. Through the perpetration of this mistrusted fraud a sale of the property, at the time pending, was effected, and now the purchasers have to lament that they paid for it two or three times its real value. Another method adopted for misleading the investing public lies in the practice of publishing portions of the reports of experts, which, separated from their context, convey a false impression of their purpose and meaning as a whole; the authors of these mutilations sometimes going so far as to alter estimates and figures with the evident intention to deceive. It is not long since we saw the estimated depth of a hydraulic gravel bank which the mine viewer had in his report given at 500 feet altered, in what purported to be an extract from that document, to the preposterous depth of 1,500.

Now parties engaged in this sort of thing should remember that they are not only violating the most commonly recognized principles of morality, but that they are making themselves liable to a civil suit for damages as well also as exposing themselves to be proceeded against criminally, and that if persisted in these practices will be very likely to involve them in serious trouble; the reason they have so long escaped their just deserts being the good natured indifference heretofore manifested by the community toward this class of crimes. That parties aggrieved will always prove this lenient is by no means certain, nor is it desirable that these cheats and swindlers should longer escape the just consequences of their disreputable and fraudulent acts.

EVERY man who fancies he can distinguish ore from porphyry who goes to New York, immediately sets up as a mining expert. He has himself interviewed by the mining papers and talks knowingly of shafts and winzes and stopes and hoisting works and stamps and amalgamating pans and formations and gangues and lodes and veins and seams and faults, and manages to make the interviewer think him the man who built the Comstock lode. Some of these experts talk as if they could put ore in a barren mine, or make a granite boulder assay ten thousand dollars a ton. There are mining men in the East who know a mine when they see it; but the majority of the self-constituted experts now spreading themselves in Eastern cities are frauds.

THE May rains will have a tendency to prolong the hydraulic mining season.

Arizona.—No. 3.

Early Towns and Missions.

The Apaches, once the conquering tribe, and the terror of all the more peaceful and more civilized Indians, as well as of the whites, have suffered many mutations; but the Pimas, Maricopas, Papagoes, etc., have been located nearly as they are now for over a hundred years at least, as is proved by an old Spanish map, date 1775, which shows California, Arizona, New Mexico and part of Nevada.

At that date Tucson was the Presidio of Tuquison, and was the most northern settlement of the Spanish crown in North America. To the west of Tuquison no white settlement existed except San Diego. South of Tucson was the still existing though once deserted Tubac, and south of the latter some 30 miles stood Terentes, of which no trace remains. West of this on the Santa Cruz and near the southern spurs of the Santa Ritas, once stood the pueblo of Calabasas, the name of which still clings to a ranch and watering place about eight miles from the Sonora line.

Besides the towns, the Jesuits established three missions for the conversion of the Indians. These were San Xavier del Bac in the Papago district near Tucson, still standing in good preservation; Tumecarori, in the Apache country near Tubac, the ruins of which are still to be seen; and Cowpera, on the boundary line of Mexico. That their missions were attended with some spiritual as well as temporal results is evident from the fact that to this day all the Indians of southern Arizona, Apaches excepted, are good Catholics.

Tucson is said by some to be one of the oldest settlements in the United States, and to antedate New York, while others give the year 1769 as that of its first foundation. It appears to have always been the principal settlement of the region. The Mission San Xavier del Bac is said to have been founded in 1690, but the present edifice was built about 1785. Religious services are still held in it, the building and accessories being kept in repair. The walls are profusely decorated with sacred paintings, and as it is but a pleasant carriage drive from Tucson, it has become quite a resort for pleasure seekers as well as the curious.

Tubac, now again awakening to life, was once a flourishing pueblo of the King of Spain.

An Old Document.

The conditions under which the poor inhabitants were compelled to live while under Spanish rule, are well set forth in a document found 25 years ago in the archives of Tucson. This document is the report and complaint of Manuel Baragua and two others, in the name of the entire community of Tubac, to the Capitan of the province. It states that Tubac is between two mountains six leagues apart, in a valley which has much fertile land suitable for wheat or corn, but without enough water for the latter unless the water of Tumecarori be distributed every alternate week to supply the need. After speaking of the abundance of cottonwood and willow in the valley and of pine upon the Santa Ritas, six leagues away, the complainants allude to the mineral riches.

In the vicinity of Aribac (Arivaca), about seven leagues away, are, they say, many mines of very rich metals, three in particular, one of which yields a silver mark for one arroba (25 lbs) of ore; the second, six marks from a load (100 lbs); the third a little less. Three leagues beyond this, in the valley of Bobocomori, they allege the existence of fine gold placers, known to the whole community of Tubac, who went to view it; and in the Santa Ritas five silver mines are spoken of.

Then comes the complaint: The silver mines are known, but cannot be worked because of the Apaches, who live there and continually pass to and fro to the hot springs four leagues away. Daily having more violence (thus runs the tenor of the complaint) from the enemy because of the few troops we have, we desired to break up our homes and sell our effects; but as you imposed heavy penalties on us if we did so, we obeyed your order. Last month the Apaches finished off our entire herd of horses and cattle, destroyed the fields and carried away all the corn they could. Since the fort was removed to Tucson, the town of Calabasas has been burned. Also, a few days since, the Apaches came from the west, and for three days grazed around, taking corn from our fields and taking off those they found there, and we momentarily expect them to serve us and our families as they have served our property. The petition concludes with an earnest prayer for pity and help—for troops to protect homes, flocks and herds.

At last, after blocking up their doors and windows with mud bricks for defence, the inhabitants fled to Tucson. But a bold individual named Smith, held his ranch in spite of all the efforts of Cochise, the Chiricahua chief, who, after Superintendent Wrightson, of the Tyndall mines, had been slain in the mountains where he had ventured against the advice of Smith, one day surrounded the latter's house with 20 Indians. But Smith was a match for them. A brave Mexican woman, whom he afterwards married, loaded his rifles, while he, from the loop-holed window, picked off all who dared show themselves, and at last, the Indians—what were left of them—were forced to retire.

In 1817, Dionisio Rohles, of Rayon, with 200 men, fought his way through hostile tribes for 70 leagues to the Santa Ritas, but was obliged to return with the loss of many men, and without finding any single mass of the pure silver, although they took home good store of treasure.

Old arastras and the ruins of rude, but effective smelting works still remain to prove the wide-awake ways of the old padres.

Cession from Mexico.

The portion of Arizona north of the Gila was ceded to the United States in 1848, but there was some misunderstanding between the two governments, in consequence of which the portion south of the Gila was acquired by purchase from Mexico in 1854, for $10,000,000. The Mexican government, displeased at this, banished Santa Ana, who had negotiated the sale. Arizona remained a portion of New Mexico until 1863, when it was constituted a territory.

Thus for five years after the discovery of gold in California, southern Arizona belonged to Mexico, and this, together with the almost complete absence of military protection during the civil war, coupled with the fierce enmity of the Apaches, accounts for the postponement of the settlement of Arizona until very recently.

When the Rebellion broke out the only Federal troops in Arizona shamefully abandoned it, to the number of 450. One hundred Texan guerrillas took possession of Tucson, and most of the inhabitants fled to Sonora, or stood ready to join the rebels.

J. Ross Browne, in his "Adventures in the Apache Country," says: "The few citizens and traders who remained loyal to the Government, and the managers and workmen employed at the mines, being thus left at the mercy of lawless desperadoes, roving bands of Apachee and Sonoranians, fled from the country as fast as they could procure the means of escape. Many of them were imprisoned, and some were murdered." The hostile Indians followed small parties and slaughtered them, and boasted and believed that they had conquered the American nation. The Sonoranians ransacked mines, stole machinery, and murdered the few employees left.

Tubac, the headquarters of the Arizona mining company, was held for 3 days by 20 men against besieging Apaches on one side and Sonoranians on the other. The Confederate troops burned all the stores, provisions and groceries, public and private, tore down the mill at Tucson, and destroyed everything they could lay hands upon. Nothing remained of Union rule until 1863, when it was re-established. Except a few American miners in the Cerbat and Hualapai mountains, and a ranch or two on the Salt river, a few Mexicans were all there was left.

The whites, to use the expression of Gen. Rosecrans, were on the reservations, the country belonged to the Indians. But at last Gen. Crook cleared the mountains of the Apaches, and their fugitive bands were gathered together upon the White Mountain reservation, where, with the exception of occasional renegades, the bulk of the tribe now remains.

Placer County Mines.

The Hidden Treasure drifting mine at Sunny South has just been sold to an English company—the price understood to have been paid being $245,000.

Breece & Wheeler's claim—the Paragon mine—at Bath, is working over 40 men in the drifts. It is reported that this mine is also soon to be sold to an English company—the price it is said being $300,000.

The above two noted mines are among the richest in California and have made large fortunes for their respective owners. In both the whole mass of gravel, from the surface down, contains gold, while that portion immediately overlying the bedrock is extremely rich in coarse channel gold. As an illustration of the latter, some time since in Breece & Wheeler's claim a timber was removed which rested on the gravel lying in a depression of the bedrock. This dirt was then washed and yielded $800, principally in large nuggets.

Pond's ditch, 60 feet of which went into Breece & Wheeler's pit in one of the recent slides, has been repaired by a flume around the break.

At the Newcastle hydraulic mine, near Pino, a fatal accident occurred last Monday, the 10th instant. This mine has just been opened, and the water was turned on and piping commenced, for the first time, on that day. A cave of the bank occurred, which caught two men before they could escape. One of them, named Burns, was instantly killed; the other was very seriously injured. The deceased leaves a wife to whom he was married only a week previous.

The Chicago mining company are sinking a shaft on their ledge near Penryn. On the 100 level they have drifted off 50 feet on the ledge each way from the shaft, and are now sinking the latter to the 200 level, in order to thoroughly prospect the ore body. The ledge is three feet thick and the ore uniform in character wherever opened, prospecting excellently.

The Alahama company at Penryn have their shaft down 150 feet, doing prospecting work only. The ledge is from three to four feet thick, and similar in character and prospects to that of the Chicago company.

THE latest mining excitement in Montana is in the direction of Horse Plains, at a point near the head of Thompson river, and about 100 miles from Missoula. The camp is called Maginnis Gulch.

Scientifio Discipline.

Nothing is more nnfounded than the lofty contempt which is yst manifested in certain qnarters towards subjects recommended for thoir practical ntility. There is yet lurking in most communities a certain caste whioh pridss itself in its idiotic opposition to the claime which acientific knowledge is forcing npon the attention of mankind generally. That such ie ths case can be owing only to a lack of sound jndgment, cansed by erroneous systems of education, whioh deal largely in fancies and cschew facts. But, happily, in the matter of education ths old order is being inverted, which exalted mere words at ths exponse of things, and wo are now bringing the resources of modern induction to bear in the process of mental disciplino. Sciance is fighting ite way holdly and fearlessly, depending not upon mere opinion, but romaining as fixed as the relation of man to the surrounding world. Its proper study fills up a void occasioned by the old etercotyped means of education. This deficiency mauifeste itself more in the lack of judgment than in any apparent weaknees of the other faculties. To bo convinced of this serious drawhick in sonnd mental development it is only necessary to observe society at large—so unconscious is it of any remedy for this defect that it almost ignores tbe condition or accepts it as a necessary fact. The wide-spread ignorance of tho methods and facts of scieuce, the prevalence of popnlar superstition and empiricism not only nmong the masses, but also in the higher and more cultivated classes, ovince a sad neglect of those fnndsmental laws which have been found hy experience to govern the conrse of things, so that a vast majority of poreone appear to be turned into the world uttsrly dcfenceless, and a prey to evente which thsy might control. We are suffering to-day from adulterations of food and drink, but we cannot look for relief to legislators, or to an enlightened public opinion, so long as the still-born learning of our high-pressure literary teachiug continues to usurp the place of n rational scientific training for an intelligent contemplation of ths world—of man and his requirements and interests. A striking illnstration of the lack of judgment in evsryday matters occnrred recently in Ohio. A vendor of "improved" lightning rode did an immense business in the sals of a rod, which was set on the roofs of buildings without metallic or other connection with the earth, except the material of the building itself. It was not until a man in Iown began to raise doubts as to ths ntility of the "new invention" that the imposition was discovered. The matter was brought into the courts, where the testimony of experts clearly demonstrated the article to bs entirely worthless for the purpose for which it was so highly recommended. Many church committees hnd already invested in the sham, and the school board of Cincinnati had it placed on some of the school buildings. Such delusions will continue while the knowledge of physical science is neglected or confined to mere book-learning, instead of personal acquaintance with the facts and necessary truths of nature. The discipline afforded by a course of training based on the natural sciences, is the very best preparation for every department of human activity; nnd this alone is capable of enabling man to successfully meet the problems and difficulties presented by the ever varying phenomena which paeses before his eyes.

Ons of the results of a sonnd mental training ought to be the power of distinguishing between what is real and what is artificial, what is permanent and what is transitory; how to deduce the unknown from the known in the interpretation of nature. If the old regime fails to give this power it is well that we face the fact. The popular panics, excitements, violent public agitations and delusions which periodically possess whole masses of the people, educated and uneducated, indicate a sad want of judgment, and habits of logical thought, which can only be remedied by a rigid drill on man's relation to the necessary laws, forces and objects of nature. No one can reasonably object to the stndy of the natural sciences on the score of want of dignity in the ideas which they unfold, or the exactness and practical value of the knowledge and discipline they impart. The critical assaults and expreseions of distrust of our colleges and their systems of education, has led to many changes of late in favor of a more liberal culture in the physical sciences in conformity to the spirit of the times, and the urgent demands of modern progress.

Repointing Circular Saw Teeth.

Sometimes a circular saw tooth will strike a spike or a atone, or a knot and its sharp point he broken off. Instead of filing all the other teeth down to the length of this short one, it is best to lengthen the short one hy "swagging" or upsetting with a crotched steel tool, raising the swage in the act of upsetting. By this means the tooth point will be bronght from the condition ehown in Fig. 1 to that in Fig. 2 of the accompanying engravings.

One hundred bath-houses are being built on the beach near the railroad depot at Monterey, and the breakwater will be constructed immediately.

Testing Boiler Iron.

We witnessed this week, at the office of C. C. Bemis, U. S. Inspector of Steam Vessels a trial of ths Fairbanks testing scales, which is made especially for testing har and boiler iron. The capacity of the apparatue is 75,000 pounds, and is the only one of tho kiud on the coast.

The device works on the same principle as an ordinary platform scalo of the Fairbanke pattern, as far as the levers, etc. are concerned, the whole being nnusually heavy and strong. Tho upper chuck or grip is secured to a heavy iron arch, and ths lower one is secured to a cross-head having a powerful screw at each end, theso screws being rotated by gears so arranged that it takes 5,000 turns of the crank to draw the screws down one inch.

A picce of iron of specifiod dimensions is placed in the chncks, whero it is gripped by wedges having their inner faces corrugated and flat, and their outer faces smooth and rounding. Ae strain is brought to bear by tbe screws being drawn down, these wedges adjust thsmselves automatically so as to grip the bar on all parts equally.

The operator in turning the crank draws down the cross-head and lower ohuck by means of the gear nnd screws; nnd while the upper chuck remains stationary; great tensile strain is thue brought on the iron.

There are two beams, one having a weight or poise, which is placed at the point snpposed to he near the capacity of the iron. The other smaller weight or poise is on the emaller beam, is automatic, and is nrranged to slide along the beam. A cord running through a slot in the beam passes over a pulley at the end and has a weight nttached to it, the other end being connected to the sliding poise. As the strain on the iron operates the levers and the beam begins to rise, the pawl is released from the cord and the sliding poise moves along, registering the strain. If it reaches a position on the beam equal to the strain on the iron, the bsam drops and the pawl engages with the cord, stopping the movement of the poise. The poise, therefors, registere the strain as it gradually increases, The instant the fiber of the iron breaks the poise stops, as there is then only a lighter strain, which could not move ths poise. The mechanism is very delicate and accurate. Mr. Fairbanks, of the famous firm of scale makers, was present at the trial the other day, as was his partner on this coast, Mr. Hutchinson. A nnmber of gentlemen interested in the iron business in this city were also pressnt. Pieces of boiler iron, etc., were tested very satisfactorily for tensile strain. We shall on another occasion give a more complete description of the ingeniously contrived scale.

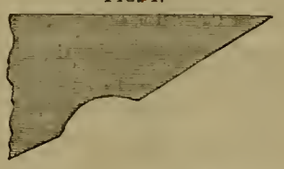

FIG. 1.

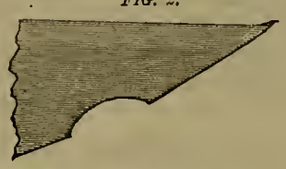

FIG. 2.

LENGTHENING CIRCULAR SAW TEETH.

File Holders.

To reach the center of large flat surfaces, ae printing press beds, etc., it ia necessary to hold the file in a special way. The eimplsst method is to heat and bend the tong as shown in Fig. 1 of the accompanying engravings. A better way, and one which does not necessitate rebending of the tong, is to have a "holder" such as that shown in Fig. 2. Thia receives the straight unbent tong and may be subetituted for the regulnr handle, or replaced by it in less than a minuts.

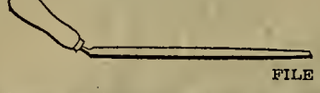

FIG. 1.

FIG. 2.

FILE HOLDERS.

Encyclopedia of Industrial Arts.—Parts 10 and 11 of Spon'a Encyclopdia of Industrial Arts maintain the high standard for practical and useful information which we have claimed for the earlier issues of the series. Part 10 has an elaborate article on candles, which shows the latest improved machinery used in this importnnt branch of manufactures. It contains also good articles on carbou, carbon bisulphide, catgut, cements, clays, etc. Part 11 has an exhaustive essay on the coal-tar prodncts, numerous and important as they are generally known to be. It also has comprehensive treatment on cocoa nnd coffee. The Encyclopedia is being brought out in parts of about 60 pages each, by E. & F. N. Spon, of Broome street, New York city.

The receipts for duties at the Custom-House in San Francisco, for the week were $94,954, making a total since January 1st of $1,955,276

Gold in Black Sand.

Nearly all of the heavy black sands of the auriferous districts of this State contain more or less gold, and in a few localities they also contain platinum and iridium. At a nnmber of points along the coast of both California and Oregon, where the surf has concentratsd and sspsrated these eands, they have been worked and although not altogether succcssfully, it was owing to the limited quantity of the eand available and imperfect and costly working. Where the Frne concentrator has been usod the sands have been worked with considerable profit.

This black sand is a varying mixture of minute particles of magnetite, iron and copper pyrites, or sulphurets, togethor with small qnantities of other unimportant minerals. The gold found in it is in part bright and clean, microscopic in size usually, but often large enough to be visible to the unassisted eye; most of it however, especially in the deep blue gravel mines, is what is called *rusty*, *coated*, or *black* gold. The exact natnre and cause of this peculiarity ie not fully understood. The gold seems to be covered with a film of some mineral, possibly arsenic or antimony, which prevents amalgamation. Still another form of occurrence which is quite common and important is where a small particle of gold is attached to or enclosed by a small fragment of pyrites. The larger part of the rusty gold is of thie description. The sand, hy assay, contains gold in value all the way from $10 to $1,000 a ton, even when unconcentrated.

In many of the hydraulic mines the hsavier black sand, which is caught in the riffles, is now saved and sold to metallurgical works, but it is obvious that at the present time by far the larger proportion of this sand passes through the sluices and undercurrents, and is practically lost in the immense mass of the comparatively barren tailinge which fill the canyons of the larger monntain streams. With it much gold is lost, especially coated gold. Col. Wilson the superintendent of the Pemberton mine nt Forest hill, has during the past winter been experimenting on the separation and concentration of these sands and the extraction of the gold they contain. Quite satisfactory and successful results have heen obtained, and in one of the late tests a little over one ounce of fine gold wae extracted from about a pint of concentrated sand. This sand, under the microscope, was seen to contain some bright gold, but more coated gold. After roasting the sand no difficulty was found in amalgamating the gold it contained. The writer, a year or two since, took thirty pounds of sand, and, grinding it with quicksilver in a large mortar, into which a stream of water was constantly flowing, obtained $50 at an outlay of $5. The sand wns taken from the tail sluice boxes and concentrated in a rocker from an original weight of 150 pounds.

Owing to the lnrge volume of water used in washing gravel and the high velocity with which it runs through the sluices, it is necessarily somewhat difficult to effect a perfect separation of the sand from the barren tailings and at the same time so concentrate it as to render it easily handled. In some claims an additional undercurrent is put near the end of the boxes for this purpose. Where the quantity of sand is large and its value high it might be practicable to use blankets. The sands thus caught can be further concentrated by mechanical consntrators. The snbsequent treatment by roasting and amalgamation, and chlorination presents no especial difficultice.

Justice Annual Meeting.—At the annual election of the stockholdere of the Justice mining company (Nevada), held on the 10th inst., 91,000 shares being represented, the following named gentlemen were elected to serve as a Board of Trustees during the ensuing year: J. P. Cavallier, George T. Marye, H. M. Levy, H. A. Unruh and W. Ayer. Mr. Cavallier was elected President; Mr. Marye, Vice-President, and R. E. Kelly, Secretary. Superintendent Curtis presented hie report, showing the tracing of the body of base ore in the mine from the 1300 to the 1650-foot level, but not containing a sufficient quantity to pay for extraction. All work was being done through the Alta shaft, which would make the expense of working the Justice mine the ensuing year very light. The Secretary's report showed receipts for the year amounting to $355,076 96; expenditures, $353,343 23, including $68,765.60 of old indebtedness. The present liabilities of the company are $25,112.51; cash in office and bank, $1,733.73.

Photographing Animals in Motion.

The wonders which the camera has wrought in the service of science and industry are far greater, in point of general interest and value, than its work as a delineator of humau form or features. At first the camera labored in the field of personality; afterward it entered the arena of ideas and became a demonstrator of truths of high value. The astronomer measures his observations of many celestial pheuomena upon the negative. The student of medical science pursues his most intricate examinations in pathology with the aid of photographs of magnified sections of nervous and muscular tissues. And descending to lower lines of scientific research and to the practices of useful arts, we find the camera entering nearly all of them, not only as a faithful servant, but many times as a master, pointing the way to the truth in science and the successful in practice. A most interesting volume could be writtsu upon the achievements of the photographer in the aid of human progress.

These somswhat trite remarks are suggested by the recent succeses of Mr. E. J. Muybridge, of this city, in hie elaborate efforts to produce faithful photographic analyses of the methods of motion in animals. He has succeded in catching movements which the eye is powerless to detect, because of their rapidity of execution, and the result is that many ideas based upon the faulty evidence of the sense of sight, although long held, must be replaced by others. We have, upon several former occasions, spoken of Mr. Muybridge's success in photographing animale in motion at Gov. Stanford's ranch at Menlo Park, but the leading steps of his process will hear rehearsal. There wae erected upon one eide of the driving track a long building for the cameras. These camerae are 24 in number, and are placed in the building in a row, one foot from each other. Each of the cameras is numbered. On the fence forming the backgrouud to the track are nnmbers, one foot apart, running from one up to twenty-four. From each of these numbers, and, therefore, one foot apart, pack-thread is stretched across the track in the direction of the camera opposite. Each thread is connected with a spring, which, when set, breaks the circuit of electricity in a system of wires running to shutters in front of each camera. The shutters are so arranged that upon closing the electric circnit, by the breaking of the threads, they fall down a certain distance, but in their fall expose the lense of the camera for about one five-thousandth part of a second. This, however, is sufficient to give a perfect photograph of the horse in the position he is in at the instant each of the shutter's fall. Thus the pace of the horse is photographed in every foot of the distance covered by the cameras. The 24 pictures thus made give every position taken in making a stride.

The latest demonstration of Mr. Muybridge's snccessful effort was shown at receptions given by him at his studio in this city during last week. His latest improvements include not only the secnring of accurate plates giving all the parts of the stride, but he has achieved a triumph in presenting these parts upon a screen in such a way that they enter iuto each other, and present a picture of progressive motion. It only differs from the motion of nature in that it is slower, and thue the eye is enabled to catch all its component parts. He has combiued the different photographic plates so that with the aid of the magic lantern and the zoogyroscope the picture of a moving animal is projected npon a screen.

Of the effect of this arrangement as shown by Mr. Muybridge in his preliminary exhibition a reporter of the *Call* eays: The spectator seee moving across the canvas horses trotting, running, jumping, or whatever gait they may take. As an animal moves along, the movement of every limb, of the head and tail are seen. The pictures are made to move much slower than the natural gait of the animals represented, thus allowing the spectator to follow every motion of the legs. The horse was presentsd in the attitude of running, trotting and lesping. In one picture a horse ran in one direction and another trotted in the opposite direction, and the animals appeared to pass each other on the canvas. One of the most successful was the horse jumping a hurdle. Here the animal, ridden by a jockey, came on a run from the right of the canvas, and leaped a hurdle near the other side. Following him came others, and a succession of leaping horses swept across the screen. Another very beautiful and very successful photograph was that of the greyhound running. Every different motion could be plainly seen, beginning with his leap into the air, the drawing of his legs together before alighting, and his return to the ground again. A furious bull dashed across the canvas, and every motion, including the terrifying motion of the tail, wae accurately given. A man running was also shown.

The experiments made by Mr. Muybridge show that the gensrally received opinions as to many positions taken by horses are uttsrly wrong. It has been thought that in running a horse left the grounnd on the hind feet. The photograph shows that he leaves it from one fore foot. This showe why running horsea break down sooner than trotters. In trotting it ie seen that the horse is off the ground a portion of the time. In the cass of Clay, one of Mr. Stanford's trottere, during a etride of 17 feet, the animal is off the ground alt gether fully nine feet. These experiments also show that the heel etrikee the ground first, and not the toe, as generally received.

Candelaria District.

We take the following items of interest from a letter to the Bodie *Free Press:*

The great drawhack to the town at present is lumher and water; hut notwithstanding this, there is considerahle huilding going on, some 14 stores and small dwellings being in course of construction, and many more are contemplated when the necessary material arrives, which is now heing delayed on the road by storms. There are now here 3 groceries, 2 harher shops, 13 saloons, 3 variety stores, 1 dry goods and furniture store, 2 restaurants, 1 news depot, 1 brewery, 2 clothing stores.

As to the mines, there is not a very great deal of work heing done at present, though, if indications amount to anything, prospecting will he very lively during the coming season, and from the looks of the "croppings" the prospector should reap rich rewards. The Northern Belle is shipping considerahle hullion, and the Mount Diahlo will follow suit at no distant day. The Holmes company are erecting a new huilding, the Black Metallic is pushing work, as are also the East Mount Diahlo, Monnt Potosi, Victor, Beauregard, and a number of others. Altogether, the mining outlook in this district will average with that of any like district in Nevada, and the prospects of Candelaria, taking everything into consideration, are very hright, and I predict that before the summer is over the district will he much more generally known than at present. Poor water is six cents a gallon; poorer water, five cents a gallon; one dollar per night to sleep on the floor; one dollar and a half to sleep in hed—if you can get it.

Men of ahility and experience can secure good pay and permanent employment. Send references and state your past occupation, etc., to the publishers of this paper.

SUB-IRRIGATION.

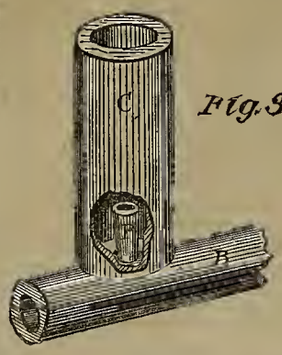

Fig. 3.

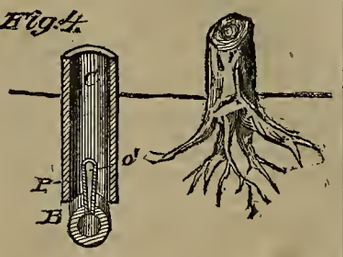

Fig. 4.

—FOR—

Orchards, Vineyards, Small Fruits, Alfalfa, Lawns, Vegetables, Etc.

The Ashestine System consists in conducting the water in concrete pipes laid below reach of the plow.

It saves from three-fourths to nine-tenths the water nsed in snrface irrigation.

It is under perfect control, and can he applied wherever irrigation is needed.

The surface remaining dry there is no need of Summer Cultivation, either before or after irrigating.

The soil is never excessively wet *and cannot bake,* hnt remains moist, loose and at a nearly uniform temperature, promoting a long-continued Summer's growth.

Anything which the soil lacks as plant food (mannre, lime, etc.,) can he easily, directly and economically applied in liquid form; the pest of the vineyard—phylloxera—can thns he easily reached.

No grading is necessary, as the system works perfectly on hillsides and undnlating land.

Roots *cannot* get into the pipe, neither can it *suck mud*—difficulties never overcome by any other system of snh-irrigation.

The pipe is made continuously with a recently patented machine which *makes and lays* it in the trench, following all the undulations and curves.

Water is not kept in the pipes; bnt is applied ahont twice a month.

Three men will easily lay 1,200 feet of two-inch pipe in 10 hours.

This system and machines used are fully protected by U. S. Patents.

Our pipe machine makes the cheapest and best tile drain known, and is especially valuable for making and laying pipe for conducting water from springs, out of canyons, etc.

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Hueme, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Meeker & Banks, W. O. Hoagland, S. & J. Newsom, B. Henrickson.

J. S. PHILLIPS, M. E., ETC.

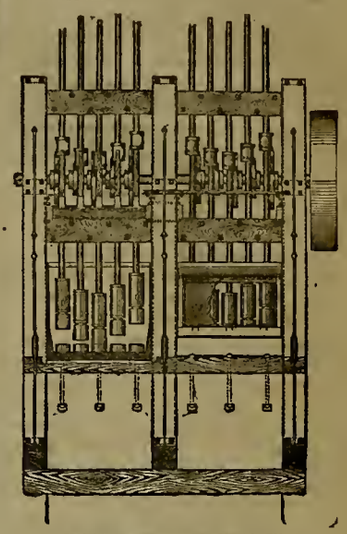
Machinery.

GOLD AND SILVER
Grinding and Amalgamating MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application,

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed.
Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid.

ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia.
March 10 1880.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

[From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

FOR THE WEEK ENDING MAY 4TH, 1880.

227,090.—VEHICLE SPRING—G. Aechenauer, Sacramento Cal.

227,273.—FIRE BOX FOR BOILERS—J. Mailer, S. F.

227,283.—MACHINE FOR FILLING CANS WITH MEAT, FISH, ETC.—A. H. Moore, Ellensburg, Orn.

227,179.—KITCHEN CABINET—I. B. Robbins, Stockton, Cal.

227,189.—ORE STAMP MILL—J. M. Thompson, S. F.

227,142.—TUBE FOR SURFACE CONDENSERS—C. B. White, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

MACHINE FOR MAKING METALLIC LATHS.—Charles H. Carter, of San Francisco. Patented April 27, 1880. No. 226,901. This machine consists in a series of rocking bending jaws, operated by proper mechanism, in combination with a mandrel. A sheet of metal of suitable dimensions is laid upon the mandrel or former. The eccentrics, as the shaft is rotated, force the sliding plates down, thus forcing down the oppositely placed arms or levers. These arms or levers force down the upper edges of the swing presser plates, the lower beveled or sharpened edges of which squeeze the overlapping edges of the metal plates from which the laths are formed down over the rounded edges of the former and into the crevice on each side, thus forming the lath. The eccentrics again raise the swinging plates and separate their lower edges, releasing the lath, which may be drawn out through the opening at the end of the machine, after which a new piece of metal may be inserted and pressed. Mr. Carter was awarded the inventor's gold medal at the fourteenth industrial exhibition of the Mechanics' Institute, 1879, upon this invention.

KITCHEN-CABINET.—Isaiah B. Robbins, Stockton, Cal. Patented May 4, 1880. No. 227,179. This device relates to certain improvements in kitchen-cabinets; and consists in certain details of construction and combination of parts, whereby the cabinet is enabled to hold flour and meal of different kinds, a rolling-board, rolling-pin, etc., all of which may be inclosed, and when ready for use the front drops down and slides out in a peculiar manner, so as to furnish a table on which bread may be mixed. When the cabinet is open and the leaves unfolded and drawn forward on the slides, said leaves form a table on which the bread-board is placed. The bins are all open in front of the person at the table, and the drawer also is within convenient reach. All the appliances for making bread, pies, etc., are at hand immediately in front. When the operation is over the bread-board may be put back in its slides, the draw closed, the leaves folded over and pushed back, and the front and cover closed, the whole being thus shut up out of the way and inclosed from the dust.

WASHING MACHINE.—J. Frellocher and F. Mahler, S. F. Patented April 27, 1880. No. 226,909. This invention relates to certain improvements in that class of washing machines in which the clothes to be cleaned are passed between rollers; and the improvements consist in providing a pair of circumferentially grooved or corrugated rollers, which are given both a rotary and endwise reciprocating rubbing motion by peculiar mechanism, operated by a foot-treadle, in combination with peculiar dogs or lugs provided with a swinging arm, by means of which the direction of rotation of the rollers is controlled, the dogs or lugs being provided with adjustable bolts, by which the feed of the rollers is regulated. The rubbing action of the rollers is such that the clothes are washed in a manner similar to the operation when performed by hand, while at the same time no injury is done to them, the rollers being mounted on elastic bearings. This machine is simple in operation and very effective, performing its office very much in the manner as if the clothes were washed and scrubbed by the hand.

BOLT HEADING AND POINTING MACHINE.—Alfred Magunson, S. F. Patented March 30, 1880. No. 226,090. This invention relates to certain improvements in machinery for forming complete bolts; and it consists in a mechanism whereby the bolt is headed in a manner similar to that now in use, and in addition it is cut off and pointed at the same operation. This device may be applied to the Lewis Bolt Header, in which a head is formed upon a rod of iron after heating. The rod is then cut off by another operation to the proper length, and the bolt so found is finally pointed by a third and independent operation. By this invention these three operations are performed as one, and the product is greatly increased thereby. It will be manifest that spikes, track rails and bolts of any shape either square or round may be made by this machine.

MACHINE FOR FILLING CANS WITH MEAT, FISH, ETC.—Asher H. Moore, Ellensburg, Curry Co., Oregon. Patented, May 4, 1880. No. 227,283. The object of this invention is to provide a means for mechanically filling the cans in which such articles as fish, meat and other substance not of a liquid nature are hermetically sealed and preserved, and put upon the market. Usually the fish, meat or similar articles to be preserved, after being cut up or put in the shape in which it is to be preserved, is placed in the can by hand. It is not always possible to completely fill the can in this way, no special pressure being applied, and, moreover, considerable time is consumed. The means which is employed by this device to facilitate the operation of filling the cans are such that the meat, fish, or other article, after being cut up in suitable-sized pieces and being placed in a hopper, is forced or fed by a plunger into a mold corresponding in size to the can. A knife then cuts off the mass, and another plunger forces the meat or fish from the mold into the can, which is then removed and sealed, the whole operation being automatically performed. This apparatus can be worked as slowly or rapidly as desired, it being expected that its speed will be regulated so as to keep one man busily engaged placing and removing cans, thus filling the cans very rapidly, and each one will contain the same weight of fish and meat.

AIR COMPRESSOR AND WATER LIFTER.—L. B. Lawrence and W. P. Hammon, of Oakland, Cal., and A. G. Strawbridge, of Sharon, Pa. Patented April 27, 1880. No. 226,918. This apparatus relates to certain improvements for raising water, in which the heat and pressure of a body of steam is employed to act upon a body of air within a tank or reservoir without the intervention of a piston or other mechanism, so that said air is compressed and expanded at the same time, and serves as a medium by which to transmit the pressure to a distant tank, from which water is to be raised to any desired point. This is accomplished automatically by the aid of certain mechanism, consisting, first, of an automatically-acting supply and exhaust-valve and a condensing-jet actuated by a valve. The invention further consists in an automatically steam-valve-operating device, whereby the water of condensation may be withdrawn from the air tank and employed to move the valve, and at the same time it may be used in its partially-heated condition to feed the boiler.

PREPARATION FOR COATING INGOT-MOLDS.—Augustus L. Simondi, Silver City, Idaho. Patented April 27, 1880. No. 226,933. In the casting of bars or ingots of gold and silver it is desirable to make clean, smooth and solid castings; but it is very difficult to do so. Various methods have been employed for this purpose, the principal being to coat the mold with oil or with the soot of resin or other smoky substance. When oil is employed it burns off rapidly and dries up, not having sufficient body, while the loosely attached soot is easily carried away in the pouring, thus leaving the iron of the mold exposed as before. This invention consists in the application of a compound to the interior of the mold, said compound being of such a nature and consistence that it will form a coating or film between the molten metal and the iron mold, and prevent the adhesion of air and the formation of blow holes, or other undesirable appearances.

VEHICLE AXLE.—Wyman C. Partlow, Oakland, Cal. Patented April 13, 1880. No. 226,454. This invention relates to certain improvements in the construction of wagon or carriage axles; and it consists in a novel construction and combination of parts whereby dust-proof cups are provided at each end of the spindle. The spindle which receives the wheel is made of iron somewhat smaller than the box within which it is to run. Upon this spindle two sleeves are shrunk, which extend toward the center of the spindle from each end, leaving space between them, so that the axle-box will turn upon and be supported by the sleeves, which is smaller and serves to retain a fibrous substance, which is saturated with oil or other lubricant. These sleeves are chilled or hardened so that the axle while having all the toughness of iron will also be provided with a perfectly hard surface for the purpose of the journal.

PIPE AND PLUMBERS' STOCK.—We refer those in need of iron pipe and plumbers' stock to the advertisement of Richards & Snow in another column. The establishment at 406 and 408 Market St., is an old and well-known one; the proprietary firm having, however, been recently changed by the retirement of Mr. Barker, and the accession of Mr. Richards to his interest. All the parties are of good business repute, and their trade in the items mentioned in their advertisement is large.

THE Superior Tribunal Justice of the Federal District of Mexico has asked that trials by jury be suspended, on account of the acquittal of several criminals lately.

The Land Troubles in Tulare County.

According to dispatches to the daily papers of Wednesday morning, the trouble between the settlers and the railway company in the Mussel Slough country, has resulted in bloodshed. A dispatch to the *Call* says:

United States Marshal Pool and W. H. Clark, the land grader, arrived at Hanford Tuesday morning to dispossess the settlers, and left Hanford at half-past seven to serve process on William Broden and others. The Leaguers collected and followed the Marshal, and overtook him three miles north of Grangeville, and commanded him and the grader to surrender, which they did. They then commanded Crow, a purchaser from the railroad company, and a companion named Hartt to surrender. Instead of surrendering, they leaped from a spring wagon and fired with a shotgun and rifle, killing James Harris, Iver Kuntson and John Hendarson, and wounding Archie McGregor, William Broden, D. Kelley and a man named Haymaker, all being settlers. The settlers returned the fire, wounding Hartt fatally, and as Crow retreated at some distance, a shot struck him, killing him instantly. There is great excitement at Hanford and vicinity, but the leaders of the League caution prudence.

This trouble has been anticipated some little time. On Monday it was reported that several parties, supposed either to be in league with the Railroad company or opposed to the interests of the settlers, had received anonymous warning to leave the country. Among those said to have been thus forewarned were M. D. Hartt and Walter J. Crow, who were looked upon as tools of the Railroad company, and who, in consideration of their service in dispossessing the settlers and thereby providing a test case, were to receive their land. Members of the League deny having sent these warnings to Crow and others. United States Marshal Poole and W. H. Clark, grader of railroad lands in the Mussel Slough region, arrived at Hanford Monday night, and took rooms at the hotel. Early on Tuesday morning they drove out of town in a buggy.

The presence of the Marshal becoming known after his having dispossessed one settler, squads of mounted men followed the Marshal and party. When they met the affray occurred which resulted in the deaths enumerated above. With regard to future proceedings, Marshal Poole says that he does not know what he shall next do in the matter. He will lay the matter before the authorities, but he does not see that they are in a position to help him. In the first place, there is no money to meet any expense of the Marshal's department, and in the next, Congress recently passed an act forbidding the employment of United States troops to enforce any civil process. The unfortunate difficulty is much to be deplored, and the rights of the case will only come out when a calm investigation is made.

The "Californian" for June.

The June number of the *Californian*, the new monthly magazine, is now out, and is an exceedingly interesting issue. There is great variety in its contents and two new departments—"Art and Artists" and "Books Received"—are added. The low price of this magazine places it within the reach of all—only three dollars a year—while each number contains matter to interest every member of the family. It is published at 202 Sansome street, San Francisco, where subscriptions may be forwarded. We copy the table of contents.

The Interoceanic Canal and Geographical Congress.....Ferdinand de Lesseps.
A Practical View of the Indian Problem....Guy Howard Shoshonee.....Joaquin Miller
Sand. Chapter VI.....J. W. Gally

Resources of Arizona.

In another column we give the third of a series of articles on Arizona, which have been compiled for the PRESS in order to give our readers as full and reliable information concerning that growing Territory as is at present attainable. As we have had to use the testimony of other writers, we can only say we have sought to give our readers the best at command. We intend soon to send a special correspondent to this new and important field, and to furnish every detail concerning the different mining districts and the material resources of the Territory which it is possible to procure. Our correspondent will visit the principal mining fields in Arizona and collect such statistics and details as are available. What we now give is somewhat general in its character. So great an interest is manifested in all that relates to the Territory, and especially its mining resources, that we shall spare no trouble to gather and publish such information concerning it as will be of value to our readers.

News in Brief.

A SMALL steam propeller has been put on Mono lake.

THE grain crop of Russia is seriously threatened by beetles.

THE land troubles in Mussel Slough, Tulare county, still continue.

THE Apaches are still giving trouble in Arizona and New Mexico.

THE U. S. Geological Survey took the field from Eureka, May 5th.

THE tobacco fly is devastating the tobacco plantations of Virginia.

RAINS and frosts have caused great damage to crops and vines in Spain.

THERE is great excitement in Cuba over a new insurgent conspiracy.

A PECULIAR and fatal disease is killing the sheep at Chestnut, Montana.

AN effort is being made to manufacture silk in Salt Lake on a small scale.

A SWEDISH colony, numbering 800, will come to eastern Oregon this summer.

BEDS of young oysters have been discovered at the Terrace Baths in Alameda.

THE surveyor of the James single track railroad has begun work at Antioch.

FOR the first time in 58 years it is now legal to smoke on the streets of Boston.

REPORTS from southern Oregon predict a bountiful harvest the coming season.

IT is estimated that 5,000 acres will cover the entire loss by flood in Colusa county.

MINISTER ANGELL will probably leave San Francisco for China on the 10th of June.

THIRTEEN fishermen lost their lives at the mouth of the Columbia river during the recent gale.

THE track of the Southern Pacific railroad is now laid nine miles east of Pantano, Arizona Territory.

M. COMADANOSE, a well-digger, was killed by noxious gases in a well in San Joaquin county, April 29th.

EIGHTEEN persons were killed or wounded by the explosion of a dynamite magazine at Faido, Switzerland.

THE new Normal School building at San Jose is to be constructed of granite and brick, and is to cost $130,000.

PHILADELPHIA proposes to save $150,000 a year by having its streets cleaned by the inmates of its House of Correction.

RUSSIA proposes to transfer her Embassy from Pekin to Shanghai, on account of the excitement at the former place.

PART of the roof of the St. Gothard tunnel, 6,300 meters from the south entrance, fell last week, killing three workmen.

THE Nicaraguan government has granted liberal concessions to the American Government for an Inter-oceanic Ship Canal Co.

THE phylloxera has appeared in the vineyards near Naples and Messina, and other parts of Italy, where it was before unknown.

CHONG HOW, late Chinese Ambassador to Russia, and contractor of the treaty of Lavodia, is to be decapitated, his sentence having been approved by the Empress.

BATANGO, an African village on Cameroone river, west coast of Africa, was bombarded and burned by the British, on account of the capture and ill-treatment of British subjects by the natives.

AMERICAN citizens in Peru claim, through the United States Government, indemnity from Chile for all losses and damages whatsoever they have suffered or may hereafter suffer through acts of the Chilean forces.

THE Society of California Pioneers intend erecting a fine new building with a frontage of 80 feet and a depth of 190 on the southwest corner of Fourth and Market streets, San Francisco, some time the present year. The expense of building the edifice is set at $100,000.

By Universal Accord,

AYER'S CATHARTIC PILLS are the best of all purgatives for family use. They are the product of long, laborious and successful chemical investigation, and their extensive use, by physicians in their practice, and by all civilized nations, proves them the best and most effectual purgative Pill that medical science can devise. Being purely vegetable, no harm can arise from their use. In intrinsic value and curative powers no other Pills can be compared with them, and every person, knowing their virtues, will employ them, when needed. They keep the system in perfect order, and maintain in healthy action the whole machinery of life. Mild, searching and effectual, they are specially adapted to the needs of the digestive apparatus, derangements of which they prevent and cure, if timely taken. They are the best and safest physic to employ for children and weakened constitutions, where a mild but effectual cathartic is required.

FOR SALE BY ALL DEALERS.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

Chew JACKSON'S BEST Sweet Navy Tobacco.

A Cheap Home Among the Orange Groves.

There is now for sale one of the finest locations adjoining the town of San Gabriel, seven and one-half acres of choice land; two-story frame house (partly unfinished), within one mile of postoffice and railroad station. Near church and school. One acre of oranges just in bearing. Peach, apple, almond, nectarine and pomegranate, also in bearing. Corner lot. Reference, RURAL PRESS office. address SETH MOSELY, proprietor, San Gabriel, Cal. [1]

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Mining and Other Companies.

Pereons intereeted in incorporated eharee will do well to recommend the publication of the official noticee of their companiee in thie paper, as the cheapeet appropriate medium for the eame.

Atlanta Mining Company.—Location of principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, April 29th, 1880, and day of sale to Monday, May 24th, 1880. By order of the Board of Directors. A. F. McGREW, Secy.

Office—Room 7, No. 420 Montgomery Street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, May 21st, 1880, and day of sale to Wednesday, June 23d, 1880. By order of the Board of Directors. A. F. McGREW, Secy.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

Gover Mining and Milling Company.—Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given that at a meeting of the Directors held on the Fifth day of May, 1880, an assessment (No. 42) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twenty-first day of June, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Wednesday, the Fourteenth day of July, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office—402 Front street, room 8, San Francisco, California

Palmer Ice and Refrigerating Company.—Location of principal place of business, San Francisco, California. Location of works, 224 Fremont street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of April, 1880, an assessment (No. 2) of 25 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, No. 303 Montgomery street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 24th day of May, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 17th day of June, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. O. O. PALMER, Secretary.

Office—No. 303 Montgomery St., San Francisco, Cal.

ANNUAL MEETING.

OFFICE OF THE

Pioneer Consolidated Mining Company,

A meeting of the stockholders of the Pioneer Consolidated Mining Company for the election of a Board of Trustees to serve for the ensuing year and for the transaction of such other business as may come before the meeting, will be held on MONDAY, the Twenty-Fourth day of May, 1880, at 2 o'clock P. M., of that day, at the office of the Company, Room 4, 300 California street, San Francisco California. Transfer books will be closed on Friday, the Twenty-First day of May, 1880, at 3 o'clock P. M.

J. M. BUFFINGTON, Secretary.

Office—Room 4, 309 California street, San Francisco California.

DIVIDEND NOTICE.

OFFICE OF THE

Standard Consolidated Mining Company,

San Francisco, May 1st, 1880.

At a meeting of the Board of Directors of the above named Company held this day,

Dividend No. 15 of Seventy-five Cents (75c)

Per share was declared, payable on Wednesday, May 12th, 1880, at the office in this city or at the Agency of the Nevada Bank of San Francisco in New York.

WM. WILLIS, Secretary.

Office—Room No. 20, Nevada Block, No. 300 Montgomery Street, San Francisco, Cal.

Improved Grounds For Sale

NEAR SAN JOSE.

The subscriber offers for sale a tract of land, 40 acres in extent, located half a mile south of the road from San Jose to Alum Rock, and four miles from San Jose—directly in the warm belt of the foothills. The grounds are pleasantly and conveniently located, and under a high state of cultivation.

Five Acres in Orchard,

— CONSISTING OF —

Orange, Lemon and Lime Trees, Nuts,

FIGS, ETC.,

Together with a great variety of other Fruits, large and small, and GRAPES. TWO ACRES are set off for an

ORNAMENTAL GARDEN,

Which is now filled with Shrubs, Flowers and a fine growth of ORNAMENTAL TREES, 170 in number, now 11 years old. In connection with these grounds there is now a

Small Cottage and Farm House,

Well built and hard finished. On the higher ground there is a

FISH POND,

40 by 80 feet in extent, and 8 feet deep, well stocked with Carp. The pond is supplied with water from a never-failing spring a few feet distant, which delivers 24,000 gallons of water every 24 hours the year round. The pond is at an elevation of 20 feet above the house, and from it pipes are laid for irrigating the orchard and garden, and supplying the house.

Forty-three acres additional will be sold if desired, making a total of 83 acres.

This place affords a rare opportunity for anyone desirous of securing a well improved locality for an elegant country residence, and will be sold at a great bargain. For further information apply either at this office or of the proprietor on the premises.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

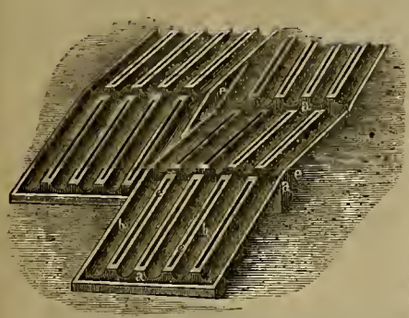
Hoisting and Pumping Machinery.

Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

We call the attention of all desiring such a Powder to our various grades, which are prepared to sell at LOWEST RATES.

No. 1.—Equalling Liquid Nitro-Glycerine in Strength. We recommend this Grade in extremely hard rock, houlders, iron, etc.

No. 2.—Will do the work thoroughly in all but the hardest kinds of rock.

No. 3.—For hench work, pipe-clay, soft and shelly rock, outside work and quarrying.

Single and Triple Force Cape, Fuse of all Grades, Vulcan Powder Thawing Boxes, Batteries and Exploders, For Sale at the Lowest Rates.

ALMARIN B. PAUL, Esq.—DEAR SIR:—After a trial of your AMERICANIZED ARASTRA we are prepar d to say that it runs with less than five-horse power and its capacity all that is claimed for it, viz: Ten tons p r day, receiving ore from No. 20 Screen. It runs splendid, and the more we see of it, the better we like it. It gathers much more float gold than we expected it would, and we cheerfully recommend it to the attention of quartz miners as a most thorough rule rizing, amalgamating and concentrating machine. Yours truly, P. W. JOHNSON & Co.

This Arastra can be seen and circulars had, by applying to ALMARIN B. PAUL,

Room 20, Safe Deposit Building, San Francisco

VOLUME XL Number 21.

Chlorination Vats for Gold Ores.

We take from the new edition of "Roasting of Gold and Silver Ores," by Guido Kustel, engravings of two forms of vats used in the chlorioatioo of gold ore in sulphurets.

After the ore has been properly roasted, it must be moisteoed before iotroduced into the chlorioating vat. The sulphorets, if dry, form a more condcosed mass than in a certain damp conditioo, and are, therefore, more obstructive to the ascendiog gas; besides, the chlorino does not attack the dry ore as vigorously as when it is damp. It is, therefore, indispensable to moisten the sulphurets after they are sufficiently cool. For this purpose the roasted charge, or several tons, are spread on the floor and water sprinkled over it by means of a hose, or otherwise, and turned over several times till it appears uoiformly wetted. The moistened charge should oot create the slightest dust, and at the same time the hand should remain dry on handling it. A handful of it pressed hard together must form a lump, which cao be held with the fingers, but falls into its former loose condition if handled. This moisteued ore always contains some lumps formed in the furoace; sometimes it may happen that a nail or screw is charged with the ore. Iron is very injurious, if in the ore during the chlorination, and the lumps would not chloridize properly. For this reason, siftiog of the moistened ore is necessary. The separation of lumps and other impurities is not the only reason why siftiog should be done. The more chlorine gas that can be introduced into the ore-hox or vat, the surer will the chlorinatiou of the gold he effected; it is, therefore, important to sift the ore directly into the vat in order to have it therein in as loose a condition as possible, leaving more space between the ore particles for the chlorine gas. The sieve, about 8 meshes to the running inch, is 12 to 14 inches by 25 in the clear, the sides 5 ioches high.

The chlorination vat, into which the ore is sifted, by pushing the sieve to and fro, either on two scantlings laid over the rim of the vat or suspended on four ropes, is 7 to 10 feet in diameter, capable of holding 4 to 6 tons. These vats, or square boxes, are provided with false bottoms, in order to permit leaching and to allow the gas to expand below the whole mass of ore, and to ascend through the ore uniformly at all points. The arrangement of the filter bottom can be fixed in the same way in a vat; if preferred a cotton cloth can be used for a filter, but it is more expensive than a gravel filter, the cloth being soon destroyed by the chlorine. In case cloth is used, it is necessary to lay staves across over the cloth 4 inches apart, so that when the tailings are taken out by means of shovels, the cloth should not be reached and displaced.

Fig. 1 represents a tub filled with ore on a gravel bottom. Over the filter bottom, which is perforated with inch holes (or direct on the bottom of the tub), is spread, first a layer of clean quartz, 1½ to 2 inches square. In default of quartz, another kind of rock or gravel will answer the purpose, except lime rock, which absorbs a great deal of chlorine. Over the coarse layer smaller pieces are laid, and so on, decreasing in size till a layer of sand covers the whole, forming thus a filter of from 4 to 5 inches in thickness. This filter remains always in the vat; the shoveling out of the residue, therefore, must be done carefully on approaching the filter bottom. There are two holes communicating with the space below the filter bottom. One is for the reception of the lead pipe, *d*, or better, a rubber hose, by which the chlorine is introduced; the other, *c*, is provided with a hose for the discharge of the lixiviation. This side of the tub stands half an inch lower than at *d*.

To prevent the absorption of the gold solution by the wood, it is necessary either to keep the vat filled with salt brine for several days, to fill up the pores of the wood, or to coat the inside of the vat with asphaltum varnish, or a mixture of pitch and tar or oil. The pitch mixture must be applied while hot; the asphaltum varnish is preferable, as it penetrates the pores more perfectly than the pitch. In either case, however, after a long use, when the vat should be discarded, the staves should be burned and the ashes assayed for gold.

The moistened ore is then sifted into the vat, within about 6 inches of the rim, as soon as the drawing, leveled carefully, without pressing. The wooden cover, *a*, is laid upon the rim, after a piece of cloth, *b*, has been tacked to the side of the vat near the water-pipe, *l*, to prevent the jet of water disturbing the surface of the ore. The pipes, *i* and *l*, before the hose is used, must be closed with stoppers, also the hose, *e*. It is better, in place of the pipe, *l*, to have only a hole into which the hose is inserted, when the water is needed. The chlorine gas can be admitted now into the impregnating vat.

At Melrose, 6 square boxes, 6 by 5 feet, prepared on journals, admitted a very convenient and quick discharge.

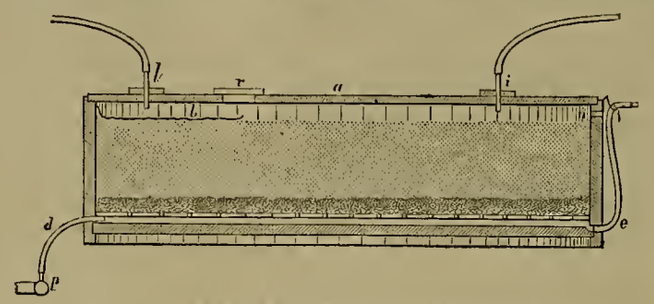

FIG. 1. GRAVEL BOTTOM CHLORINATION VAT.

Fig. 2 shows a vat that was planned by E. Riotte, for chlorination works in Japan. Vats of a similar shape were also used in Germany to chloridize the sand in the river Rhine. It is a deep vat, but since the roasted sulphurets filter always very readily, a column of sulphurets 4 or 5 feet deep still permits a good leaching. The vat measures 4 feet on top and 2 feet at the filter bottom, and is 5 feet deep. This arrangement has the great advantage of taking up less room, and having comparatively a much smaller filtering surface, the more convenient cotton cloth can be laid over the false bottom, which is perforated. But also a gravel filter between the bottom and perforated partition can be prepared, as described in Fig 1, which does not get out of order by being turned over. The gas is admitted through the lead pipe, *a*, provided with a cock, by which the pipe is closed, after the required amount of gas is passed into the tub. The same pipe, with another hose attached, serves for the discharge of the lixivium. The cover is represented in the drawing, after O. Hofmann's design. This arrangement makes the cover perfectly air-tight. After the joint on the periphery has been carfully luted with a good plastic clay, also around the two pipes, the whole cover is then covered with water about one inch deep. The clay, under water, of course cannot crack, and this is an advantage, especially then, if before leaching it was found at one of the pipes, that no surplus chlorine gas is in the tub, and a second charge of gas is required. Roasting of Gold and Silver Ores is for sale by Dewey & Co., 202 Saosome street, San Francisco, for $3 per copy.

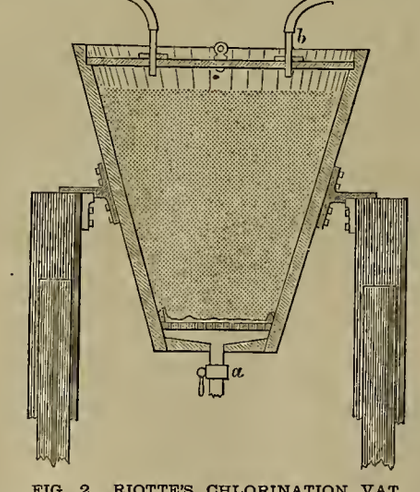

FIG. 2. RIOTTE'S CHLORINATION VAT.

The surface indications go to show that it is a true extension of the Idaho ledge, and as such is a valuable location. Mr. Dorsey was one of the original owners of the Idaho, and from an investment of $50 realized $45,000 in dividends; he has, therefore, considerable faith in that kind of a ledge in that place. The other directors are Jno. C. Coleman, Edward Coleman, Stephen Moore and Samuel Bethell. The new company have run a tunnel in 650 feet on the Maryland, and the drifts are 325 feet on the vein; found it to be the same vein, the quartz being identical. The top rock is not expected to produce anything, or until water level is reached, as were the case in the other mine which finally proved so rich. Steam hoisting works will be put up this season, and a shaft sunk upon the vein. The Maryland, in view of its position, is considered one of the most promising mines of the section. The original owners in the Maryland were the original owners of the Idaho mine, which produced nearly $6,000,000, of which $2,700,000 was distributed in dividends.

THE MARYLAND MINE.—We had the pleasure this week of meeting Mr. Samuel P. Dorsey, an old resident of Grass Valley and one of the gentlemen interested in the Maryland mining company, recently incorporated. The Maryland adjoins the famous Idaho mine on the east.

WATER, pure and free from alkali, has been struck at Red Rock, Arizona, between Picacho and Desert station, at a depth of 280 feet.

AN Italian expedition to the south pole is projected. Two winters will be passed in the Antarctic regions.

Geology and Human Development.

A writer in the *Victorian Review* asks the question, "Will the Anglo-Australian race degenerate?" He produces data and facts of a very interesting nature, which strongly indicate an answer in the affirmative. Observations seem to show that as is the geological development of a country such is the biological development of the animal life by which it is inhabited. That the human race has obtained its highest development in those regions where the soil had undergone its latest elaboration at the hands of nature. The main differences between the northern and southern branches of the Aryan race, who settled in Europe, is attributed to the influence of soil. The latest geologic formations are found in South Europe, Greece, France, Italy, Spain; also in England. Not so in Northern Europe, Australia and Russia. In the latter, large areas belong to the transition and secondary periods; while in Persia, Georgia and Circassia, where nature has carried her inorganic work to greater perfection, we find that here the human race attains its highest beauty and nobility. Note the contrast between Bohemia and the North country, as compared with the German or the average Greek; the Dane and Swede as compared with the Lapp and Finn; the Chinese south of Pekin and those in the north, around Lake Baikal. In Hindostan those tribes which inhabit a primitive region look like lower animals, while in the peninsula, in the same latitude, in the neighborhood of Bombay, we encounter one of the noblest and most beautiful types in the world—in soil of later or modern formation. The types referred to are permanent, because faces and figures cast in precisely the same mold are to be seen sculptured on the walls of the temples of Elephanta.

This parallelism between biological and geological development is still further shown from investigations made in France by man of the highest scientific attainments. Mayne says: "The geological distribution of the soil and the chemical composition of the arable lands, the climate, and certain economic and commercial circumstances, and the displacement consequent upon these, are the causes upon which depend the greater or less precocity of the bovine races." Duval calls attention to the peoples, the sheep and cattle of two districts in the same department of Aveyron. The Segala, who inhabit the older formation, are thin and wiry, while the Causse, who live upon the chalk formation, are more robust and better developed. Tremaux notices that the finest stock in France is reared on soils of recent formation, as in Normandy, Gascony, etc., while in Morvau, La Marche and Brittany, the animals of the same breed are small and scraggy. In view of all the facts adduced, we cannot fail to be struck by the intimate relations which appear to exist between geology and biology. That portion of our own country bordering upon the Gulf of Mexico is of later formation, and here we find that the Negro head makes the most rapid approaches to the Caucasian ideal. If indications are rightly interpreted, we must look to our Southern States for the Athens and Rome of America.

MEMORIAL DAY.—The 30th of May, selected as the day on which to decorate with flowers the graves of the dead soldiers of the Federal and Confederate armies throughout the Union, falls on Sunday this year. The late legislature of California passed a law making memorial day—the 30th—a legal holiday, and providing that when it falls on Sunday the succeeding Monday shall be observed; consequently, the soldiers' graves in this State will be decorated on the 31st this year. In the other States and Territories of the Pacific coast the ceremony will be performed on Saturday, the 29th. Active steps are being taken by the Grand Army of the Republic, national guards and citizens, to have the day observed in San Francisco in a becoming manner.

JUDGE T. K. WILSON has been elected Presiding Justice of the San Francisco Superior Court, vice Wm. P. Daingerfield, deceased, and department No. 3 recently presided over by Judge Wilson, was assigned to the newly appointed Judge, L. D. Latimer.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS

Tombstone District.

EDITORS PRESS:—This celebrated mining camp is just now attracting more attention than any other town or mining district on the Pacific coast. The village of Tombstone is situated in southeastern Arizona in latitude 31½°, longitude 109°, altitude, about 4,500 feet above the level of the sea, and some 500 feet above the San Pedro valley.

The town is handsomely located on a descending plain nine miles northeast of the San Pedro river. The streets are wide and run at right angles with each other, with perfect natural drainage. The municipal authorities consist of a Mayor and four Councilmen, Marshal and other officers. For peace and good order it will compare favorably with any town of its size on the Pacific coast. Present population 2,000; including the outlying mining districts about 5,000. The climate is splendid. The mercury in summer seldom rises above 95°, or in winter falls below 30°; and as to health it is superior to most of California towns. There has been no fog or dew since my arrival here in January last. The scenery, as viewed from the hills back of town, where the best mines are situated, is magnificent; the bold rock-ribbed mountains 20 miles to the north, the vast plains to the west as far as the eye can reach, and the high mountain ranges of the Whetstone and Huachuca southwest and far across the San Pedro river afford the lover of nature a scene of unusual beauty. The people are cosmopolitan in character, with a free and easy go-as-you-please style about them that tells the quiet observer at once that he is in the presence of old prospectors and miners that have followed every mining excitement from Alaska to Sonora. All kinds of business is well represented in this village. The merchant, mechanic, lawyer, doctor, dentist, machinist and assayer; the Catholics and Methodists have church organizations with a goodly number of members. We also have a free school, several hotels, restaurants and lodging houses.

The mines of this district contain free milling ore, known as chloride and carbonate, that mills from sixty to six thousand dollars per ton. Ore of less value than sixty dollars per ton is left on the dump, for the present, to be used at some future time when transportation and milling facilities will be cheaper. The best paying and well-defined mines at present are the Tough-nut, Contention and Good Enough. All of said mines have mills, on the San Pedro river, at Charleston and Contention cities, where their ore is hauled from the mines by large mule teams, at a cost of from four to six dollars per ton.

The Sunset, Grand Central, Empire, Head Center and Randolph mines are showing up richer ore bodies than the first-named mines, but have as yet no milling facilities to crush their ore. Most of the last-named mines have steam-hoisting works on their claims, and thousands of tons of ore on the dump ready for their mills in course of construction on the river.

As to the permanency of the mines in this district, there can scarcely be a reasonable doubt, as large fissure veins have been discovered and worked to a depth of 250 feet in several mines. All we need at present is capital to develop our mines and build mills to crush the ore. A good custom mill would enable the poor claim-owner to develop his own mine, as good milling ore can be had at a depth of twenty to sixty feet. Hundreds of poor miners here have good locations, but are only able to do their assessment work on their claims from year to year.

Wood and water are both scarce and of limited quantity. Water at the steam-hoisting works at mines is worth three cents per gallon; in the town it is sold at two cents per gallon. Wood is worth eight dollars per cord. This is a serious drawback to our prosperity, which may soon be overcome by the bringing into the mines and village the water of Sycamore springs, ten miles north of us in the Dragoon mountains, by a company of Boston capitalists. They propose to sell their water at one and a fourth cents per gallon, at which price they have a franchise from our city authorities to lay pipes in our streets, and have a monopoly so to do for the space of ten years.

The nearest point that the Southern Pacific railroad comes to our town is twenty-three miles, but a branch road is now in course of construction from that point to our mines and village. We are nearer Galveston than San Francisco. So when the railroad is finished and connections made, San Francisco will have to exert herself or she will loose a portion of her trade with us. RETLEF.

THE BARCELONA MINE.—The discovery of gold in the Barcelona mine, says the Belmont (Nevada) *Courier*, will add greatly to its value. As high as $80 per ton in gold has been returned from assayers in New York, and assays of silver from tunnel levels go as high as $1,446 per ton.

THE Ward shaft will reach the 2200 level next week. A drift will then be started to connect with the Bullion mine; also a drift will be started to prospect the Julia ground.

Prospective Processes.

The Robinson Process.

Mr. I. N. Taylor, of this city, who has recently been in New York, writes the following to the *American Exchange:*

It is during a period of intense interest in mining matters that the community wherein such an interest exists is usually apprised of the discovery of some new process for working what are termed rebellious ores. Almost every man who follows mining as a business, is likely to become not only interested but even excited over these so-called discoverics, as they have an idea that, sooner or later, a process will be discovered which will enable them to work such ores to a greater profit; therefore they are too ready to believe anything, however absurd it may be, that the inventor or discoverer claims will accomplish this object.

Composition of Ores.

It is a well-known and established fact that gold and silver in their natural condition, after their crystallization from a solvent state in fissures, are combined with iron, sulphur and arsenic, and often with other base metals. Iron and sulphur are as much the mother of gold as silica itself. There are many varieties of silver ores, but the principal ores from which the bulk of the silver comes that supplies the markets of the world, consist of the different sulphides or sulphurets. A pure sulphuret of silver contains 87 parts of silver and 13 of sulphur. Brittle silver ores are sulphuret and antimony, of which the composition is silver, 68.5; antimony, 14.7; and sulphur, 16.4.

There are several kinds of ruby silver ores. Antimonial ruby and red ruby are the most abundant. They only differ inasmuch as the red ruby carries a larger amount of arsenic, while in the others antimony predominates. The only other ore of much importance is the horn silver or chloride of silver. In a pure state, it consists of silver 75 parts and chlorine 25. The mixed ores, which are combined with lead, copper and other metals, are treated by the various methods of smelting, and do not enter into the subject of inquiry. Native silver and the chloride are the only forms in which silver is found free in nature. The chloride of silver was undoubtedly freed from its combination with other metals by being brought in contact with salt which is in the earth, and then being exposed to the oxygen. In certain localities, native silver has been redeposited from the chloride by electro-magnetism.

Methods of Treating Silver Ores.

The chloride of silver can be amalgamated up to a high per cent. of its assay value without any treatment, but all other ores require to be treated before they can be amalgamated, and in Europe the only successful way has been by grinding the ore to be treated to a fine powder, then mixing with the ore from 5% to 10% of salt, and placing it in what is called a step or reverheratory furnace, heating it to a temperature sufficient to eliminate the arsenic, which is the first to pass off; and if the ore carries gold great care is needed, for if the furnace is too hot when the ore is put in the arsenic will volatilize the gold, and it will not pass off in the fumes with the arsenic. After two hours the sulphur of the sulphurets ignites, burns off, and in Freihurg and Swansea is converted into sulphuric acid, so that the metals become oxides and sulphates. The temperature of the furnace is then raised, when the chlorine of the common salt forms volatile chlorides with zinc, antimony and iron, and affixed chloride with silver. During the roasting the ore is continually stirred until the chloride forms into coarse powder; it is then in a condition that the quicksilver will absorb it.

The only improvement ever made on the process for working silver ores has been made in the mechanical appliances for handling the ore automatically instead of hand labor, which has no connection with the chemical treatment. In California they use a cylinder furnace instead of a reverberatory one, which is constructed of cast iron, generally 30 feet in length, tapering from 50 to 40 inches in diameter. The furnace is made to revolve about four times a minute, the fire heating the furnace enters at the large end, and the ore, which is prepared precisely as above described, is fed into the small end of the furnace, and gradually passes toward the flame; a suction fan drives a current of air through the furnace with the flame. As the furnace revolves it raises the ore and showers it through the heat and oxygen at the same time, thus allowing the sulphur to pass off, and in this manner more thoroughly oxidizing, desulphurizing and chloridizing in one hour than in the reverberatory furnace in six hours. Gold ores are treated in the same manner and in the same furnace, excepting that salt is not used in the roasting.

The Amalgamation Process a Failure.

No one has ever made a success in treating gold sulphuret ores by amalgamation, and this is owing to the fact that all the sulphur cannot be driven off by roasting, and as long as any of the sulphur remains in the ore the gold will not amalgamate with the quicksilver. The sulphur can be driven off by the introduction of combustible gas into the furnace, which ignites with the sulphur, and will leave the ore thoroughly desulphurized. If the iron is thoroughly oxidized the gold can be amalgamated to a higher per cent., but this treatment, as used in California, was found to be more expensive than the chlorine process. They therefore make use of the latter.

Neither has anyone ever succeeded in amalgamating any of the rebellious silver ores which have been mentioned, except they first changed them from a sulphuret or sulphide to a chloride, and this can be done only with chlorine gas (formed from common salt) when the ore is at a proper state of heat.

The Robertson Process.

The Robertson process so-called was brought to my attention first in California about a year ago, and upon the request of some capitalists I examined it and failed to find any merit therein. Mr. Robertson claims to treat all rebellious gold and silver ores up to their fire assays at a cost not to exceed from $3 to $4 per ton. The treatment in question by which these wonderful results are obtained is, as I understand it, to first run the ore to be treated through an ordinary rock breaker, after which it is heated in a roasting furnace to a cherry red, when it is thrown into what he terms a chemical bath, which, it is claimed, oxidizes, desulphurizes and neutralizes it ready for the amalgamating pan.

The chemicals used in the preparation of this bath consist of one pound of cyanide of potassium, and one pound of sulphuret of copper, and ten pounds of common salt to a ton of ore. The cyanide of potassium is used for the purpose of keeping quicksilver clean by all mill men, and the sulphuret of copper is used by some amalgamators in working free silver ores. There is a difference of opinion among them as to its use. Some claim it is of no benefit to the amalgamation, while the contrary is claimed by others; but all metallurgists and mill men will agree with me in saying that neither of these chemicals has any immediate effect on ores, and any claim to the contrary cannot be substantiated by fair practical tests.

Common salt has a strong tendency to oxidize iron when brought in contact with that material and oxygen, but when in solution has no immediate effect upon any metal, and the roasting of the ores treated by the Robertson process is the most imperfect in use, and, as previously stated, a good result cannot be obtained by amalgamating gold sulphurets, except they are first thoroughly oxidized and desulphurized, and the Robertson process does neither; nor can be or any other "process man" amalgamate silver, except it is in the form of choride, horn silver, or native silver; nor will his process, or any other, change a sulphide or sulphuret of silver to a chloride in any other way than that which I have described. If it is a fact that man can not invent a perpetual motion in contradiction of nature's laws, it is equally true that, by the Robertson process, they cannot amalgamate rebellious gold and silver ores in violation of the laws of chemistry and of nature.

By the Robertson process they claim to have worked in quantity the rebellious ores of Meadow Lake, and to have obtained 90% of their assay value; but, from personal knowledge and late inquiries in California, I know that by it they have not worked *in quantity* these or any similar rebellious ores with success, but to the contrary; therefore, it is my opinion that this process cannot be made of practical benefit or profit as claimed.

Micro-Mineralogy.

At the last meeting of the San Francisco Microscopical Society, Melville Attwood, Esq., read a paper "On the impregnation of portions of the walls, or enclosing rocks of the Belvidere lode, Bodie, with native silver, electrum and cerargyrite." He said:

Since I had the honor of becoming a member of this society, now nearly eight years ago, most of my leisure time has been spent in the study of microlithology, and I have, during that period, cut and prepared for microscopical examination, a very large number of rock sections; but those marked Nos. 1, 2 and 3, which I now submit for your inspection, are, without exception, amongst the most beautiful and instructive that I have made.

The simple mode I use in cutting them, and which I had the pleasure of calling your attention to in my last communication to the society, I would also strongly recommend to the "geologist in the field." I found the great advantage of it in preparing these sections, as it enabled me to watch the operation very closely, to guard against making them too thin, as the character and beauty of the section would then have been destroyed.

The sections marked Nos. 1, 2 and 3, are cut from pieces of the wall, or enclosing rock (a much altered grayish-green trachytic diorite), of the Belvidere lode, taken at a depth of about 300 feet below the surface of the ground.

If they are examined by the aid of a good binocular, using a two-third objective and the paraholic illuminator, the native silver in leafy sheets, also the filiform particles of electrum, and grains of cerargyrite will be made to appear as if floating in a glassy and yellowish liquid mass. The cerargyrite grains are surrounded, or fringed, with native silver. The forms of some of the altered hornblende, of a yellowish color, are tolerably well preserved, while others show that they have been partially dissolved, and the spaces or cavities so formed, to a certain extent, replaced by silver, small grains of which are to be seen in both the altered crystals of feldspar and hornblende. Minute crystals of pyrites are also visible in the sections, and in the little cells left by the decomposition of some of the pyritic crystals are thread-like pieces of electrum. The impregnation of the country rock from which these sections were taken, I think, took place contemporaneously with the filling of the fissure.

The solutions from which the minerals of the Bodie lodes were precipitated must have been aqueous, otherwise it would be difficult to account for the presence of so large a portion of "wad" which is found mixed in with the vein-stone.

The grains of ore from impregnation are generally so minute that they cannot easily be recognized by the naked eye, so that under any circumstances they are better viewed by the aid of a good microscope.

The piece of quartz marked No. 4 is from the Belviders lode, and, if dipped in water and then examined with a good lens, the electrum, or Bodie gold, will be seen in beautiful thread-like particles throughout the whole mass.

No. 5 is a piece of "wad" from the Standard lode, Bodie.

Mr. Hanks made a very careful assay of the Bodie electrum, with the following results: Gold, 683.4; silver, 364.1; total, 997.5; specific gravity, 15.15; color, pale yellow, resembling German silver.

No. 6 is a section cut from rock taken from the 500 level of the Dudley mine, Bodie, the deepest in position, I think, on the Bodie metalliferous channel.

No. 7 is a section of rock from Gold Hill, taken from a point 60 feet west of the Comstock lode, and at a depth of 3,000 feet.

Mr. Frank Rutley, in his valuable little book on "The Study of Rocks," remarks: "There is, however, a disadvantage attending the use of lenses when they are applied to the examination of rocks. This lies in the difficulty experienced by the observer when he attempts to examine the streak of minerals under the lens, especially when the minerals occur in very minute crystals or patches, as it is scarcely possible to hold a specimen, with a lens over it in focus, in one hand and work with a knife in the other. Laying the specimen on the table, and using a lens in one hand and a knife in the other, is a most unsatisfactory process, while the use of a lens fixed on an adjusting stand is scarcely better. To obviate this difficulty, the author has devised a small lens with a clip which can be worn on the nose like an eye-glass, and both bands are then at liberty—the one to hold the specimen firmly, the other to use the knife or graver. Instead of a clip-lens, I use a watchmaker's eye-glass, fixed with a screw into a light pair of steel spectacle frames, the same as I send for your inspection. I think the botanist also will find it a very useful arrangement.

Mr. Hanks remarked that it was a mistake to suppose that a rock section must be cut so thin as to be wholly transparent. In some cases this is necessary; but, as a general rule, the section should be left as thick as possible, and strongly lighted by the aid of paraholic reflector. The beauty of many specimens is destroyed in the effort made to fit them for observation by simple transmitted light.

Mr. Atwood's plan, to cement the section to a glass slide, and to examine it from time to time under the microscope as the work progresses, is very important, as it will enable the student to stop at the exact point when light can be passed through it, but before many of the most interesting features are destroyed by over-cutting.

MINARET DISTRICT is situated six miles north adjoining this district, and is so called from its proximity to the famous peaks of that name which rise immediately to the north of it, and whose cathedral-like spires stand out in bold relief and form a prominent land-mark from the eastern and western sides of the Sierra Nevadas. This curious freak of nature, as well as glacier mountains a little further to the north, are yearly visited by many of the curiosity-hunters and men of letters from the scientific institutions of this country and Europe, who, after paying a visit to the big trees of Mariposa and the grand scenery of the Yosemite Valley, rarely fail to climb to the top of the snowy mountains that they may enjoy the majestic view. The Minaret mines were discovered about two years ago. The ledges are very large and traceable for a considerable distance. The ore found is of fair average quality; wood in abundance, and water sufficient for milling purposes in the close neighborhood of the mines, which are found on the Summit dividing the main branch of the San Joaquin and Murderer's (or Deadman's) fork of Owens river. The ledges are found on both the eastern and western slope of the mountain. The ascent from the eastern side is gradual, and an almost natural road to the summit has been found, which with but little work, can be made available for wagons. From the western side, however, it is very steep, but the trail up the mountain is short, and pack and saddle horses have no trouble in making the ascent. The distance from Lake by the western road is about twelve miles, and by the trail on the eastern side six miles from the Mammoth mill.—*Mammoth City (Cal.) Herald.*

GOLD.—Three gold bars from the Smartsville hydraulic claims have lately been shipped to an assay establishment in San Francisco. Two of the bars weighed respectively $29,600 and $18,000.

THE water is so strong on the 2400 level of the middle mines—Chollar, Hale & Norcross and Savage—that work in the several drifts at that depth cannot be resumed.

WATER has been struck on the Colorado desert at a depth of 280 feet, and is pure and free from alkali.

MECHANICAL PROGRESS.

Locomotive Boilers—Iron vs. Steel.

For years past, a committee of the Master Mechanics' Associatien has been investigatiug the gcaeral subject of locomotive boiler construction, with respect to methods, forms, proportions, materials, etc. The reports submitted from year to year contain a great deal of interesting information upon all these points, hut without settling very conclusively any one of them. Ia regard to the best material for the shell and fire-boxes, it is important to determine the respcctive merits of stoel aad iron; but the evidenee in this particular, as contaiued in the committee's report made last year, is somewhat bewilderiag. Boilers msde of each material corroded, pitted and furrowed very nnequally, the results heing diametrically opposite on different roads and in different localities. Mr. Hayes of the Illaois Ceatral, has several eagines, tho hoiler shells of which are made of Low-Moor iron. They have been in service 23 years, with but little siga of corrosion or pitting in the sheets, those in the hottom of the boiler having never been ronewed, aad heing to all appearance in good conditioa. In 1874, he hnilt two new engines, the hoiler shell of one being of a high grade of steel, and the other of iron. Both were put in the same service, on the same section of the road, and made equal mileage. The steel boiler suffered most from corrosion and pitting, while the iron one was but slightly corroded. Another "open hearth" steel hoiler, built in 1876, showed similar results; in fact, all the steel hoilers built by the company within a period of five years pitted and corroded worse than the iron ones.

In marked contrast with this experience, Mr. J. M. Boone, of the western division of the Pittshurg, Fort Wayne & Chicago road, holds that steel is the hest material for boilers, with either coal or wood as fuel. His first steel hoilers were huilt ia 1871, and there had heen no pitting, furrowiag or corroding inside of them; whilo iron hoilers of the same size, performing the same service and using the same water, corroded so badly in six years, that the sheets had to ho renewed. Mr. Sedgely, of the Lake Shore road, gives similar testimony in favor of steel. Mr. Fuller, of the Atlantic & Great Western, bad also obtained the hest results from steel, although tho boilers made of it were not entirely free from furrowing. The fire-boxes also furrowed on top of mnd-ring, especially when lime water was nsed.

Various theories are advanced to account for these contradictory results, the most plausible of which relate to the impurities in the water used; lime watsr having a more injurious effect, apparently, upon steel crown-sheets than npon iron. Furrowing, according to the report, at seams, curves and where braces are attached, is easily accounted for, hut pitting occurs at nnlooked-for places; is a serious difficulty on some roads and on otbers is scarcely known. The particular cause of it is unknown aad also the remedy.—*National Car-builder.*

NAPTHA AS FUEL FOR LOCOMOTIVES.—An experimental test of the Holland hydrocarhon retort, for generating steam on locomotives, bas recently heen made on the Long Islaad railroad. The grato-bars of an ordinary engine were taken out and the retort put in their place, containing four compartments, two for water and two for oil. A tank of naptha was placed in the tender and connected with the retort by gas pipes. An almost pure hydrogen gas is generated in the retort, whicb produces an intense heat and no smoke. The trial was very successful, although made nnder certain unavoidable disadvaatages. The cost of the oil consumed was nine cents for six miles, the crude naptha costing three cents per gallon. The experiment was witnessed by a large number of merchants and scientific men, who tendered the inventor, Dr. Holland, a vote of thanks.

A REMARKABLE PLOW.—A Chicago agricultural journal gives an account of the largest plow ever known to he made, whicb has heen recently turned out by an Illinois firm of agricultural machinery makers for use on the St. Louis, Iron Mountain and Southern Railway. It is attached to a platform bar of a construction chain in sucb a way as to cut its ditcb a sufficient distance from the railway line. It will make one mile of ditch, 2 feet deep and 3 feet wide, every 4 hours, thus doing the work of about 1,000 men. The beam is made of swamp oak, and is 8 inches hy 4 inches, the land side heiag made of bar iron 8 inches wide and 1½ inch thick, which bad to be forged expressly for the purpose. Its total weight is 1,700 lbs.

A NEW BOOT SOLE.—A Chicago boet manufacturer, Mr. Goodrich, has introduced what he is pleased to call an indestructihle sole, in whicb nickel-plated stecl rivets are embedded ia the leather. These rivets are forced through perforations from the inside of the sole to its outer surface, and being less in length than the tbickness of the leather, the head ie securely emhedded, and does not drop out as the sole hecomes worn. Owing to the nickel-plating, it is claimed there is an entire absence of rust.

TO ASCERTAIN THE SIZE OF THE DRIVER.—Multiply the diameter of the driven by the nnmher of revolutione you wish it to make, and divide the product by the revolutions of the driver; the quotient will he the size of the driver.

Friction and Traction.

Every mechanic knows that friction is the resistance produced by the rubbing of the surfaces of two solid bodies against each other. Perhaps a better dcfinition is "the resistance which the surface of one body presents to the motion of that of another when in close contact." So much depends on the knowledge of these priaciples in the operation of modorn machiaery, that an explaaatiou thereof mnst he admitted to constitute an ossential item in an illustration of the first principles of the scieace of mecbanics. Traction consists of the same resistanco which produces friction. In mechanics, the angle of traction is the augle which the direction of the power makes with a given plane. Tractioa implies the same resistance as frictioa, but in such a degree as to prevent any motiou of the second surface on the first.

The resistance of friction is produced hy a minute roughaess of the surfaces, wherehy the projectiag points of one surface take hold of those of the other; on this aceount, the resistance is found to he greater hetween two surfaces of equal metals or materials than hy those of diverse articles. The friction between two pieces of iroa, or two pieces of hrass, is greater than that between iron and hrass. No metallic substance cau he sufficiently polished to prevent this resistance; for although the roughness of the suhstaace may not be palpahle or visible, yet it evidently does exist in the smoothest metallic suhstaaces. To avoid, as much as possihlo, this resistance, machiaists and millwrights have adopted the practico of making pivot hoxes of a different materisl from that of pivots or gudgeons of machincry, sad of oiling the surfaces of the parts of machinery that are exposed to friction, thus filliag the cavities and preventing the actual contact of the surfaces.

The resistance of friction is, in some measure, proportionate to the force with wbicb the two surfaces are pressed together; it also depsnds, in some measure, on the extent of the surfaces whicb come in contact; but it has hesn proved hy expsriment that the resistaace of friction is increased very little, if any, by the increased velocity in moving surfaces; hence it is advisable to use as small pivots as are consistent with safety with regard to strengtb. Traction is a word which has heen in use only since the iatroduction of locomotives. When steam power was first iutroduced on railroads, considerable douht and anxiety prevailed on this subject, and various plaus were invented and patented for preventing the engine wheels from sliding on the rails; but all these inventions have been rendered useless hy the development of the important fact that the puhlic bas uo occasion for them.—*Millers' Journal.*

NEW USE FOR SAWDUST.—Sawdust can be converted into a liquid wood, and afterwards into a solid, flexible, and almost indestructihle mass, whicb when incorporated with animal matter, rolled and dried, can be nsed for the most delicate impressions, as well as for the formation of solid and durahle articles, in the following manner: Immerse the dust of any kind of wood in diluted sulphuric acid, sufficiently strong to affect the fibers, for some days; the finer parts are then passed through a sieve, well stirred and allowed to settle. Drain the liquid from the sediment, and mix the latter with a proportionate quantity of animal offal, similar to that used for glue. Roll the mass, pack it in molds and allow it to dry.

FALL OF A METALLIC ROOF.—On a cold nigbt of last Decemher, when the thermometer stood at 5° Fahr., the metallic roof of St. Martin market, Paris, suddenly fell. It was huilt upen rigid supports and seems to bave been sufficiently stroag. The cause of the fall was therefore a mystery, and the Frencb engineers are discussing the subject with mucb interest. They very geuerally agree in regarding the rigidity of tbe supports as a defect, and in thinkiag that the extremities of every heam should be allowed sufficient lateral play to prevent any injurious effect, either from contraction by cold or from expansion hy heat.

AMERICAN MACHINERY IN ENGLAND.—American machinery for the manufacture of shears has lately been introduced into Sheffield by the manufacturers, to the great dismay, it is said, of the operatives, who, up to the present time, have had tbe reputation of being the most arrogant of strikers. The forging and grinding machines introduced are reported to he giving the most complete satisfaction, and, now that they have been introduced, will no doubt contrihute materially to the settlement of labor trouhles.

TO DETECT AN UNSOUND WELD.—If a piece of iron appears to have an unsound weld, or if it has a crack apparent upon the surface and it is desired to know how deeply it penetrates, beat the part to he tested to a red heat and pour a fine stream of watsr upon the faulty spot, but mainly on one side of it, and the iron on that side will lose its redness more rapidly than the other side, and plainly indicates how deeply tbe fault extends.

TO FIND THE HEATING SURFACE OF CYLINDER BOILERS.—Multiply two-thirde of the circumference of tbe shell in inches by its lengtb in inches; add to tbis product the arsa of one head if exposed to tbo action of hot gases, and divide by 144. Tbe quotient will he the numher of square feet of beating surface.

SCIENTIFIC PROGRESS.

Theory of Light and Color.

Prof. Tyndall recsntly gave at the Royal Institution, the first of a course of six lectures on "The Theories of Light and Color." A good deal regardiag light was, he ssid, known to the ancients. They knew the law of reflection and somethiug of that of refraction, as shown hy ths refereuce of Seneca to the hroken appsarance of an oar when thrust into the water. Another phenomenon, that of tho raiuhow, standiug out in the sky as a sort of challenge to the human eye, could not escape detection. At one particular aagle, as shown hy Descartes, heams reflected hy or emergiug from a drop of rain were so welded together as to form a condensed sheath of rays, aad it was in this condensed sheath tbat you saw the colors of the rainhow. Milten, in 1672, proved by the use of tho prism acted on by a heam of light thrown throngh an aperture in a window shutter into a dark room that white light is not homogeneal, hut is composed of various coastituents more or less refrangible, of which red is the least and violet the most refraagible. This premiscd, Prof. Tyndall, hy a series of heautiful and interesting experimcnts from apparatus managed hy his assistant, threw upon a whito screen disc of several colors in order to prove tho true effect of intermixture. Thus the ordinarily received theory that comhiaation of yellow and hlue produces green was sbown to he erroneous, the true effect of the comhination of those two colors heing, as proved to ocular demonstration, white. By the same means the true complementary colors were displayed. Fixing tbe eye on a white disc nntil the lecturer counted 20, and the special illumination of the disc was withdrawn, the spectator saw remaining the filmy semhlance of the complementary color, black. Blue left orange, red left greea.

THE NATURE OF LIGHT AND ITS ACTION UPON THE EYE.—At a recent meeting of tbe Buffalo Microscopical Club, Dr. Lucien Howe presented the suhject of the undulations of light and their perceptions hy the eye. Brief mention was made of the diffsrent theoriss, accounting for the pbenomena of optics previous to the present century. Tbe difficulties of this subject were first solved by Thomas Young, wbo satisfactorily explained tbe undulatory theory of light. He showed that what we call light is impression produced upon tbe retina by tbe wave-like motion of the particles of matter. Subsequently the lengths of these waves were measured. It would take 36,918 waves of red light, or 64,631 waves of violet ligbt, placed end to end, to make an inch. From the speed of light, wbicb has been measured, it is proved that at least four huudred and fifty one millions of millions of these minute waves flow into the eye and dasb against tbe retina in eacb second. Dr. Howe proceeded witb a minute description of the microscopical anatomy of the eye, more particularly relating to tbe "layer of rods and cones." These were stated as heing in reality tbe terminal filaments of the optic nerve. Tbese are shaken or acted on by the waves of ligbt, and it is especially tbese witb wbich we see.

CALORIFIC EFFECT OF STEAM BOILERS.—Scheurer-Kestner estimates tbe loss of beat from the fire of a steam boiler, by radiation and conduction, at 25.5%. Some writers say 40%. As tbe loss bas never heen directly determined, but only estimated from the differences between other data wbich were imperfectly ascertained, these figures are very problematical. Ferdinand Fischer suggests experiments with combustibles of uniform composition, sucb as illuminating gas or petroleum, for determining calorific values and tbe various losses of heat. By adding the quantity of gas set free by comhustion and elevated temperature, and taking account, by tbe belp of Linde's formulas, of the specific beat wbich varies witb the temperature, it would he pessible to reach an accurate knowledge of the amount of heat transmitted through the metal to the water of the boiler.—*Dingler's Journal.*

TEMPERATURE OF DEEP WATER.—F. A. Forel has made a series of observations on the Swiss lakes, similar to that of Buchanan at Loch Lomond. He finds that the limit of tbe superficial chill is mucb greater than has been hitherto supposed, extending in some cases even to the depth of 110 meters (120.3 yards). The penetration of the cold into the upper layers take place very gradually and progressively. It dees not appear to he accomplished either hy convection or by mechanical mixture under the action of waves and currents, hut may perhaps be connected with conductihility and radiation. Observations extended over an interval of 40 days showed a great uniformity of temperature, hut at no time was the uniformity complete throughout tbe whole depth of the lakes.—*Comptes Rendus.*

A SCIENTIFIC NOVELTY.—At tbe recent annual meeting of the Paris Physical Society, wbich took place on April 2d, in the hall of the *Societe d'Encouragement*, a numher of novelties were presented. Amoug them was a most curious experiment with M. Trouve's *polyscope*. This *savant* is reportsd to bave "placed hie electrical polyscope in the stomacb of a fisb swimming in an aquarium, and, without its seeming to euffer any inconvenience, it radiated a light equal to one candle."

WHITE FISH UNDER THE MICROSCOPE.—At a recent meeting of the Griffith Club of Microscopy (Detroit), Mr. J. C. Holmes, assisted by D. J. McGuire, M. D., gave a demonstration of the circulation of hlood, illustrated by young whitefish from the Detroit "hatchery." The young fish, less than a week old, and looking not ualike a pair of eyes propelled about hy an exceediugly active tail, were found, under the microscope, to bs possessed of all necessary "interior" arrangements. As they are nearly as transpareut as glass, the action of the heart in receiving and propelliag blood, and the stream of hlood corpuscles down oae side to the tail, and back on the other, could he distinctly scen and examined. The whitefish that are caught for this market are largely made to recoguize their ohligation to posterity, hy passing through the "hatchery," where the *modus operandi*, as described by Mr. Holmes, is as follows: The eggs are stripped from the females by pressing the sides with the hands, and deposited in a large tin pan partly filled with cold water. Into this are placed two or three drops of milt, which is ohtained by a similar process from one of the male fishes, and which coutains the male principle of life—the microscopical spermatozoa. Each drop of the milt contains several thousands of these minnte organisms, that would remain undeveloped hut for the favorahle conditions found in the female egg. These spermatozoa penetrate the eggs, and curling themselves up comfortably await the necessary five months to incuhate. It is now the hatching season, and the unhatched eggs ressmble a small pea, of a nearly transparent color, but with two distinct hlack dots on one side, which the microscope shows to he the eyes of the fisb.

PHOTOGRAPHY UNDER WATER.—Wm. Morris, of Greenock, says the Glasgow *News*, has made a discovery hy which he can photograph undcrneath the water at a depth of 10 fathoms. Two of the negatives he has sccured are remarkably distinct, hut the others are rather dim owing to defects in tbe apparatus, whicb be hopes to remedy. Tho camera is inclosed in a watertight glass case, suspended by the center and enclosed by a cover, that is drawn off after the camera—whicb is fixed on a loaded triped—has reacbed its position. One of the views taken in the bay, shows a sandy hottom, witb a number of large boulders covered with seaweed, and an old anchor; and, in the shade, three mooring cables belonging to small yacbts close at hand. When the weather calms down and the light hecomes stronger, Mr. Morris intends to carry out his investigations witb improved apparatus, when be expects to achieve still greater results.

MAGNETIC WRITING.—Prof. Thompson, of Bristol, bas lately made an interesting observation in regard to an application of magnetism. He takes a thin plate of hardened stcel and writes upon it witb a magnetized iron style, tbus communicating a tolerahly permanent magnetism to the parts of tbe plate which are covered hy tbe writing. If fine iron filings are sprinkled upon tbe plate and the plate is then held perpendicular, so as to remove the loose filings, tbe writing becomes visihle upon the magnetized portion. The experiment may be repeated, at pleasure, for an indefinite period.—*Fortsch. der. Zeit.*

KEEPING WET PHOTOGRAPHIC PLATES FROM DRYING.—As dry plates are not always obtainable, and ordinary wet plates dry so quickly as not to allow transporting, it often becomes necessary, in order to make a single picture, to carry as mucb apparatus as would he required to make a dozen or more. A very good metbod of preparing a wet plate so as to last for several bours consists in flowing tbe plate (after taking out of the hath) witb a mixture of one part of strong solution of silver (80 grains to an ounce), and two parts chemically pure glycerine. Flow and drain tbe plate until all streaks disappear and the plate remains smootb.

TOUGHENED GLASS FOR LEYDEN JARS.—It bas heen found by M. Ducretet that "toughened" glass oppeses mucb greater resistance to tbe passage of electricity tban ordinary glass, and, consequently, wben employed for leyden jars, is capable of receiving without being fractured, a much stronger charge of electricity. This fact may he of great importance, as leading to tbe construction of extremely thin condensers, capable of giving great effects. Plates of toughened glass can he employed in tbe same manner.

NEW ELECTRO-MAGNET.—Chambrier increases the powsr of electro-magnets hy increasing the extent of active surface at the extremity of tbe core and of tbe oscillating armature. This be does hy various methods. He hollows the core and gives to the armature a projection fitting into the cavity; or he attaches the projsction to the core, making it fit a cavity of the armature, etc. All of his methods are nearly equivalent in effect.

THE FORMATION OF DELTAS.—Devon thinks tbat too little attention is paid to making a proper distinction hetween torrential deltas and the deltas of large rivers. He believes that this distinction is as important in all cases as that which has heen estahlished hetween marine and lacustrine deltas.

ELASTICITY OF CHROME STEEL.—In his experiments upon tbe hydrodynamometer, Pellot found that the elastic resistance of chrome steel could he pushed to a much higher figure than that of any other metal which he tried, without passing tbe limit of elasticity.

The Mining Share Market.

The sudden advance in the prices of miuing shares which took place as onr last issue went to press continued to increase toward the end of the week, when a considerable reaction set in. As no apparent development in the mines serves as a basis for tbis sudden improvement in the market, there is mueh reason to believe that the present appreciation is phenomenal. Those at all familiar with such matters know that stocks have periodical freaks, and at times fluctuate greatly at variance with the real value of what may be represented. The market often becomes depressed, and prices fall to a figure that may be much below the real value of the stocks, after which they will rise to a figure mnch beyond the real value. In this recent boom those who got in at the low prices hastened to realize on quick returns and small profits, the particnlar merits of the mines not being taken into consideration, the selection of the stock, in great part, depending merely on the inclination of the purchaser. A strike, however, is reported from the New York mine, in the north drift on the 1600 level, yielding ore assays which show a good prospect for the mine, though big bonauzas are not expected now so much as formerly; people are growing more moderate in their mining desires; hence, small but paying mines on or off the Comstock are now and will in future command attention from investors. As before stated the recently inaugurated movement has for its basis, more a concentration of shares than any development in the mines, and for this cause its duration is likely to be short, resulting in a more extended demoralized feeling than existed before its inception. There are some favorable accounts from parts of the Comstock, but not so exceedingly eneouraging as to justify much higher prices for shares than existed abont one week ago.

A BILL has been introduced in the U. S. Senate to allow the construction, by tho Occidental and Oriental Steamship Co., of a railroad from Green River station on the Union Pacific railroad, to Steilacoom on Puget sound, W. T.

Superintendent's Statements.

Under the Felton act passed by the State Legislature, the superintendents of mining companies, which are incorporated under the laws of this State, must furnish weekly statements under oath, of the progress and development, number of men employed, bullion on hand, etc. From onr mining summary it will be seen that the Comstock superintendents this week began to furnish their statements as required by law. Some of them grumble at the trouble, but as blanks are provided which they fill out, they will soon find it no more trouble than the usual weekly letters.

The public, however, will feel much more confidence in these reports of superintendents than formerly. Under the circumstances they will he extremely careful that no loose statements creep in, and they will not want to swear to statements which other people prepare for them.

Altogether, it seems as if the system would be beneficial in the end. If penple incorporate mines and sell the stock to the public that public has a right to know something about the mine. Until of late they didn't know anything about it unless they had a large "block" of stock, or were on the hoard of directors. The directors "run" the mine in their own interests without the slightest regard to the other stockholders. All this has been douc so often that it has become played out. It was really this feature which has damaged the mining interests so much on this eoast. If at all times stockholders could know the real—not tbe apparent—truth about their properties, it would he better for them and better for the general mining interests. Snperintendents, with the general welfare nf the companies they represent at heart, should rather rejoice that under the new regime snspicion should be lifted from their shoulders as directors, and while they might desire a "coloring" to be given to a letter, could expect nothing nf the kind in a sworn statement.

WORK on the artesian well at Modesto has been suspended. The depth of 1,045 feet was reached.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALAMEDA.

NEW GOLD MINES.—Oakland *Tribune*, May 14: Active preparations are going on for the early working of the gold-bearing quartz ledge recently discovered in the San Pablo range. A blast furnace has been sent out, a camp established, and a mill will soon be erected. The new mining district has been legally organized under the name of the Blue Bell district. It lies on the boundary between Alameda and Contra Costa counties, extending five miles east from said line, its northwestern initial point being at the crossing of the old Martinez road.

AMADOR.

QUARTZ DISCOVERY.—Amador *Ledger*, May 15: Olcta is enjoying a little furore, over the discovery of a new quartz ledge, on Uhlinger's ranch, a short distance from town. We have not heard the size of the vein. Samples of the rock exhibited in Olcta are very rich, and would yield per ton away up in the hundreds of dollars.

ITEMS.—A new shaft, 15 ft in the clear, is to be sunk on the Oaks mine, to the depth of 1,300 ft. The Elephant mine, a mile south of Plymeuth, on the north side of Dry creek, has the appearance of a permanent mine. A large body of quartz crops out on the surface, measuring over 20 ft in width. A shaft is being sunk on the footwall. D. D. Reaves is one of the owners.

A GREAT ENTERPRISE.—The Directors of the Pacific mining company, whose location adjoins the Empire mine, were here and busy all the week in arranging surveys, etc., for the commencement of a shaft upon the ground, and we are informed by responsible parties that ground will be broken next Tuesday for a vertical shaft, to be sunk to the depth of 1,300 ft, before they tap the vein. Heavy machinery will bo placed upon the ground immediately, and work commenced. The company has also laid out a mill site, and expect to bave an 80-stamp mill ready by the time the shaft is completed. This immense enterprise is not on spekulation, for the Empire company has worked up close to the line of this location to the depth of 1,300 ft, and they well knew the immense body of rich ore that waits the signal to bring it from its buried depths. This is by far the largest mining enterprise ever inaugurated in the county, and we wish it great success, as it will directly and indirectly give employment to hundreds of laborers.

BUTTE.

BUTTE HYDRAULIC MINE.—Oroville *Mercury*, May 12: Superintendent Rhodes returned from San Francisco, Tuesday, whither he went Saturday. The flumes and riffles are already to be placed in position, but the present high water prevents operations for the time being. A small clean-up was made last week. The result was very favorable and the prospects of the property are better than ever.

CALAVERAS.

THE GRAVEL MINES.—Calaveras *Chronicle*, May 15: Great activity prevails at present in the gravel mines in this vicinity. The ditch is running full to the brim, the weather bas moderated and everything is favorable to a vigorous prosecution of operations. At Duryea's, the Mammoth, the Bonauza, the Penobscot, the Maison de Sante and Eureka hydraulics work is being pressed forward with full forces of hands and an abundant water supply. The tunnel claims are also being steadily worked, prominent among wbich are the Green Mountain, La Belle France, Rough Diamond and others. Generally speaking, results are fair, and as the water supply promises to continue abundant until late in the season, we think we are safe in predicting an unusually prosperous year for the mining fraternity.

MILL AT THE BOSTON.—We learn that the speedy construction of a fine 20-stamp mill on the well-known Boston quartz mine, in Buckeye gulch, is contemplated. In fact we understand that the lumber is already ordered and the contract let for building it. Mr. John Rider has been employed to superintend the construction. With the aid of a good mill, there is a strong probability that the Boston will develop into a first-class mining property.

CARSON HILL MINES.—Cor. Calaveras *Citizen*, May 15: Carson hill has one of the richest mines in California. Thousands of dollars have been extracted from the mine since its discovery, and yet there never was a mill on it. The present company is now sinking a shaft below the level of their tunnel; they are down to the depth of 70 ft, and intend to sink 80 ft more. The Union mine is still idle, having been bonded several times, but with poor success. The Vanderbilt mine, owing to the wet weather has been lying idle. The company, which consists of farmers living in Modesto, will shortly commence work in earnest to develop the mine. They have a fine prospect and well-defined ledge. A number of smaller mines are being worked with good results. From present appearances, there will be considerable mining done in this county during the summer.

SHEEP RANCH ITEMS.—The Lost Boy mine will resume operations soon. Preparations are now being made. The mill of the Hagin mine was started on Monday morning last. Work was also resumed in the mine. The coming summer will undoubtedly be a lively season to our burg. Prospecting will be resumed by many, and we have reason to believe that several remunerative veins of quartz will be opened. E. Bean and N. Barrow have discovered a lode recently, which prospects favorable. The claim is located on the San Antone creek, near the new road to Murphys.

EL DORADO.

THE GOPHER MINE.—*Mountain Democrat*, May 15: John Sipp, who has a bond of the Gopher and Boulder mines, in Kelsey district, was over to Placerville last week, having just completed a crushing of a considerable quantity of surface rock from the Gopher mine, which netted him a little over $12 per ton. Having freed the shaft of water, he is now taking out rock from the bottom, which will average at least $25 per ton, and for which responsible party has offered him $15 a ton as it lies on the dump. The Gopher is a well-defined ledge at least 4 ft in thickness, and can be tapped at a depth of 350 ft by a tunnel of 300 ft from Irish creek. Thousands of tons of quartz from these 2 contiguous monster ledges—the Gopher and Boulder—can be mined and milled at a very low cost; it certainly will not cost more than $5 a ton, and probably not more than $3, and the natural facilities for extracting a large amount could hardly be improved.

THE DIAMOND SPRINGS HILL MINE.—Hon. S. S. Tilton, of San Francisco, was in town Thursday, having come up for the purpose of inspecting the immense gravel deposit at Diamond Springs, and he thinks he has devised a plan by which it can be worked to advantage. The gold is there if a plan can be discovered for getting it out.

GOOD DUST PURCHASES.—Among other signs of business prosperity and by no means the least significant, is the fact that the purchases of gold dust by our merchant and bankers are exceeding those of any previous period for many years. If we had permission to publish the amount purchased by one house in Placerville between April 10th and May 10th, the figures would very agreeably surprise our readers. They are "away up," and closely approximate the bigbest figures of the "flush times." And this although our mining industries are but beginning to thaw out after an unprecedentedly hard winter. For the forty-eleventh time we repeat our prognostication that the boom is nearly upon us, and "don't you forget it."

MONO.

CERRO GORDO.—Bodie *News*, May 15: The mining prospect at this old and well-known mining camp is good and gives promise of quite a boom the coming season. Messrs. M. C. Hawley & Co., of San Francisco, are now building a new quartz mill at Owens lake, and when complete

e mines will be started at full blast. This will give re-wed impetus to the opening up of many valuable min-g properties, and we may soon expect to hear of the l-time prosperity of that camp.

THOMA CON.—Bodie *Free Press*, May 16: A drift north the vein is now 5 ft. between the walls. The footwall rries a heavy seam of clay, and the quartz in the center very rich. Superintendent Golding considers this a ry important development. The prospects for the vein open out into a large body of ore are very flattering, d the future of the mine is assured beyond a doubt. he west crosscut, 800 level, was only extended 13 ft rce last report. All is now secure and in good shape. e Syndicate tunnel was timbered a distance of 40 ft ring the week.

BONANZA IN THE ORO.—Since the revival of mining erations in the Bodie district in 1877 Silver Hill, the at eminence south of High Peak, has been an enigma, the solution of which the best energies of some of our st enterprising mining men, and thousands of dollars money, have been directed. The richest placer mines this section are found on either side of that hill, and ny other circumstances have extended the most ex-vagant promises of a rich reward for these labors, but till the past winter the destiny of Silver Hill has re-ained undetermined. During the past 2 or 3 months it been known, however, that discoveries of considerable portance had been made in at least two mines on that ll, one of which is the Oro. Mr. Thomas Steel, the perintendent, has been pushing the work of develop-nt with vigor, and having opened up the mine to a fficient extent to present to public inspection, yester-y invited a number of gentlemen to take a look through e workings. The first level is at a depth of 230 ft from e surface, and on a plane with the Silver Hill tunnel, oed by the same people as the Oro, and with which it ll eventually be connected. The work on this level nsists in a crosscut west 357 ft and east 188 ft. Seventy-e ft from the shaft in the west crosscut the Walter ige was intersected. This ledge where cut is 16 ft in ith. The second level is at a depth of 340 ft. Here Walter ledge was cut 25 ft west of the shaft. It was about the same width as on the level above, but proved incalculably as to quality. Next to the clay ing on the hanging wall side are several layers of utiful ruby silver quartz, the ruby showing all through e splashes of blood. The shaft is now 400 ft deep, and being continued down. A visit to the bottom disclosed e fact that it was passing through the ledge, and yester-y the full 8 or 9 ft of excavation at the bottom was in e. It is generally known that the Walter ledge was cut a west crosscut, 675 ft in length, from the Maybelle ne, and that the outcrop of the vein was within the ria ground, lying west of the Oro.

EVADA.

A LEDGE THAT IS EASILY WORKED.—Nevada City *Tran-ript*, May 14: About 3 years ago, Frank Souchet located old-bearing ledge lying 1½ miles northeast of North oomfield, and adjoining the Mount Blanc claim. He a tunnel to tap it, but owing to the lack of timbering e workings caved in. He next constructed a ditch and ound sluiced. Thus the ledge, which averages some 8 in thickness, was opened for a space about 100 ft wide d 75 ft deep. It is estimated that the amount of ore ow in sight is 2,000 tons, and the owner says it can be ucked out and hauled to the mill site for 50 cents a ton. has prospected it in numerous places and found every-ere enough gold to satisfy him that it is good milling . Five tons of it is being extracted at present and will brought to this city and worked as soon as the roads e tle. Mr. Souchet's location consists of 3,000 ft on the dge, and his claims are termed the Bunker Hill and ichmond. The property includes a water right that es 200 ft pressure, and considerable heavy timber.

SANDERS & JACOBS' MINES.—The Sargent & Jacobs roperties at Quaker hill are in a prosperous condition. ere are 20 men employed in the drift mine. Monday a nnel 20 ft below the upper one was started. The daily tput of gravel is about 50 tons. This is breasted out, ted through the shaft, crushed and the whole process working gone through with at a cost of about $1.50 a . In spots the cement has paid as high as 25 cents a und, and the general average has been of a satisfactory aracter. It is believed that the new drift will disclose ch richer gravel than does the one 20 ft above, as the ter evidently extends along a bench or bar in the dead er. The machinery is all run by water. There are 3 rdy wheels—1 for the mill, 1 for hoisting and 1 for mping; all but the latter are stopped Sundays, when e employees take a Christian-like rest. The company's draulic mine, close by, also keeps about 20 men busy. ere are 2 monitors in use. Operations are not sus-nded here at any time, as even an hour's delay would rmit much water to run to waste. Some trouble has en experienced by a slide in the road that prevents tim-r being readily hauled to the working.

THE IRON CLAD MINE.—Nevada City *Transcript*, May : The Iron Clad mine is situated 1 mile south of Rough d Ready. Under the management of Mr. Cammet it become well known throughout Nevada county. The aft is down about 150 ft, and has a well-developed and ineral ledge between 2 and 3 ft wide, running northeast d southwest. The company has let a contract to sink ft more. They intend at the completion of the con-act to run drifts and cut the adjoining ledge, which runs arallel with the main ledge. The rock taken out says for e sinking. We were shown pieces of quartz weighing tween 40 and 50 pounds, in which free gold could be ite readily seen. There is a 5-stamp mill on the mine. he intention is to erect 25 stamps more this summer. here is also a patent furnace for roasting sulphurets. he rock is paying $30 and $40 per ton. Mr. Cammet has en at work over 2 years in developing this mine, and has ent a great deal of money, and at last his efforts are owned with success.

A NEW MINE.—James Spargo a few weeks since located ledge lying between the Providence and Black Prince laims, striking good ore at the grass roots. He finally ent down the hill where he started a tunnel. After run-ng about 6 ft, the ledge was found to average from 18 to 0 inches thick, and a well-posted, practical miner work-g in that vicinity says the ore is literally filled with old. There are at present 3 men working in the claim, nd another shift is to be put on soon. A 4-stamp mill as been procured, and is being erected. The mill will be un by water power. Several men employed along the reek say they believe Spargo's strike is one of the best ver made in that part of the district.

THE FORTUNA MINE.—The building over the hoisting orks of the Fortuna mine had advanced to a stage of ompletion last night that will insure against further de-ays in progress by bad weather. This week steam will be tarted. After the water has been pumped out, the shaft, hich has a depth of 130 ft, to which point it was sunk y the former owners, will be pushed down 70 ft further, here the first drifts will be run. While ore is being aken from the 200 level, another level 100 ft lower will be unk for.

TUOLUMNE.

MINES SOLD.—*Union-Democrat*, May 13: Three quartz ines were sold last Wednesday to the Boston, Pacific ining and investment company. The Evans mine, 0 iles above Sonora, the Hazel Dell, adjoining the Evans, nd the Mastodon, near Cherokee, were the properties isposed of. The parties representing the company, hrough whom the purchases were made, were Thomas B. owns, Vice-President, and Major David T. Bunker. These entlemen state that it is the intention of the corporation o carry on a heavy business in this line on this coast, pay-ng particular attention to the mining interests of Tuol-umno county.

NEVADA.

WASHOE DISTRICT.

INSTEAD of writing the usual weekly letters on the ines, the Superintendents made out, for the week end-ng May 15th, the "sworn statements," which are required nder tha new California law. The "sworn statements" are principally in tabular form—printed blanks that are filled out with figures representing the number of ft that the several drifts, crosscuts, winzes and other openings have been advanced during the past week. Instead of giving our usual "summary" this week, we give the state-ments, since they will show number of men employed, ete.:

UTAH.—Miners, 39; surface men, 0; engineers, 3. South drift, 1750 level, extended 20 ft; total length, 430 ft. East crosscut No. 2 extended 16 ft; total length, 76 ft. Main incline sunk 12 ft; total length below the 1950 level, 76 ft.

SIERRA NEVADA.—Miners at work, 130; engineers, 7; firemen, 3. West crosscut on the 2300 level advanced 30 ft during the week. North drift on 2400 level advanced 45 ft; east crosscut from east winze advanced 12 ft. The station for the hoisting engine to hoist from the 2500 level has been completed. Station on the 2400 level, at east winze, retimbered.

UNION SHAFT.—Miners at work, 104; surface men, 83. Sinking the shaft has been resumed; are cutting out bob-pit at 2400 level, easing timbers and repairing hoisting engine.

UNION CON.—Miners at work, 153; surface men, 9. Ore is being extracted on the 2300 and 2400 levels. No. 2 winze, 2400 level, sunk 6 ft. Northwest drift on the 2500 level, from No. 1 winze, extended 29 ft; south drift from same winze extended 16 ft. During the week 482 tons and 800 pounds of ore have been extracted, and 600 tons milled, the assay value of which was $28.43. Bullion on hand, $24,421.39.

MEXICAN.—Miners, 58; surface men, 14. On the 2300 level are enlarging and retimbering the main lateral drift. The joint Ophir winze has been sunk 14 ft. The north lateral drift, 2500 level, extended 26 ft.

OPHIR.—Total number of men employed, 134; miners, 73; surface men, 11; laborers, 10; engineers, 10. Ore is being extracted on the 2100 level. Amount of ore extracted during the week, 114 tons 600 pounds; sent to mill, 100 tons 1,700 pounds; assay value not yet received from mill. On the 2300 level joint Mexican east drift extended 14 ft; north drift on 2500 level extended 30 ft; joint Mexican east crosscut on this level extended 20 ft; east drill hole, 2500 level, extended 180 ft.

CALIFORNIA.—Ore is being extracted on the 1500, 1650 and 1750 levels; winze on 2000 level sunk 9 ft; north lateral drift, 2300 level, extended 4 ft; 707 tons of ore extracted and sent to the mills, assaying $28.78.

CON. VIRGINIA.—Ore is being extracted on the 1650 and 1750 levels; the joint California crosscut, 2300 level, extended 21 ft; south drift, same level, advanced 13 ft; drain tunnel to Sutro branch tunnel completed; 1,383 tons of ore extracted and sent to the mills; assay, $51.06.

C. & C. SHAFT.—Miners employed in California and Con. Virginia, 30; surface men, 32. Shaft sunk 8 ft; total depth below 2300 station, 54 ft.

G. & S. AND B. & B. SHAFT.—Men employed, 48; sunk and timbered shaft, 30 ft; total depth, 1,125 ft.

HALE & NORCROSS.—Engineers, 3; firemen, 3; surface men, 18; miners, 33. Main incline, 167 ft on slope below 2200 level; placing air pipe in north drift, 2100 level; repairs made to main shaft and incline; overhauled V-bob; temperature, 2200 level, 116°.

CHOLLAR.—All work done through C. N. S. shaft. This shaft is not an incorporation, hence escapes the provisions of the Felton bill. Regular statements will, however, be made when work in the south drift is resumed. Yesterday a strap of the pump rod of the shaft broke and delayed pumping, but was repaired and pumping resumed last evening. No change in the flow of water into the shaft.

BULLION.—Miners, 29; surface men, 19; diamond drill run on the 2350 level; 2450 level, 25 ft run east. Joint Julia shaft sunk 25 ft.

CON. IMPERIAL.—Engineers, 7; miners, 18; surface men, 11; completed 200 ft of drain in main lateral drift, 2800 level; still at work on it; also repairing and retimbering drift.

CROWN POINT.—Men employed, 39. Incline winze sunk to a point 25 ft below the 3000 level for sump; 3000 station completed; dimensions, 25x9x10 ft; drift started east and run 18 ft; place 14x4 cut out for blower engine.

BELCHER AND JOINT SHAFT.—Men employed, 84, viz.: Miners, 44; carpenters, 2; blacksmiths and helpers, 4; machinists, 2; engineers, 10; firemen, 6; pump men, 2; top men, 14. The north drift on 3000 level, to connect with Crown Point winze, was advanced 35 ft, making its total length 75 ft from incline. The drill in the face of cast crosscut No. 2 was continued a further distance of 5 ft and was then stopped on account of the heavy flow of hot water. This, together with handling the water and making some needed repairs through the mine, was all the work done during the week.

OVERMAN.—Miners, 24; station tenders, 3; carmen, 2; watchman, 1; chief engineer; engineers, 3; firemen, 2; blacksmith and helper; machinists, 3; machinist's helper; foreman; shift bosses, 3; carpenter; repeman and assistant; oiler, woodman, clerk, surveyor, attorney. Crosscut No. 3 has been extended 15 ft through hard porphyry and discontinued. Crosscut No. 4, 150 ft south of winze, has been extended 18 ft. Drift west from upraise, from 700 level, has been extended 41 ft. Forman shaft has been sunk and timbered 25 ft; total depth, 1,075 ft.

CALEDONIA.—Miners, 12; watchman, 1; chief engineer; engineers, 2; machinist and helper, 1; foreman, 1; pumpman, 1; clerk, 1; surveyor, 1; attorney, 1. South crosscut has been extended 34 ft through hard porphyry that does not blast well. Forman shaft has been sunk and timbered 25 ft; total depth, 1,075 ft.

SUTRO TUNNEL.—Made in north header, 80 ft; total from C. & C. shaft connections, 150 ft. South header made 65 ft.

BRISTOL DISTRICT.

LIVELY.—Pioche *Record*, May 15: Upper Town, at the mill site of the Bristol silver mining company, presents a lively scene, everybody as busy as bees. The ground is strewn with lumber and heavy machinery, and work in general is being vigorously pushed ahead. The artesian borer is doing good work, and is down 140 ft with 80 ft of water. The large excavation for the reception of the mill has already been completed. A kiln of 100,000 bricks, to be used in the construction of the same, will soon be fired, and other improvements are under way, including that of a large 2-story building, the private boarding-house of the company, and containing the private rooms, offices, etc., to be hard finished throughout, and when completed will be the finest of its kind in the State.

THE Meudha, of the Hillside company, is continually improving, the shaft at 120 ft is all in ore with no walls. The drift from the 100 level is carrying ora full in the face with an average assay value of $50, and from 20 to 25 tons are daily being shipped to the furnace.

CUSTOM ores are coming in rapidly; the Day is shipping 10 tons per day of high-grade ore, and the Midnight, of Blind mountain, have already on the furnace dump a good many tons of their first-class rock.

A LARGE amount of machinery for the Bristol company has been coming in the past few days.

THE Hillside furnace is turning out large quantities of bullion, running it out much faster than teams can haul it away. The dump is covered with it in huge sacks, awaiting shipment.

THE streets are crowded with teams bringing in machinery, etc., and going out laden with bullion.

I X L DISTRICT.

STRIKE.—*Silver State*, May 17: A rich strike is reported to have been made last week in the Bayfield mine, in I X L district. The ore assays high, and there is plenty of it. Well-informed citizens of Churchill county, in which the mines are situated, a short distance south of the Humbolt line, predict that there will be over 1,000 voters in the county in less than 2 years.

SCHELL CREEK DISTRICT.

STARTING UP.—White Pine *News*, May 12: On Monday last articles of incorporation of the Woodstock Con. Silver Mining Co. were filed in the office of the County Clark, with the following directors: E. B. Dickinson, of Shellbourne; Frank B. Dole, John J. Hayes, John D. Morton, Monroe T. Quimby, Jonathan R. Gay and Edward F. Hagar, of Boston, Mass. The object for which the company is formed is the mining and milling of silver ores and conducting generally all work incidental thereto. Capital stock, $1,000,000, divided into 100,000 shares, of the par value of $10 each. Principal place of business, Schellbourne, White Pine county, Nevada. The company is incorporated under the laws of this State, by a number of Boston capitalists, who are already largely interested in mines in White Pine county, notably the Bay State mine at Newark and the Trench mine in this district. The Woodstock Con. company has purchased a number of mines in the Schell Creek mining district, and, we understand, will soon commence work upon them. Eastern White Pine seems to be attracting the attention it so richly merits, and the coming summer will see a great advance made in the mining interests of that quarter.

ARIZONA.

MONTEZUMA DISTRICT.—Yuma *Sentinel*, May 15: The new copper mines in the Montezuma district, southeast of Castle Dome, are making a good showing. On the "Echo" a shaft 10 ft deep has been sunk, and crosscutting 20 ft partly across the vein, which is over 40 ft wide, over 10 tons of ore are on the dump, and a shipment will be made immediately.

COPPER.—*Record*, May 15: The Bronco copper mine, in the Pinachuca mountains, is being worked and showing up finely.

SILVER DISTRICT.—Cor. Phœnix *Exponitor*, May 14: I am glad to record the fact, as reported here on excellent authority, that Mr. J. D. Wilson, in the interest of some New York parties, has purchased the bond of $100,000 on the Red Cloud mine, from the Iron Cap company, for $15,000, and will open up on that magnificent property with a force of 60 men. When this mine is developed, there is not a better property known in the Territory. The Emma has shut down for a short time. The Iron Cap is turning out plenty of rich metal. Mr. Sumner has sold one-half of the Mariaura mine for a 100-ft shaft, to be sunk thereon. The parties are highly pleased with the present prospect. The Jackson furnace extracted 34 ounces of silver and 450 pounds of lead from 1,000 pounds of Princess ore this week.

GLOBE DISTRICT.—*Silver Belt*, May 14: Silver glance in quartz has appeared in the Buffalo shaft at a depth of 111 ft. An unusually rich strike has been made in the Nugget, in new shaft at a depth of 55 ft. Ten thousand pounds of Townsend mill machinery was delivered by Buckslew & Ochoa on the 6th. Sinking for water at mill site was commenced Tuesday. The completion of these mills will very greatly increase the shipments of bullion from Globe. Work on the Antler and Washington has greatly delayed by contract freighters. The much needed hoisting works were shipped in San Francisco on the 15th of March. Mr. Clark supposes that the machinery is on the road, somewhere between the railroad and the mines, and would be glad to be informed just where.

DAKOTA.

SILVER PLUME.—*Black Hills Times*, May 12: The Silver Plume mine, on Bald mountain, is one of the best locations in that district, and has shown some of the best ore that has ever been found up there. This mine has been purchased or bonded by a company of wealthy Eastern capitalists, and a Mr. Brickerdiko has come on and taken charge of the mine as Superintendent. He is working day and night shifts, and proposes, if necessary, to run the tunnel clear through the mountain. He has procured enough T rail iron to lay a track 250 feet, and thinks that distance will strike the ore body. The track is now 170 ft, and the mine is well supplied with cars of the best make. This tunnel will be driven in 300 ft, if the ledge is not sooner found. Some fine bodies of ore have been found at this distance.

NEW MEXICO.

EUREKA.—Cor. Silver City *Herald*, May 12: The California mine is looking well, with a shaft down 13 ft and some good ore in sight. J. W. Jones has discovered another mine that has been walked over hundreds of times by all in the camp, and a party looking over the dump says he can see free gold in the rock. Howard & Co. commences work shortly on the Julia, and the camp is now putting on a lively appearance. As I think few persons know the extent of this belt, I will state that mineral is discovered for a distance of 15 miles 1 way by 3 miles the other, and the camp is not ¼ prospected as yet. There is room here for 1,000 men to prospect with a certainty of finding ore.

GEORGETOWN.—The Mimbres mining company (this is the name that the company who purchased the Naiad Queen, McNulty, etc., has adopted) has taken out a considerable amount of ore during the month of April, some of which has been very high grade. They are working the Naiad Queen only at present, which mine is yielding ore in abundance. Seventy-five men may be worked profitably in this mine at present. The Commercial, which lies contiguous to the Naiad Queen, is turning out some very good ore. Kelley & Orwin, who are leasing on this mine, have struck a large body of very fine ore. The McOregor is also looking as well as ever, and is turning out its usual quota of rich and very free ore. Bracaw & Perry, who are still leasing on the McNulty, are taking out good ore in large quantities. Helde & Slosser are now sinking on their Bobtail mine in the same locality. They have good-looking ore on the surface, and the formation is same as above. Lucas & Holmes will commence work on the St. Louis, located about 3 miles north of this place. We think that no place in the country offers greater inducements to capitalists for investments in mining property that will pay than Georgetown and immediate vicinity, judging from the fact that our mines have ever been self-sustaining from the time that the first pick was stuck in them until the present. It is true we are a little off of the regular stage route, but they might go farther and fare worse in their search of paying mines.

UTAH.

STOCKTON MINES.—Cor. Salt Lake *Tribune*, May 15: With the advent of genuine spring weather we are pleased to note the real beginning of a real boom in this camp. All this, notwithstanding the oft repeated sayings of old Pacific slopers that the Stockton ores were all surface deposits and had no depth to them. It would certainly astonish some of our old friends who hold that opinion to come here and go down into the Great Basin, Calumet, Leonore, Rush Valley, Reno, Josephine and other mines that are going down and finding ore as they go. The Basin main shaft is about 550 ft down, and they have a six-ft breast of ore at the bottom. Gen. Connor, managing director, is at present putting in an 80-horse power engine and boiler at the old Longmaid smelter. He has six of the latest pattern of improved jigs and two crushers, with which he will concentrate from 40 to 50 tons of ore per day. He is preparing to rebuild one of the old stacks to smelt the Basin, Rush Valley and Silver King No. 2 ores. The Leonore mine, on the northwest side of the same hill containing the Great Basin and National, was bought by Mr. Humphrey a few weeks since for $10,000 cash. The Leonore is going down at the rate of 3 ft per day, and has about 40 tons of $50 ore on the dump. The Reno is paying handsomely of late. This camp is employing about 150 men at present.

BIG COTTONWOOD.—Our winter in Big Cottonwood has been the longest and severest that old timers can call to memory. Snow has fallen in the head of the canyon to a depth of 12 to 15 ft, and has impeded mining operations materially. Mining operations during the winter have been carried on as extensively as the weather permitted, and shipments of ore from the principal mines were carried on until about the 15th of March. We learn that the head of Big Cottonwood is becoming an attractive field for prospectors, owing, perhaps, to the Ontario belt crossing the canyon, taking a southeasterly course, touching at the head of Snake creek and continuing toward American Fork canyon. Several prospectors have sunk shafts through the snow in order to obtain a peep of "Adam's land" which resulted in locating the ground. Scott Hill, which was in so active operation several years ago, has again resumed activity. The Elgin is producing considerable good ore similar to the Ontario. The Prince of Wales, Butte, Oregon and others have worked a moderate force all winter and have considerable ore ready for transportation. The Kesler mines have worked a good force all winter and taken out considerable ore. Shipment will be continued by June 1st, or as much earlier as the snow leaves us. The Reed & Benson has produced a large quantity of high grade ore this winter from the Ophir, and shipment will be resumed at an early date. The Thor has worked a force all winter and made important connection by tapping the main ore vein with a tunnel. Some good strikes were made and several tons of $130 ore extracted. The Maxfield, at Argenta, is improving immensely. Shipments of $100 ore have been in progress most of the winter, but owing to the water, operations on the mine have ceased temporarily. The management of the Fairview, Red Pine and of other good looking mines situated in proximity to the Maxfield, contemplate working extensively. There is considerable excitement regarding the recent discovery of a gold belt some 4 miles above the mouth of Big Cottonwood, extending southward toward Little Cottonwood canyon. Two or three companies are prospecting here with flattering results. Several locations have been made and the gold-bearing quartz assayed with a production of over $25 in gold.

BINGHAM.—The Mineral Point company are taking time by the forelock and have already commenced operations. This company possesses some of the finest gold property in Bingham, and situated in the very heart of the great gold belt. Their mines consist of the Prescott, Baby, Vere, General Shelby, Woodman, Stephenson, Junction, Mat Disborn and Zaidee, all comprised in one group. The Baby, Shelby and Vere appear to be the most valuable of the group, and join each other. A continuous vein of gold ore has been exposed, averaging from 20 to 60 ft wide. The veins of this property outcrop considerable, and the principal work now in progress is stripping the veins. As soon as this work is performed it is the intention of the company to put on a large force of men. The Overland is receiving a thorough overhauling in the way of timbering, etc. Mr. Blenney is determined to have his mine in good shape for spring operations. Stewart No. 1 mill is taking a rest, it is said, for repairs, only a few men are working on the mine. Stewart No. 2 mill has not yet started, the roads not being sufficiently good to warrant hauling at the mine. Dave Buel has received the appointment of General Superintendent, with Colonel Hudson as Superintendent. Work so far has not been commenced in earnest. A shaft is being sunk on the ledge. Jennings is pushing his tunnel ahead in Carr Fork. It is now in about 600 ft. The Agnes is working on lease by Hank Crismon & Co. Ore does not seem to be very plentiful, but what is obtained is of high grade. The Harriet has a number of men at work taking out gold ore, some of which runs out high. Foley and Jordan are working the Ten-forty. They have recently struck some high grade lead ore. McCourt is working the Neptune, and has recently struck a nice body of first-class and jigging ore. Mining timber is in great demand, but the roads are in such an outrageous condition that it is almost impossible to get a wagon over them.

Utah's Mineral Wealth.

The acknowledged superiority of Utah in the matter of gold and silver mining, and the attractions connected with a search for the precions metals, have tended to keep in the background her greater riches in the line of usefnl hut less showy mineral. As an iron and coal producer this Territory is destined to become famous. In this contry, as in England, these two great sources of mineral wealth exceed all others in magnitude and importance. Then we have within our boundaries abundant and varied deposits and veins of mineral which in their crude state enter into the manufacture of necessary, useful and ornamental articles. Prominent among these deposits are the heds of fine kaolin or porcelain clay, suitable for manufacturing white or granite waro equal to the best of English make. Feldspar, quartz and silicious sand with which to temper and glaze such ware are found contiguous to thc clay heds, and of the finest quality. All the necessary material for a large and profitahle manufactory of white porcelain ware lies unused and in abundance within from ten to thirty miles of this city, and the wonder is that capitalists at home or ahroad have not ere this secured these treasures and estahlished snecessful potteries here.

What has been said of crockery ware holds good with regard to tho manufacture of glass in all its forms. The hest of materials for this purpose exist in ahundance at our very doors. Fire clay, capahle of withstanding the severest applicatiou of heat, is now heing made into the hest of fire brick, and the manufacture can be indefinitely extended. Material for the manufacture of paints and pigments is ahundant and easily accessihle. Marhle, alahaster, gypsum, hismuth, sulphur, salt—in short, nearly, if not qnite, all the materials of practical use are stored up in vast quantities within the hill and mountain rangos of Utah. It is but a question of time when, with the extension of our railroad system and the influx of capital and population, these waiting elements of wealth will become active factors in solving the problem of material prosperity and political regeneration so intimately connected with the futuro of this Territory.—*Salt Lake Tribune.*

THE BEAUTIES OF GUNNISON.—A letter from Denver was received in town on Saturday from one of a party of twenty or more Black Hillers, hound for Gunnison, whose rendezvous for the present is at the American house in that city. This party writes that the deep snows will prevent their getting into the Gunnison country for a month, perhaps six weeks more. Since this letter was written a violent snowstorm has raged from eastern California along the line of the Uuion Pacific road to Laramie and up to Cheyenne, extending south and north of the line of the Union Pacific from forty to eighty miles. This snowstorm is represented to have heen the heaviest for years, the drifts in some places in the mountains being twenty to thirty feet. Before the late storm Gunnison had snow ennugh to prevent emigration into that El Dorado, but with the fresh instalment it is probable this country will admit of mining operations near or ahout the next fourth of July. A few months after that the snows will come again, and then Gunnison will he locked up until another year comes around.—*Colorado Miner.*

Shell-lac and Lac Dye.

In order that onr readsrs may learn the style of the plant *Larrea Mexicana*, and of the deposit upon it, we have had an engraving made of two twigs, one showing the plant in its healthy stats, the other as it appears after the heavy coating is fixed upon it by ths insect. Former articles pnhlished in the PRESS from the pen of Hon. B. B. Redding, have given descriptions of the plant, and the manner of its occurrence. Since it was first made known as a material worth an effort to gather and market, there has besn received farther information concerning the plant and the hahits of the insect. Mr. Redding, who has just returned from a trip to Arizona, assures us that he saw plenty of the shruh everywhere on the line of the railroad ahove bottom lend. At a great many stations there is no other shruh in sight. Mr. Redding thinks the collecting of the lac could prohahly he made profitahle in the vicinity of Stanwix statiou and Texas Hill, hetween 60 and 100 miles east of Yuma. He learned from psrsons there that nearly all of the plants on the mesa lands ahove Salt river contained lac in quantity. The conclusion to which Mr. Redding arrived from his examination is, that whilc ths plant is ahundant almost everywhere in Arizona, yet there are certain localities where the insect is very prevalent, and where, without douht, good wages conld be made in collecting the lac, whils in other places the lac could not he found on more than say two out of every ten bushes. Mr. Redding was informed that the Indians use lac dye extensively in painting their faces, and in other ways. The Indians state that it would he mnch more readily found in about three months. Nearly all that is found now is lac from last year. The Indians also state that when the lac hardens in the fall on the hushes, a great deal is broken off in the winter by the winds whipping the hranches.

It appeers from a paper reed hy Prof. Stillman at the last meeting of the Academy of Sciences that a similar gum appears on the so-called "cat-claw" of Arizona. Twigs of that plant, which has been identified hy Prof. Hilgard, as the *Acacia Greggii*, a deciduous shruh or tree common in Arizona and Mexico, were coated with a scantier depoeit of the gum than the twigs of the larrea possessed, and the irregularity of the surface of the resin also appears to indicate that the acacia does not present so favorahle conditions for the production of the resin as the larrea.

In its general properties and chemical reactions, the lac from the acacia agreee with that from the larrea, hut the amount of coloring matter is decidedly less. The epecimens of acacia-lac were collected during the season when the twigs were dry and the leaves dead, and none of the specimens examined contained the masses of eggs with red juice in the cells. The cells were dry and contained only the dried or nearly dry sacs. It is therefore not improhable that if collected at other eeasons the dye would he present in greater quantity.

In order to make our ehowing of the ehell-lac and lac-dye interest more complete, we shall give some interesting information of the methods employed in the important lac industry of Asia. These facts are fresh, as they are taken from a work puhlished the present year in London, entitled "Jungle Life in India," written hy Valentine Ball, member of the Geological Survey of India:

"Lec (or as it is called in Hindustani, *lah*) ie eecreted hy an insect (*Coccus lacca*) on the branches and twigs of certain jungle trees. The principal of these are the khusum (*Schleichera jujuga*), plas (*Butea frondosa*), and hier (*Zizyphus jujuba*). The lac from the first-mentioned, the khusum, is more highly esteemed than that from the others. To some extent the lac ie found occurring, so to epeak, spontaneously, and ie collected hy the forest tribes, and hrought hy them to the fairs and hazaare for sale. Where, however, there is a regnlar trade in stick-lac, propagation of the insect is eystematically carried on hy those who wish for a certain and ahundant crop. Thie propagation is effected hy tying small twigs, on which are crowded the egge or larvæ of the insect, to the hranches of the above-named epecies of trees. These larvæ are technically called 'seed.' The larvæ shortly after sowing epread themselves over the hranches, and, taking up positions, eecrete around themselves a hard crust of lac which gradually spreads till it nearly completes the circle around the twig. At the proper season the twigs are hroken off, and we must suppose them to have passed through eeveral hands, or to have been purchased directly from the collectors by the agents of the manufacturer. On arrival at the factory, they are first placed hetween two powerful rollers, which, hy a simple arrangement, admit of any degree of approximation. The lac is then crushed off and is separated from the woody portions hy screening; it is next placed in large tuhs half full of water and is washed hy coolies, male or female, who, standing in the tuhs, and holding a har above with their hands, stamp and pivot ahont on their heels and toes until, after a succession of changes, the resulting liquor comes off clear. Of the disposal of the liquor drawn off at the successive washings I shall speak presently. The lac having heen dried is placed in long cylindrical hags of cotton cloth of medium texture, and which are about ten feet long and two inches in diameter. These bags when filled have somewhat the appearancs of an enormous Bologna sausags. They are taken to an apartment where there are a number of open charcoal furnaces. Before each of these there is one principal operator and two assistants. The former grasps one end of the long sausage in his left hand, and slowly revolves it in front of the fire; at the same time one of the assistants, seated as fer off as the sausage is long, twists it in the opposits direction. The roasting hefore the glowing charcoal, soon melts the lac in the portion of the hag nearest the operator's hand, and the twisting of the cloth causes it to exude and drop into a trough placed helow. The troughs which I saw in use wsre simply leaves of the American aloe (*Agave Americana*). When a sufficient quantity, in a molten condition, is ready in the trough, the operator takes it up in a wooden spoon and places it on a wooden cylinder some eight or ten inches in diameter, the upper half of which is covered with sheet hrass. The stand which supports this cylinder gives it a sloping direction away from the operator. The other assistant, generelly a woman, now steps forward holding a strip of ths agave or alos hetween her hands, and with a rapid and dexterous draw of this the lac is spread at once into a sheet of uniform thickness which covers the upper portion of the cylinder. The operator now cuts off the upper edge with a pair of scissors, and the sheet is then lifted up hy the assistant who waves it ahout for a moment or two in the air till it bscomes quite crisp. It is then held up to the light, and sny impurities, technically "grit," are simply punched ont of the hrittle sheet by the finger. The sheets are laid upon one another, and the tale, at the end of the dey, is taken, and the chief operator paid accordingly—ths assistants receiving fixed wages. The sheets are placed in packing-cases, and when subjected to pressure hreak into numhers of fragments. In this

TWIGS OF LARREA MEXICANA AND DEPOSITS OF GUM-LAC.

fresh etate the finest quality ie a very heantiful object, having a rich golden luster. On seeing it thus, one cannot help feeling regret that it ie not nice to eat—the hest Everton toffee never looked more tempting. The ahove is the history of shell-lac, from its birth in the jungle to its appearance in the world as the commercial article. From the manufacturer it passee through the broker'e hands to the merchant, and from him again to the manufacturere of varnishere, sealing-wax, and otber commodities of which it is an ingredient.

"The dark red liquor resulting from the washing ahove descrihed, is etrained, in order to remove all portions of woody fiher and other foreign materials. It is then passed into large vats, where it is allowed to settle; the sediment is subjected to various washings, and at last allowed to eettle finally, the supernatant liquor heing drawn off. The eediment, when it is of the proper consistency, is placed in presses, from which it is taken out in the form of hard dark purple cakes, with the manufacturer's trade-mark impressed upon them. This constitutes what is known as lac-dye. By the addition of mordants, this dark purple eubstance yields the most hrilliant scarlet dyes, which are not inferior, I believe, to those produced hy cochineal. The dye which is thus separated from the lac hy washing, is said to he the body of the insect, not a separate secretion."

WORK on the Epley mine was commenced last Tuesday, under the direction of Prof. Thomas Price, of San Francisco, and will he vigorously prosecuted henceforth.

THE Original Amador mine is still closed down, hut it will no douht he etarted up again in a ehort time.

Base Ores.

The question has of late been frequently asked: "What is to he done with the hase ores recently found on the Comstock?" The answer is: "They will he reduced." The subject is exciting considerahls interest here just now and is assuming some importance.

The Alta ore is not all hase. The top of the hody only has heen explored and that hut partially. Still enough has heen done to warrant the conclusion that the ore hody will pay for mining and milling and something more. The ore hody was cut for a distance of 55 feet hy the south lateral drift. Crosscnts have shown it to be 24 feet wide.

But, as stated above, this is not all hase. One-half of it is free-milling ore. There will be no need of concentrators to work it. The richest portions of the vein lie in streaks and hunches. The formation pitches down in so marked a manner that further explorations alone can tell its reel value. But thcre is a valuahle body of the hass ore there hesides the free-milling portion of the vein.

The hase ore in Alte is regular smelting ors, carrying from 55% to 72% of lead and a sufficient amount of iron to flux the whole. It aleo aesays well in silver, lightly in gold. The free-milling ore is low gradc, averaging ahout $30 per ton.

In North Bonanza there is a large quantity of hase ore. The hody was struck on the 300 level, and extends certainly 600, and prohahly the hulk of the formation has not yet heen reached. Men are at work in the croppings, too, and are getting ores which run from low grade to $200 and $300 per ton. On the 400 level the ore hody is certainly 70 feet long and 30 feet wide, and its real length is not yet determined.

Here, then, is ore enongh to make it an ohject to have it reduced. The plan proposed is to use concentrators first and theu mill. There is no difficulty in this, since the experiment has been tried and found to work well.

Since neither of these ore bodiee have heen efficiently developed to enahle one to determine their extent, all endeavors to estimate the yield of the base ores are useless. They are certainly worth reducing.—*Gold Hill News.*

THE FASTEST ENGINE.—The Baldwin Locomotive Works have jnst turned out a very remarkahle specimen of locomotive work, which is guaranteed to make 90 miles within 90 conecutive minutes. This engine is to be placed upon the road hetween Philadelpbia and New York, and is to make the distance—90 milee—with its train of cars in one hour and a half. Should this attempt prove successful, other engines of the same stamp will be huilt.

THE Manzanita gravel mining company, to work a mine near Nevada City, has heen incorporated under the laws of New York, with a capital stock of $250,000.

Mining in Bodie.

Previous to the past summsr says the *News*, mining in Bodie was conducted in the most primitive manner by all on the great lods except two or three companiss. During tbe past season the usual appointments necssary for the rapid and economical development of mining property were placed upon a lergs numhsr of our claims. Heavy hoisting machinery superseded the windlass and whim, and as the water levels were reached and the sbafts advanced in depth, the flow becoming strongsr and stronger, the water tubs were superseded hy powerful steam pumps; and they, in thsir turn, are now heing replaced by either large Cornish pumps or ths direct-acting compound expansion engine and hucket pumps that hid fair to replace all other pumping machinery for deep mining. Our companiss no longer scratch upon and near the snrfacs, expecting to find large ore bodiss; hut with the trne miner's instinct and knowledge are following the scams and stratas of rich ore to such depths as will give assurance of finding heavy hodies of pay ore. To-day ws havs 31 steam hoisting works all actively engaged in this commendahle work and in the most scientific manner sinking two or three-compartment shafts to the lower depths. Our mining works are now equal to any found on the coast, their power and qnality heing a living assurance to all that the men interested have full and unlimited confidence in the mining outlook and the solid merit of our mines. The coming season will witness the uncovering in Bodie of mines rich in silver and gold and of such proportions that the far-famed Standard will hs eclipsed. Silver Hill, the great center of Bodie's wealth, will he pierced at all points. Her ledges will be opened, heing in size, strength and quality with the Comstock, and that too before meny months shall have passed. The Addenda, the Oro and the North Noondey will each speak its piecs and show the world what there is in them. The Booker, the South Noonday, the University and the Queen Bee, each pressing forward the work of devslopmsnt with all the speed tbat men and moncy can accomplish, will add their quota to swelling the fame of the south end Bodie mines and assist in estahlishing their great valns and psrmsnency.

Recent Decisions Relating to Patents, etc.

We give below brief abstracts of decisions* rendered upon patent cases in litigation, for the benefit of our readers:

DECISIONS OF THE U. S. COURTS.

Baker vs. Selden.

Supreme Court of the U. S.—Decided October term, 1879. Appeal from the Circuit Court of the U. S. for tbe Southern District of Ohio. Mr. Justice Bradley delivered the opinion of the court:

1. The copyright of a hook, if not pirated from other works, will be valid without regard to tbe novelty of the subject matter.

2. The description of an art in a book entitled to the benefit of a copyright lays no foundation for an exclusive claim to the art itself. The description alone can be protected by copyright. The art can only be secured, if secured at all, by letters patent.

3. A work on the subject of book-keeping, explanatory either of old systems or of an entirely new system, considered as a book conveying information on the subject and containing detailed explanations of tbe art, is the subject of a copyright; but the use of tbe peculiar systems of book-keeping described cannot be protected thereby.

4. Blank account books with ruled lines and headings are not the subject of copyright, nor can the copyright of a work on book-keeping, with portions illustrated by such ruled lines and headings, secure the exclusive right to make, sell and use account books prepared upon the plan set forth in such book.

5. Although tbe proofs show that the defendant makes account books arranged on substantially the same system as that explained in the copyrigbted book of the plaintiff, it does not appear that be bas violated the copyright of the same regarded merely as an explanatory work, and, as the plaintiff is not entitled to an exclusive right in the system, the charge of infringement is not sustained.

The decree of the Circuit Court must be reversed, and the cause remanded, witb instructions to dismiss tbe complainant's bill.

---

* More complete reports of the proceedings may be found on file in the office of the MINING AND SCIENTIFIC PRESS Patent Agency, 202 Sansome street, S. F.

GREAT excitement exists in and around Tubac owing to recent discoveries of many rich gold ledges. The rock is free and easily worked in the old Mexican arastras, of which there are many along the river. It is mostly flour gold, very fine particles in the rock, and arastras $40 to the ton. Some thirty or forty claims have already heen taken up, hy Mexicans mostly, who are taking great interest in mining. Mr. C. A. Shihell and Judge Jos. Neugass are interested here, and intend visiting Tubac in a few days. The gold mine of fahulous richness reported found on the west side of the Santa Ritas, some twenty or thirty years ago, may yet he discovered and duly located. If we rememher aright, the specimen was brought in hy Major Duffield, who was murdered at the Bronco mine.—*Tucson Record.*

DYNAMITE IN WET HOLES.—The disastrous exploeions of dynamite that frequently occnr when that suhstance is used in wet holes, are explained as follows: After pouring dynamite into water, the sand goee to the hottom, hut the nitro-glycerine floats on the surface, and if the temperatnre he only to a small degree increased, explodes.

DOWNS MINE.—The rich strike in this mine has set things hooming, claims and extensions are the order of the day. Rock that glistens with gold is on exhihition at the hanking house of L. McLaine. In some of the specimens a little rock is mingled with the gold.

The Engineer.

Ohio River Improvements—Movable Dam System.

The Ohio River Improvement Commission held an adjourned session in the city of Washington with a view to advance the interests of the improvement of the Ohio river. Some 20 members were in attendance. Col. Wm. E. Merrill, the United States Engineer Officer in charge of the improvement described the progress of the work. After careful study and earnest investigations of the movable-dam system of France, the Engineer department has recommended a trial of this system on the Ohio, and one year ago a movable dam was begun at Davis island, a few miles below Pittsburg. If this dam should prove suitable to the peculiar navigation that obtains on the Ohio, and is satisfactory to those who control the trade, it is proposed to apply the system as far down the river as it may be found to be suitable, probably as far as Cincinnati or Louisville.

The general features of this movable dam may be briefly given as those of a dam that is so manœuvred that when there is a good stage of water, say six feet, such that regular boats can run, and no auxiliary to navigation is required, the dam, or obstructions so called, can be lowered on to the bottom of the river, and submerged, so that all kinds of river-craft can pass over them; but when the river falls so much that boats can not run for want of sufficient depth of water, the adjustable dam is raised, and the well-known system of slack-water navigation then obtains, by means of the ordinary lift-lock built at one end of the dam. The lock of the Davis Island dam is 106 feet wide, and 600 long, and will take a whole tow of coal-barges without breaking it up to be passed through. When the river is up, the dam is down and the tows and other craft pass over the site of the dam, there being scarcely a perceptible break in the surface of the water. At such times the lock is to remain open, and the boats may pass through it, using it as a part of the river channel. Col. Merrill found these aids to navigation in use on nearly all the rivers of France, to the number of about 125 dams and locks, varying considerably in the detail of their operation and management, but all giving general satisfaction. Similar locks and dams are now being constructed on the Kanawha river in West Virginia, under the direction of Col. Wm. R. Craighill, of the United States Engineer Corps.

The Baltic and North Sea Ship Canal.—According to the plans prepared by Herr Dahlstrom, to whom a preliminary concession for the enterprise has been granted, the proposed ship canal from the Baltic to the North sea will be traced from the Bay of Kiel to Brunsbuttel, in the estuary of the Elbe. Its depth throughout is to be 20 feet 9 inches, its width at the surface of the water 160 feet, and at the bottom 64 feet; the banks consequently have a very gentle slope. Provision will, moreover, be made, by the adoption of a peculiar system of locks and reservoirs, for increasing the depth of the water to 25 or 26 feet whenever it may be desirable to do so, and this depth will allow of the passage through the canal of the heaviest German iron-clad afloat—the *König Wilhelm*, a vessel of 9,603 tons displacement, and the largest ship in the German navy, drawing only 26 feet. The canal can, it is calculated, be completed in six years, and will, it is estimated, cost $3,750,000, or about $2,250,000 less than the estimates made a few years ago of the cost of constructing a canal 31 feet deep and 22 feet wide at the surface of the water.

A French Ship Canal at Home.—Of the many ambitious engineering works of improvement which the French are now debating, perhaps the most notable is the project for connecting the Atlantic and Mediterranean by a ship canal from Bordeaux to Narbonne. This scheme, which was some time since made the subject of a special investigation by M. Lepinay, is now being very generally discussed, on the strength of his report to the Vice-President of the French Senate. It is urged in this document that the execution of this project is a work of national preservation, and one from which France would derive immense advantages, military, economical and commercial. The cost of construction is estimated at about 75,000,000 francs. With the Simplon tunnel, M. de Freycinet's magnificent system of railroads and canals, the Algerian sea, and the Saharan railway, to say nothing of the Channel tunnel, and the Lesseps project to pierce the American isthmus, the French will have enough to keep them busy for many years to come.

The Sahara Railroad.—Three points on the coast of the Mediterranean have been proposed for the commencement of the line of railroad across the desert of Sahara. Morocco, Algeria and Tunis have each special recommendations, but there is a perfect unanimity of opinion regarding the expediency of making the route, from whatever place it is to be started, strike Insalah, a town which commands the whole line of traffic between the north and Timbuctoo. It is situated on the verge of the desert at the southern boundary of the French possessions in Northern Africa, and it is healthy and well supplied with water. The inhabitants have advanced far beyond the nomadic stage of civilization, and they are desirous of more intimate communication with civilized society.

Useful Information.

How to use Cements.

Quite as much depends upon the manner in which a cement is used as upon the cement itself. The best cement that was ever compounded would prove entirely worthless if improperly applied. The following rules, says the *Druggists' Circular*, must be rigorously adhered to if success would be secured:

1. Bring the cement into intimate contact with the surfaces to be united. This is best done by heating the pieces to be joined in those cases where the cement is melted by heat, as in using resin, shellac, marine glue, etc. Where solutions are used, the cement must be well-rubbed into the surfaces, either with a soft brush (as in the case of porcelain or glass), or by rubbing the two surfaces together (as in making a glue joint between two pieces of wood.)

2. As little cement as possible should be allowed to remain between the united surfaces. To secure this the cement should be as liquid as possible (thoroughly melted if used with heat), and the surfaces should be pressed closely into contact by screws, weights, wedges or cords until the cement has hardened.

3. Plenty of time should be allowed for the cement to dry or harden, and this is particularly the case in *oil* cements, such as copal varnish, boiled oil, white lead, etc. When two surfaces, each half an inch across, are joined by means of a layer of white lead between them, six months may elapse before the cement in the middle of the joint has become hard. In such cases a few days or weeks are of no account; at the end of a month the joint will be weak and easily separated, while at the end of two or three years it may be so firm that the material will part anywhere else than at the joint. Hence, when the article is to be used immediately the only safe cements are those which are liquefied by heat, and which become hard when cold. A joint made with marine glue is firm an hour after it has been made. Next to cements that are liquefied by heat are those which consist of substances dissolved in water or alcohol. A glue joint sets firmly in 24 hours; a joint made with shellac varnish becomes dry in two or three days. Oil cements, which do not dry by evaporation, but harden by oxidation (boiled oil, white lead, red lead, etc.), are the slowest of all.

Are Cape Diamonds Real Gems?—A person in England having purchased a ring set with what purported to be a diamond, and having later discovered that the same stone was a "Cape diamond", entered suit at law to recover the money paid for the ring. Judgment was given for the plaintiff on the evidence of several diamond dealers, who testified that "Cape diamonds are not to be regarded as ordinary diamonds, and that they lack the essential qualities of the Brazilian stones, viz., luster, hardness and color." A writer in *Nature* calls attention to this singular verdict, and expresses the hope that, when the case comes up for retrial, the Judge will require some scientific evidence (such as specific gravity or chemical composition) about Cape diamonds.

To determine the number of gas burners for a room of given size there can be no very definite rule for lighting given. Much depends upon *form* of space to be lighted and *color* of surroundings, also of quality of the gas. In ordinary dwellings with white walls and fair quality of gas, a five-foot burner will light brilliantly a space of 1,000 cubic feet. In public buildings, one half of the above amount of light will be sufficient, or one burner to 2,000 feet of space, although it would be well to provide for more light, in case the walls and ceiling should be of somber decoration. Much, of course, depends upon the arrangement of the burners; if uniformly distributed a better general result is attained, and less burners required.

Lithographic Stones.—There is a very large demand for lithographic stone in the United States, and the supply has until recently been chiefly from Germany. Now, however, Canada will probably contribute a considerable share in this trade, for the quarries of Marmora yield a stone which is quite as suitable for lithographic purposes as that obtained from Germany. It has been tested by practical lithographers, who say that its closeness of grain and general adaptability for the purpose will enable it to be used by lithographers with complete success.

Rubber Goods Manufactories.—There are in the United States and Europe more than 150 manufactories of *India-rubber goods*. These employ from 10,000 to 15,000 operatives, and consume annually about 40,000,000 pounds of raw material. The bulk of the crude rubber, and the best quality, is brought from Brazil, though considerable quantities are obtained from Central America, Africa (especially Madagascar), India and the islands of Borneo and Sumatra.

Put to a New Use.—A model fireplace, with fender, fircirons, etc., complete, has just been presented to the Natal Society's Museum by Mr. J. C. Wilson. The model, a perfect work of art, is entirely made of bullets fired at the British troops by the Zulus at Ulundi, and was constructed by a 60th Rifleman, who was present at that battle.

How Slate Pencils are Made.—In making slate pencils broken slate is put into a mortar run by steam, and pounded into small particles. Then it goes into a mill and runs into a "bolting" machine, such as is used in flouring mills, where it is "bolted," the fine, almost impalpable, flour that results being taken to a mixing tub, where a small quantity of steatite flour, similarly manufactured, is added, together with other materials, the whole being made into a stiff dough. This dough is kneaded thoroughly by passing it several times between iron rollers, thence it is conveyed to a table, where it is made into "charges" or short cylinders, four or five inches thick, and containing eight or twelve pounds each. Four of these are placed in a strong iron chamber or "retort," with a changeable nozzle, so as to regulate the size of the pencil, and subjected to tremendous hydraulic pressure under which the composition is pushed through the nozzle in the shape of a long cord, and passes over a sloping table slit at right angles with the cords to give passage to a knife which cuts them into lengths. They are then laid on boards to dry, and after a few hours are removed to sheets of corrugated zinc, the corrugation serving to prevent the pencils from warping during the process of baking, to which they are next subjected in a kiln, into which superheated steam is introduced in pipes, the temperature being regulated according to the requirements of the article exposed to its influence. From the kiln the articles go to the finishing and packing room, where the ends are thrust for a second under rapidly revolving emery wheels, and withdrawn neatly and smoothly pointed. They are then packed in pasteboard boxes, each containing 100 pencils, and these boxes are in turn packed for shipment in wooden boxes, containing 100 each, or 10,000 pencils in a shipping box. Nearly all the work is done by boys, and the cost therefore is light.

The Effect of Salt on Vegetation.—Maple sugar made from the sap of a tree in Williamstown, Vt., at the roots of which the brine from the farmer's beef and pork barrels had been emptied last Autumn, was so salty as to be worthless.

Any fibrous material can be stuck to metal whether iron or other metal, by an amalgam composed of good glue dissolved in hot vinegar with one-third of its volume of white pine pitch, also hot. This composition, it is said, will give a sure and certain result.

There are to-day no less than 600,000 cars in the United States, running over 90,000 miles of iron rails, and additional roads yearly spreading in all directions.

Good Health.

The Nature of a Cough.

A cough is an instinctive spasmodic effort of the lungs to expel the air which they contain, through their "pipes," or their bronchial branches, for the purpose of carrying before it, and out through the mouth, anything which is in the lungs or air passages, and which ought not to be there. It is a law of the animal economy to relieve itself; not the least of all the wonderful adaptations which infinite wisdom and benevolence has ordained for our preservation. The eye begins to water and wash out with tears the particle of dust or sand which offends it. The stomach revolts instantaneously at the presence of poison, and rejects it. The tongue repels anything placed upon it, that is not adapted to the well being of the system. And if the lunge were less vigilant, accumulations would take place from time to time, and they would eventually fill with solid substances, air could not enter and we would die. Cough is excited by putting a straw or feather or other offending substance in the ear; thus, if a person is asleep, and an insect were crawling in, the cough would arouse him.

Cough is the common attendant of consumptive disease. Although it does not imply that because a man has a cough he must necessarily have consumption, yet no one can have consumption without a cough, sooner or later, with extremely rare exceptions.

This cough is an effort of nature to remove from the lungs that which ought not to be there, that which is causing mischief, just as vomiting is an effort of nature to remove from the stomach that which, if permitted to remain longer, would cause increasing mischief. Therefore, to take medicine to repress cough is to counteract nature, and if persevered in, will always hasten death. Hence opium, paregoric, laudanum, morphine, or any other anodyne known to men, when taken day after day will inevitably and under all circumstances make death the more certain in all forms of consumptive disease, unless there is a physician in attendance to counteract their mischievous effects. And as every intelligent druggist knows that of all the patent or secret medicines sold for coughs, colds and consumption, there is not a single one that does not contain an opiate or anodyne in some shape or form, so they all fight against nature, derange her machinery, lock up the glands of the system, disorder the secretories, and therefore must prepare the way for a more certain decline and death. It is, therefore, suicidal to use them.—*Hall's Jour. of Health.*

Yellow Fever.—The medicinal rule is that an elevation of 4,000 feet above the level of the sea confers immunity from yellow fever.

Animalculæ and Disease.—Dr. Declat, of Paris, in a recent medical work which has excited much attention and criticism, argues that all diseases are due to the development, in or on the body, of animalculæ that are microscopic or invesable to the naked eye—that is, parasites—bearing an absoluto resemblence to the ferments that disorganize organic matter. This theory as applied to certain diseases is founded he says, on direct observation; to others, on striking analogies, and on all the other medical doctrines that have remained unexplained, save by the parasitic theory. Parasitism, he asserts, explains contagion, miasmatic influence, the action of viruses etc.; the ferment germs, floating in the air or placed in contact, in certain conditions with our organism, are developed in it and alter its functions; epidemic diseases are due to the invasion of animalculæ wide spread in the atmosphere; endemic diseases, intermittent fevers, yellow fever, typhoid fever, etc., are to be traced to centers of putrid fermentation, from which they derive their living germs, the parasites, and which are the cause of these affections; and that the proof of sporadic maladies being of parasitic origin is that many animals and vegetables are generated and developed at certain determined periods and places.

The Effect of Coffee.—Dr. Richardson, the eminent English scientist, in respect to the popular notion that coffee is an unhealthy beverage, that it keeps up a constant irritation of the stomach, and brings on depression of spirits, etc., says there is a great deal of truth in the idea, as coffee cannot be taken in excess without producing dyspepsia and irritation, but moderately used it is an invigorating, healthful and wholesome drink, bringing a man's best energies into play. The quantity taken, however, must not be large, and should be good. Dr. Bock, of Leipsic, another celebrated scientist, says: "The nervousness and peevishness of our times are chiefly attributable to tea and coffee; the digestive organs of confirmed coffee drinkers are in a state of chronic derangement, which reacts on the brain, producing fretful and lachrymose moods. Fine ladies addicted to strong coffee have a characteristic temper, which I might describe as a mania for acting the persecuted saint. Cocoa and chocolate are neutral in their psychic effects, and are really the most harmless of our fashionable drinks."

Near-Sightedness and Far-Sightedness.—Presbyopia, or what is commonly known as far-sightedness, is found to supervene earlier with those who are constantly at work than with other individuals, and, as soon as it does, convex glasses should be at once resorted to, without which the muscles of accomodation would be fatigued to no purpose. At first they should be used for working in the evening, after the fatigue of the day; but a long-sighted person should only use spectacles for looking at near objects, not at far ones. Work requiring close application favors the development of myopia, or near-sightedness, precisely in proportion as the conditions of illumination are bad, and, if the action of those causes continues the myopia must increase until vision is lost. If the eyes are fatigued by bad artificial illumination, blue or slightly smoked or smoke-colored glasses are useful, and in order to avoid the lateral rays, they should be large and round. In case of persistent irritation, all work should be abandoned, and an examination made to see if there be any disturbance of refraction, etc.

The Faculty of Attention.—In an article on "Mental Reflexes," in the London *Lancet*, Dr. J. Mortimer Granville says: "A frequent cause of failure in the faculty of the attention is striving to think of more than one thing at a time. It is, of course, impossible that the mind should be engaged with two topics at once. The expertness which seems to accomplish this feat is, in fact, a highly developed power of glancing from one subject to another with great rapidity—a sort of mental trapeze-flying, wherein the performer often gets an ugly fall, and may be permanently disabled. If he escapes this calamity there will probably come a time when he will discover that he has so impaired the power of application that he can scarcely follow a long sentence, or carry out a sustained process of reasoning. Those who are compelled by their daily avocations to practice this flying method of thought should for their own sakes, make it a rule to read, if possible, aloud—in any case attentively—a chapter or two of some sufficiently engrossing work at short intervals so as to cultivate the faculty of attention.

Diarrhœa in Hot Countries.—Dr. Talmy prescribes for the diarrhœa of hot countries from 20 to 300 grains of sugar of milk, daily. He administers it in the simplest way—the sugar, dissolved in a little water, as a draft in the course of the day. An excellent mode of administration consists in putting the dose of sugar of milk to be taken in a smaller or larger quantity of milk, according to the habits and digestive organs of the patient. The treatment is spread over several months, diminishing the dose as nutrition becomes more considerable and easier.

The doctors are after the electric light. They say it will eventually destroy the eyesight, and one medical man says he was blind for three days, the result of attending a concert in San Francisco in a hall supplied with the electric light. Edison has given us this eye destroyer, now let him give us invulnerable eyes.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Chlorination Vats for Gold Ores; The Maryland Mine; Geology and Human Development, 321. Superintendent's Statements, 324. This Week; Further About a Questionable Process; Arizona.—No. 4, 328. Another Mining Dredger; The Newcastle Mine; A California Scene; Indians and the Miners, 329. Notices of Recent Patents; Our Future, 332.

ILLUSTRATIONS.—Chlorination Vats 321. Twigs of the Larrea Mexicana and Deposits of Oum-Lac, 326. View on the Kern River, 329.

CORRESPONDENCE.—Tombstone District, 322. The New Departure in Pan Amalgamation, 329.

MISCELLANEOUS.—Prospective Processes; Micro-Mineralogy; Minaret District, 322. Shell-lac and Lac Dye; Base Ores; Mining in Bodie; Recent Decisions Relating to Patents, Etc., 326. Working Low-Grade Ores; Blind Mountain District; Eureka District; Tombstone District, 330.

MECHANICAL PROGRESS.—Locomotive Boilers—Iron vs. Steel; Naptha as Fuel for Locomotives; A Remarkable Plow; Friction and Traction; New Use for Sawdust; Fall of a Metallic Roof, 323.

SCIENTIFIC PROGRESS.—Theory of Light and Color; The Nature of Light and its Action Upon the Eye; Caloric Effect of Steam Boilers; Temperatures of Deep Water; White Fish Under the Microscope; Photography Under Water; Magnetic Writing, 323.

MINING STOCK MARKET.—Sales at the San Francisco, California and Pacific Stock Boards, Notices of Assessments, Meetings and Dividends, 324.

MINING SUMMARY from the various counties of California, Nevada, Arizona, Dakota, New Mexico and Utah, 324-325.

THE ENGINEER.—Ohio River Improvements—Movable Dam System; The Baltic and North Sea Ship Canal; A French Ship Canal at Home; The Sahara Railroad, 327.

USEFUL INFORMATION.—How to Use Cements; Are Cape Diamonds Real Gems? Lithographic Stones; How Slate Pencils are Made, 327.

GOOD HEALTH.—The Nature of a Cough; Animalcule and Disease; The Effect of Coffee; Near-Sightedness and Far-Sightedness; The Faculty of Attention, 327.

NEWS IN BRIEF on page 332 and other pages.

Business Announcements.

Dividend Notice—Black Bear Quartz M. Co.

Dividend Notice—Eureka Con. M. Co.
Audiphones—H. E. Mathews, S. F.

The Week.

The weather throughout the State has been warm and pleasant during the past week. In the mountain counties the vast accumulation of snow stored up during the winter, and augmented by the frequent and cold storms of March and April, will be melted by the warm sun and keep up the water supply in the streams for the use of miners. The loss of time occasioned by the extreme cold in the early part of the winter will be more than compensated for by the unusually large supply of water which will be available for mining purposes to a much later date than common. The River and Harbor Appropriation bill, which contains a number of appropriations for improvements on the Pacific coast, has passed the House of Representatives by a large majority.

A feature to which attention is called this week, in another column, is the beginning of the "sworn statement" system imposed upon mining superintendents by the Felton bill, which was passed during the recent session of the Legislature. This is the first time these statements have been made, and they take the place of the usual weekly letters.

Our mining exchanges continue to teem with accounts of strikes, purchases, bonds, discoveries, new districts, etc. The mining "boom" is in full blast all over the country. Scarcely a day passes but some important sale is made in the prominent camps. Prospectors are ranging over the mountains in all directions, and now that spring has opened, we may expect to hear of more wonderful discoveries from day to day.

THE Cassiar miners are beginning to start for that place. A steamer went up there last week, but could not proceed the entire distance.

THE House of Representatives has adopted a resolution to adjourn on the 31st of May.

Further About a Questionable Process.

Elsewhere in this issue of the PRESS will be found an article on the so-called Robinson process, prepared by Col. I. M. Taylor, a well-known mining expert of this city, and published in the New York *American Exchange*, from which we take it. This pretended process, though not lately introduced in the East, is not unfamiliar to the mining public of California, where its appearance was, with some blare of newspaper trumpets, announced and a great success claimed for it something over a year ago. Since then it has run its career and arrived at the goal invariably reached by similar pretentious devices on this coast, where the standing want of some more cheap and effective method of treating our debased ores exposes the mining community to be imposed upon by charlatans of this kind. Much was claimed for this Robinson process at the time of its first appearance in California, among other things that it was new, cheap, effective and capable of doing its work on large equally as well as on small lots of ore, all of which, it is needless to say, has been contradicted by subsequent experience. Credulous and tolerant, there were found here those ready to advance the necessary funds to give the thing a thorough trial. Small works were first erected, followed soon after by a larger establishment at Sacramento. A little later others were put up, first at Oakland, then at Grass Valley, and finally at Meadow Lake, at several points in Tuolumne and Amador counties, one over at Reno in the State of Nevada, and another even as far east as Idaho Springs in Colorado, experiments having been made at more than a dozen different localities with this simulated process before the summer was over. If it is in use at any of these places to-day we are ignorant of the fact.

The first party to look into this process and condemn it in a public way, was Col. Taylor, who about one year ago, after a careful examination of it, pointed out its utter worthlessness in a long communication on the subject, published in this journal at the time. This expose, coupled with the failures that afterwards attended every trial of the humbug, soon brought the thing to grief and, having entered it in the graveyard here kept for the reception of this class of remains, we consoled ourselves with the hope that we had heard the last of this empiric and his processes.

But in this reasonable expectation we are disappointed. The cadaver has, it appears, been resurrected, and is working further mischief in the East, where a company has been incorporated and is everywhere selling rights to use it. Finding it so resuscitated and at work, Col. Taylor, during a recent sojourn in New York, felt called upon to once more expose its want of merit, and caution the public against being taken in by it: hence this letter to the *Exchange* which we copy, believing all efforts at defeating the purposes of this new company to be in the line of journalistic duty and legitimate mining.

The fallacies of the Robinson process have been so fully and ably pointed out in the article referred to as to render further discussion of them superfluous. We therefore dismiss the subject, simply remarking that any application of heat, sufficient to drive off a portion of the sulphur, arsenic or other volatile element refractory ores may contain renders them correspondingly more docile and easy of further treatment. By raising sulphurets to a red heat, and while in this state precipitating them into water, a portion of their sulphur uniting with the water forms hydro-sulphuric acid. By some metallurgists it is claimed that through this treatment the ores are relieved of a greater amount of sulphur than they would be by allowing them to cool in air, and that through its employment a considerable saving in fuel and manipulation can be effected. Others, however, maintain that no such gains are effected, or, if any, that the difference is immaterial. Be this as it may, all are agreed that neither plan is wholly effectual, and that the only practical and thorough way of desulphurizing ores is by a continued roasting. This plan of heating ore and throwing it while hot into water was practiced by Mexicans in early days and is still more or less in vogue among them, its object being not so much to effect chemical changes as to render the gangue more friable and easily pulverized. It is a fact as old as mining itself and a good deal older than scientific mining, having been practiced in the most primitive stages of the business. It is the first thing that suggested itself to the barbaric mind when commencing to wrestle with the problem of ore reduction—it belongs to the age of the stone ax and hammer—it is the *process of the savage*.

COPPER IN LIVERPOOL.—Latest quotations for copper in Liverpool, according to James Lewis & Sons report, are as follows: Bars, good ordinary brands, £60 5s to £60 10s; special brands, £60 10s to £60 15s; ore, 12s to 13s per unit; regulus, 13s to 13s 3d per unit. The market has had a downward tendency. Stocks of West Coast produce on May 1st were 33,036 tons fine, against 33,000 tons on 1st ult.

The State Board of Equalization have assessed the total value of the Southern Pacific railroad within this State at $10,483,518. This valuation is divided pro rata among counties through which the line passes, according to the mileage in each county, the rate per mile being $14,733.

Arizona.—No. 4.

Geography.

The area of Arizona is given at 113,915 square miles, or a little larger than the whole of the British Isles, and nearly equal to the whole of the New England States plus New York. From its northern boundary, 37° north latitude, to its southern, its length is about 394 miles, while its greatest width, from nearly 109° to about 114° 50′ west longitude, is above 370 miles. Without sea-coast, with only one navigable river, the Colorado, and destitute of prairies, or of far-stretching forests of good timber, Arizona would be of little importance were it not for the minerals hidden in its mountain masses, especially along the central axis of the Territory.

But the development of the mineral wealth gives value to every spot that can be cultivated, and invites to the employment of irrigation for the reclamation of broad areas that need water only to render them fertile.

The most natural subdivision of Arizona is into a northeastern and northern region of plateau several thousand feet above the sea; a central broad mountain belt formed of short confused ranges, the interlacing of the Rocky mountains, Sierras and Mexican Cordilleras, whose peaks do not, as a rule, attain elevations equal to those found north and south of the Territory, and a southwestern region of comparatively low-lying arid plains, from which short mountain ranges rise suddenly, without intervening foothills.

Parallel with the Colorado for some distance south of its southerly bend lie the Black mountains, and nearly parallel with these, to the east, run the Cerbat range, continued southward by the Hualapai and the Music, Cottonwood and the Aquarices ranges.

Between the Cerbat range on the west, and the Music and Cottonwood ranges lies the broad Hualapai valley; and between the Black mountains and the Cerbat range is the Sacramento valley.

West of the Hualapais, and running east and west across the Colorado, which cuts through it at Mohave canyon, is the Mohave range.

In the district occupied by the previously mentioned mountains and their intervening valleys lie the San Francisco, Hualapai, Maynard, Cedar Valley and Greenwood mining districts.

East of these ranges lie the Mount Hope, Juniper and Santa Maria mountains, on which few mines are yet developed.

South of Prescott, and around the headwaters of Hassayampa and Agua Fria creeks, lies a wilderness of short ranges, around and among which are located some of the most flourishing mining districts of Arizona.

Chief among these are the Bradshaw mountains, trending southwest and northeast, with the Weaver mountains parallel to them, and the Date Creek mountains at right angles with them.

The Black hills and Verde mountains, west of the Rio Verde, the Mazatzal mountains between the latter and Tonto creek, and the Sierra Ancha, between the latter and Cherry creek, have not yet been entered to any considerable extent by miners, but it is thought that ultimately the Tonto basin will be found to contain some of Arizona's greatest riches.

South of Salt river, the Salt river and Apache mountains have a general east and west direction, while the Superstition mountains, inclining to the south, overlook the southwestern plains. In this region lie the Globe, Pioneer, Mineral, Summit, Pinal and Randolf mining districts.

To the northeast of the mountains of the Salt River district, and between the sources of the latter and those of the Little Colorado, lie the White mountains, the loftiest peak of which, Mt. Thomas, is 11,496 feet high.

Continuing the line of these mountains in a northwest direction, and rising high above the level of the plateau, which itself is some 5,000 feet above sea level, are the Mogollon mountains.

Northwest again of these, at the headwaters of Cataract creek, and surrounded by the great Colorado plateau, the short range of the San Francisco mountains rises into several lofty peaks, the highest of which, Humphreys peak, attains 12,501 feet above the sea.

East of the Salt River mining district, south of the White mountains, and north of the Gila, lie the Gila range and the Sierra de la Petahaya, enclosing between themselves and the White mountains the Prieto plateau and Prieto Park, while south of the Gila, and running usually in a southeast and northwest direction, are successively, commencing on the east, the Peloncillo, Pinaleno and Chiricahua, Galiuro and Santa Caterina ranges; and northward of the last, between it and the Gila, the Tortilla and Tortillita mountains overlooking the plains of southwestern Arizona.

Between the Peloncillos and the Pinalenosis is San Simon valley, and between the Peloncillo range and the Galiuro mountains is Grass valley, watered by Arivaypa creek, a branch of the Rio Pedro, which it joins by a canyon through the Galiuros.

The mineral riches of all these ranges, occupying the larger portion of southeastern Arizona, have only recently excited attention. Before reaching the valley between the Galiuros and the Santa Catarinas, the San Pedro passes between the Mule Pass and Dragoon mountains on the west, and the Huachuca and Whetstone mountains on the east; through a region now known to be one of the richest in the precious metals that rich Arizona can show.

Here, between the Dragoons and the Rio Pedro, is the now famous Tombstone district, already one of the chief centers of population, and southwest of it the Huachuca district.

South of Tucson and west of the Huachucas, in the district watered by the Santa Cruz and its tributaries, are the Mustang, Santa Rita, Patagonia, Atascoso, Cayetano and other short ranges. Among these are situated the oldest mines in Arizona—mines known and worked long before the Anglo-Saxon trod upon the soil, and even now among the most productive in the Territory. Here are the Tyndall, Aztec, Patagonia, Arivaca and Oro Blanco districts, with several small towns and a constantly increasing population.

The Colorado and its Great Canyons.

The principal and only navigable river, the Colorado, runs almost due west for some distance after its entrance into the Territory, crossing its northwestern angle, and cutting off the Kaibab, Sanup, Kanab and Sheavwitz plateaus, and the Antelops plains from the west of Arizona. For the greater portion of this distance the river flows in the depths of a canyon, the most remarkable, longest and deepest in the world. The principal portion of this is known as the Grand canyon, and above it are the Marbles and other canyons.

Near the confluence of the Grand Wash from the north the Colorado becomes the boundary between this Territory and Nevada, and, after passing through Iceberg and Boulder canyons, turns abruptly southward, and flows in this direction to the gulf of California, forming the western boundary of Arizona.

The wonders of this vast system of canyons, draining the land of all moisture, extending laterally for long distances along tributary streams and cutting up the entire country into a series of plateaus separated by deep water-worn excavations, the walls of which are from 3,000 to 6,000 feet in height, have been set forth in glowing terms by Lieut. Ives who explored its lower portion, and more recently by Major Powell, whose thrilling account of his descent of the river from the commencement of the canyon system to its termination will be fresh in the memory of our readers.

Below Boulder canyon is Black canyon, below which, except in the Mohave and Cane-brake canyons, the river flows mainly in a comparatively wide valley.

From the end of Black canyon to Fort Yuma the distance, in a straight line, is about 220 miles; and from Fort Yuma to Point Isabel, at the head of the gulf of California, is about 120 miles, of which about 60 are tide water.

The valley of the lower Colorado is exceedingly fertile, and naturally grows an abundance of mesquit, cottonwood and willow. Much of it is over-flowed by summer rains and freshets, so that it lies under somewhat similar conditions to the valley of the Nile, the narrow river bottom of which even now supports a population equal to that of the whole Pacific slope. It is said that on this bottom corn, beans and barley have matured and been gathered, in from 80 to 90 days. The Colorado in its lower course is exceedingly changeable, so that land that is at one time in California may be shifted into Arizona by the fickle river.

Bullion Shipments.*

Since our last issue, we have noticed the following bullion shipments:

Hillside, May 12th, $550; Ivanpah, May 12th, $6,011; Northern Belle, May 10th, $6,286.08; Bulwer Con., May 10th, $9,698.54; Standard Con., May 10th, $47,080.93; Northern Belle, May 12th, $6,432.54; Hillside, May 17th, $3,000; Christy M. Co., May 17th, $5,939; Grand Prize, May 7th, $23,338; Paradise Valley, May 7th, $3,182; on 17th, $4,446; Bullion, May 17th, $911.24; Wells Fargo, May 7th, $27,000; Contention, May 8th, $4,860; 11th, $7,116.69; 13th, $4,129.51; Tombstone, May 8th, $4,860; 11th, $12,161.32; 13th, $3,326.12; Richmond, May 10th, $17,977.41.

*Desiring to make our list of Bullion Shipments as complete as possible, we will be thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

THE MARYSVILLE FOUNDRY.—The Marysville foundry, which has in times past done a great deal of quartz mill work which has been very satisfactory in its character, is about extending its facilities for mining machinery and other work. Mr. H. J. Booth has, we understand, gone up to Marysville, and will hereafter, with Mr. Eckhart, give closer personal attention to the foundry. Considerable mining machinery has been sent south from the foundry of late. They are now building a 10-stamp mill with 20-horse power engine and boiler, for the Real del Castille M. Co. in southern California. This is a silver mill and will have a complete outfit of pans, settlers, etc. They are also building a fine 10-stamp mill for the Brown's Valley mine of Frank & Rule. A 20-stamp mill will soon be built for the Banner mine, above Oroville, formerly the old Smith & Parks mine.

THE daily receipts of the Government for the present month, had averaged more than $1,000,000.

The New Departure in Pan Amalgamation.

[Written for the MINING AND SCIENTIFIC PRESS by C. H. AARON.]

It is now a good number of years since I stated, as the result of experiments made in Mexico, that, in working roasted silver ore in pans, no advantage was gained by grinding, provided of course that the ore was not sintered in the roasting. On the contrary, the only effect seemed to be that my bullion was baser. This opinion was confirmed by other observers.

Within the last few years the practice has been gaining ground of amalgamating also unroasted silver ore without grinding in the pans. The ore is crushed to the required fineness in the battery, then worked in the pans with the mullers raised.

The rationale of the matter is probably this: In roasted ore nearly all the silver is in the form of chloride, and, as such, is soluble in the warm pulp, which always contains salt and base metal chlorides more or less. In this condition it is readily metallized by contact with an iron surface, or even by a surface of quicksilver and amalgam adhering to iron.

When the pan is worked with the muller grinding, the surfaces of shoes and dies are kept bright, no amalgam can adhere to them; a large portion of the silver chloride is metallized by them *out of contact with quicksilver*, and the silver thus reduced, in a condition of infinitesimal fineness, becomes mixed with the mud, and is thereafter hard to catch. Also, the base metal salts in the ore, some of which, as for example lead sulphate, being hardly soluble in the pulp, would be very slowly reduced to metal by an amalgamated iron surface with little friction, are rapidly metallized by contact with clean iron aided by heavy friction, and thus produce base amalgam.

Quicksilver has itself the power to slowly metallize silver chloride by abstracting its chlorine, itself becoming converted into calomel, but it has no power to metallize base chlorides. A clean iron surface metallizes both silver chloride and base chlorides with great rapidity, and although silver being more negative to iron than copper or lead, would be reduced from the state of chloride first, or at least fastest, when present in considerable quantity, yet, when the base metal salts are in great excess, the result is that both are reduced together.

Silver chloride has the power of redissolving copper or lead which has been reduced by the iron surface, because copper and lead are more "positive" to chlorine than silver is, but in presence of the still more positive iron the base metals are reduced too fast to be so redissolved, especially as the quantity of silver chloride in the pulp is continually becoming less as the operation proceeds.

If the amalgam which is forming in a grinding pan be examined at an early stage of the work it will be found quite crisp, indicating great purity, proving that the silver chloride, while tolerably abundant in the pulp, is reduced fastest; but to stop at this stage would leave too much of it undecomposed, and the amalgam will be found to become more and more base as the work goes on.

The particles of iron removed from the grinding surfaces by abrasion also contribute to the rapid reduction of the chlorides, and though they, as well as the copper and lead produced by them, do in part effect the metallization of silver chloride, yet the silver so produced, like that from the clean shoes and dies, is liable, more or less, to escape amalgamation.

In contact with iron, the reducing power of quicksilver is increased by galvanic action, so that it not only metallizes silver chloride more rapidly and without making calomel, but becomes also capable of reducing the base chlorides, yet not so rapidly as does iron itself. When, therefore, in working roasted ore, the muller is kept raised, and the surfaces of shoes and dies, instead of being brightened by scouring, become covered with a coating of quicksilver, which adheres in consequence of a film of silver, copper, or lead which forms upon the iron, the silver chloride, dissolving in the warm, salt pulp, is metallized as fast, or nearly so, as by direct contact with iron, there are no particles of iron floating in the pulp, and the silver, being reduced *in contact with quicksilver*, is amalgamated in the same instant, while the base metals are reduced more slowly than when grinding. It is a well-known fact that finer bullion is got in barrels with scrap iron than in grinding pans.

I will remark in passing, as a good deal has been said of late about refining base amalgam, that it may be done very simply by working it in a barrel with some roasted silver ore, when the base metal will be extracted from the amalgam at the same time that a portion of silver is extracted from the ore. When the amalgam is fine enough it must be removed, or calomel will be formed. The working of the pulp from the barrel can then be finished in a pan.

In working unroasted ores in pans without grinding, there is another circumstance which contributes to the result, which is that bluestone and salt are commonly used, making copper chloride by double decomposition, which acts by converting the silver in the ore into chloride, that is, chloridizes by boiling, so to speak, instead of roasting. This being the object and effect of bluestone and salt, or copper chloride, it is desirable, in order to get as much benefit as possible from it, to prevent as long as possible its decomposition by the iron pan, and this result is best attained by the avoidance of grinding, for the reasons set forth in speaking of roasted ors.

The best practice then in working raw ore in pans by the aid of chemicals, is to crush very fine in the battery, and work afterward in the pan with the muller raised sufficiently to avoid rubbing, while still low enough to insure contact of all the pulp with quicksilver.

In the case of gold being also present, and not yielding well, I will suggest as an experiment worth trying, that the ore be worked first for silver in the manner described, and then by grinding in the same or another pan, with addition of soda or lime, and perhaps potassium cyanide, for gold. The alkali will prevent the copper and lead from amalgamating, but is not believed to be injurious to the gold.

Note.—Perhaps I lay too much stress on the reduction of the silver in contact with quicksilver. I worked, many years ago, the first charge of roasted silver ore that was ever worked in a Beaux and Guiot pan, the construction of which was such that the quicksilver was not mixed with the pulp, nor distributed over the bottom, but was confined to a groove surrounding the grinding surface. The result was excellent. Also I know of cases in which the roasted ore was ground in one pan and amalgamated in another with good results; but the same experiment with raw ore was a failure, though it must be admitted that the pan used for the amalgamation was a very poor one for the purpose under the circumstances, being a Knox or Wakelee of the old style. Still, I think the point is of some importance, especially when much clay or slime is present.

Another Mining "Dredger."

We see by the *Mountain Messenger*, of Sierra county, that some gentlemen propose to put another mining boat on Feather river. They say they have hundreds of thousands to invest in it. So many attempts have been made to realize fortunes from the sands in the bottom of the rivers of this State, by means of pumps, vacuum engines, and similar devices, all of which have failed, that we thought for the present there would be no more attempts in that line. It seems not, however. We do not know any thing about the details of the new "mining boat," or the means by which the golden sands are to be sifted and washed, but on general principles we have doubts about any scheme of that nature succeeding.

Sands and tailings which have been once washed and deposited in the beds of rivers, if again handled, must be taken in such immense quantities, that any process dependent upon machinery for lifting them from their beds, will, in all probability fail. If they are in such a position that they can be directed by water and flumes, etc., where they can be washed, it is all very well. But lifting them ton by ton and working them over, will scarcely pay unless they are very rich.

Even before any attempts of this kind were made in our rivers, similar schemes were carried out on the ocean beaches of the Gold Bluffs. Mining pumps and dredging appliances of different kinds all proved failures. While sand on the beach itself paid, that which was supposed to be concentrated, outside the surf, would not pay.

In the river claims, where dredging and pumping boats have been employed, failure after failure has occurred. Some little gold has been taken out, but it usually cost from $5 to $10 to take out one dollar. This experience has happened to so many that it would seem as if strangers would inquire into the reasons very carefully before undertaking similar enterprises. The failure is always laid to the machinery. Of course it is the machinery; but any kind of machinery for lifting and handling the debris, or the sands, will cause such an expense in proportion to the amount yielded by the sands, as to render the enterprise a failure. Simplifying the machinery will be of very little avail in the general result. However, each new experimenter will serve as a warning post to the next man, and the more prominent the failure the better chance there is of others being deterred from following in the same footsteps.

The Newcastle Mine.

With the revival of mining in the last few months, the lower foothills are receiving considerable attention, and a number of valuable properties are being developed. In early days, in these lower hills and ravines were some of the richest placer diggings in the State, but their large banks of deep gravels have been but little worked, except by drifting on the bedrock, hydraulicing being in the main impracticable, owing to lack of head for the water and dump for the tailings. The surface placers were long since worked out, and the comparatively little mining of recent years, principally rewashing of tailings, has been done almost entirely by Chinamen. In some instances, where a sufficient head of water is obtainable, Cranston's hydraulic machine is employed very successfully.

A few months since capitalists purchased what is known as the Yankee Hill claim, located about two miles from Pino, in Placer county, and incorporating as the Newcastle mining company, commenced active operations at once. Their ground consists of 120 acres, 90 acres of which are covered with gravel from 30 to 100 feet deep, the whole averaging about 60 feet. The bedrock is granite, the surface of which is very much decomposed and eroded. The gravel is easily piped and washed, no pipe clay and but little cement being present. The latter is principally decomposed granite sand and is easily broken up. The gold is fine, but is found distributed through the entire mass of the gravel, and careful prospecting seems to indicate the average richness of the latter, where piping is at present going on, to be from 30 to 40 cents to the cubic yard. The water is taken from the Bear River ditch, three miles distant, and conducted to the sand box. From thence, two miles of 22-inch pipes, with a maximum capacity of 1,200 inches, bring it to the mine under a head of 120 feet. One No. 2 giant, throwing 260 inches, is used at present for piping, but the distributer is arranged for three giants, which can be put on when desired. Four hundred feet of 2½-foot sluice-boxes and one undercurrent constructed in the most thorough and substantial manner, discharge the tailings into Kidd's ravine, in which they are dammed and backed up for several hundred yards, to be subsequently rewashed after slacking for a year or two. The mine has been opened and fitted up under the supervision of Mr. Charles E. Allen, the president and superintendent of the company.

VIEW ON THE KERN RIVER.—(A. Bierstadt.)

A California Scene.

We give on this page an excellent reproduction of a choice painting, representing a fraction of the grand and beautiful as embodied in California natural scenery. The view combines the majesty of the mountains with the quiet beauty of the riverside; its quiet disturbed only by the wild life natural to our unfrequented districts. The view is on Kern river, one of the most notable of the Southern California streams. In an article recently published, the *Pacific Press* gives a characteristic sketch of the river and its course:

Kern river, or *Rio Bravo* as formerly called by the Mexicans, is a topographical exemplification of the course of but too many of earth's high horn sons. In its early stages we find it a lovely little stream, rising in the region of Mt. Brewer and coursing south among some of the grandest scenery of the Sierras, passing on its way Mt. Williamson, Mt. Tyndall, Mt. Whitney and Mt. Agassiz, whose snow-capped peaks rise between 14,000 and 15,000 feet into the bluest of western skies, and whose waters pay tribute to the clear water of *Rio Bravo*. It is here among these grand old giants that Mr. A. Bierstadt, our celebrated national painter, has selected the subject of one of his works of art, the which our engraver has so well succeeded in copying. Here where we see the grand and sublime united with the mild and lovely we have indeed a combination well worthy the brush of the painter, or the pen of the poet.

Following its course still further down we find it leaving the mountains and entering among the rolling hills from whence it emerges into the heated and alkaline valley of the San Joaquin. For many miles it carries with it along its shores traces of its former loveliness, but gradually its waters become dark and muddy; it forms sloughs and miasmatic marshes, and its waters degenerate from pure and life-giving to fever and death-bearing.

It opens up, it is true, a large agricultural district, and much land that would otherwise be barren waste is made to produce abundantly by means of irrigation; hence many are induced to settle in this region where they may utilize its waters, but we think many who do so have reason sooner or later to regret their choice of location, more particularly, however, on account of its unhealthfulness, than for other reasons. The greater part of its waters finally empty into Goose lake, though much of it sinks in sloughs and a part finds its way into Kern lake. The region in which it rises is remarkable for its loveliness, but step by step it descends in its course of dissipation until it ignominiously comes to its end in Goose lake.

Indians and the Miners.

The mining "boom" is bad for the Indians. The white men are bound to invade the reservations, if within the boundaries there is the least chance for finding gold or silver. This has been the case heretofore, and will be again. The Gunnison country, where the excitement is expected this summer, is on Indian ground, but this has not deterred the prospectors from going in. The results so far have been, however, disastrous. The Chicago *Times* of the 15th publishes a story from Leadville, told by John Allendorf, to a reporter in that city, regarding the terrible massacre of white prospectors en route to the reservation. Allendorf says that he left his home in Linn county, Kansas, seven weeks ago, with 17 others, equipped for an expedition in search of mineral, which they found on the headwaters of Gunnison river, in rich placers, which yielded from $2,000 to $4,000 per day. On May 3d, while the party was widely scattered, Indians, mounted, and 500 strong, galloped down upon the camp and massacred the whole party, cutting their bodies into pieces. Allendorf witnessed the affair from a mountain, whither he had gone hunting. The Utes had carried off all the gold and the whole outfit. Allendorf escaped, and walked for several days, until he reached a settlement.

Telegrams received at Leadville report that men coming from the reservation to Lake City report a party of 25 prospectors corralled on the Gunnison, and 12 killed. This is supposed to be Bradbury's party, which left Del Norte three weeks ago.

Dispatches for Los Pinos Agency, Colorado, of the 18th, say: The reported massacre by the White River Utes of Bradbury's party of prospectors from Del Norte is disbelieved. Chief Ouray has no confirmation. Acting Agent Sherman, under orders from the Department, and at Ouray's request, followed the party nine miles up the North Fork of the Gunnison, to warn them off the reservation and of the danger they were incurring. He found it impossible to overtake them, as they were evidently making marches for Eagle river. Several days previous to his arrival at their abandoned camp, at the junction of the waters of Eagle and Gunnison rivers, a parley of some kind occurred, as the Indians report that Bradbury claimed them to be Mormons bound for Utah, though traveling in an opposite direction. Dr. McKenzie's scout (Gibson) is here, but does not report any forward movement of troops. The Gunnison country is swarming with prospectors.

Working Low-Grade Ores.

There is considerable talk here on the Comstock now of commencing the reduction of some of the millions of tons of low-grade ores which have been left in the vein at various levels nearer the surface than where explorations are now being made. Mining men say this can be done and a profit realized provided the expenses of mining and milling can be reduced a little. They do not propose to raise any opposition to the Miners' Union, as they know very well that no country can be truly prosperous unless the laboring classes are well paid for their services. The plan talked of is to allow the Miners' Union to continue the control of all men put into the upper workings, but that these men shall be allowed to labor where the mines are cool and above a certain level at a certain reduction from $4 per day. This would still leave the control of everything in the hands of the unions, because their own men would of course report at once any violation of the agreement looking toward a reduction of wages generally in the mines. This it is thought will entirely do away with the "entering wedge" argument, and show that the mining men of the Comstock have no disposition to reduce the wages of those who go into the heat of the mines and do the work in the lower levels.

Conversations have been held with many of the biggest mining men of the Comstock and all agree that the man who endures the heat and dangers of the lower levels and works there is fully entitled to his $4 per day, and that $4 is none too much. If, however, men could under these restrictions be allowed to work above in the manner prescribed and with no danger to the unions and to the general prosperity of the Comstock, a new industry would no doubt be inaugurated in the mining and milling of low-grade ores.

It might, however, be also necessary that wood and other supplies should be obtained at lower rates in order to make the industry remunerative. It does not seem to be a proposition that the workingmen of the Comstock should make all the sacrifices necessary to inaugurate this work. Wood can be had in abundance at Truckee for $3 per cord. It should be delivered to the mines for less than the $10 now paid. Let the railroad yield a little as well as the laborers and thus come in for a fair share of the credit of opening a new field of labor and promoting the general prosperity of this section.

If the foregoing plan of co-operation can be agreed upon there is but little doubt but that the work will be commenced. Then, if it costs $1,000 to take out $1,000 the country is a thousand dollars richer, for that amount will have been added to the gold and silver in existence and men will be given something to do, a consideration of some consequence as things now are among us.

Some have intimated that the miners' unions have been agitating this matter themselves, and are favorable to the plan, provided they can be satisfied that it does not cover an intention to reduce wages in the mines.—*Gold Hill News.*

Blind Mountain District.

This district has of late been attracting considerable attention among prospectors and during the past few months a great deal of work has been done upon the different claims. Some years ago Blind Mountain was well thought of on account of the rich ore that lay near the surface. A district was formed, claims located, and a large amount of ore, ranging all the way from $200 to $400 per ton, was shipped to Eureka at heavy expense, as it was base and could not be milled. Soon after the excitement died out, and with the exception of the yearly assessment work, the different mines lay dormant until some few months ago, when the Midnight was taken hold of, and after some work a large body of high grade ore was uncovered and shipped to Bristol, netting for its owners the sum of nearly $8,000 as the result of two months work. The main shaft of the Midnight mine is now down 131 feet and in the bottom a totally different character of ore has been encountered the past week, carrying a good deal of sulphurets and giving sample assays running up in the thousands. There is now twenty tons of ore on the dump ready for shipment which will net from $150 to $200 per ton.

In the Thorndyke, adjoining the Midnight, a depth of over 135 feet has been attained, and numerous drifts and cross-cuts have been run to strike the ledge. At present work is being done sinking on the new strike, about twenty-five feet south of the main shaft, which is looking exceedingly well. Shipments of ore will commence to Bristol upon the starting up of the Hillside furnace. Farther up the mountain is located the Bristol, an immense ledge traceable for miles, the property of Messrs. Howell and Sheridan, a contact of ore from eight to twelve feet in width, laying between slate and lime. A shaft fifty-six feet was sunk off the ledge, with the expectation of catching it on the dip, but the ledge was found to have a break which necessitated a drift of about fifty feet to strike it. The drift is now being driven through hard slate and is in forty feet, with every appearance of mineral ahead. Operations will soon be resumed upon the Kenebec and other mines, and from present indications it will not be long before Blind Mountain will be enrolled as a paying district.—*Pioche Record.*

Eureka District.

The *Sentinel* desires to direct the attention of its Eastern readers to a few indisputable facts:

First—We assert that Eureka is the most extensive mining field in the world. Its mineral zone has a length of eight miles by from one to four in width. There is scarcely any part of this vast area that is not mineral bearing, in the sense that constitute a promising outlook for a paying mine.

Secondly—It may be stated, as conclusive proof of the great extent of our mineral bearing territory, that the records of the District Mining Recorder's office shows the location of *more than two thousand mining claims* in ten years. There are nearly two hundred mines in the district for which U. S. patents have been obtained.

Third—Two of our leading mines have paid dividends consecutively, for a greater length of time than any other two mines in America. They are still paying, and will continue to pay right along indefinitely.

Fourth—There are five hundred partially developed mines here that can be had for less money, according to prospective valne, than at any other point in the United States. A small sum as purchase money and a little more for development, guarantees the investor a paying property, and possibly a honanza with "millions in it," in a few months.

Fifth—The total hullion output of Eureka district aggregates over $60,000,000. Many of these millions were obtained from the partially developed properties we have been talking about.

Sixth—We have a good climate, pleasant surroundings, and rail connection with the outside world.

Seventh—If you want to embark in safe, legitimate and profitable mining, at small cost, Eureka is your place.

Tombstone District.

The leading mines of this place are more than coming up to all that was expected of them. The Charlestou mills send out their regular quota of silver bars, now averaging about $80-000 per month, and the Contention mill an equal amount; thus making $160,000 per month from the two mines—the Tough Nut and the Contention. At this rate it will aggregate about two millions per annum from the two mines with their mills, at present capacity. But these mills will he enlarged or other ones built, for the output of the Tough Nut will more than supply double all the stamps now dropping in the district, and shortly the Sunset, Grand Central, Empire, Prompter, Head Center, Randolph, Ajax and other mines will have mills, and as these mines produce an abundance of ore equally as rich as that now being milled, I cannot well see how the annual yield of hullion from Tombstone alone can fall as low as $10,000,000. In fact there is to he a "boom" here very soon that will out-boom everybody else's boom. Besides mills, we are soon to have more steam hoisting works than all the rest of Arizona combined. There are now seven of them here and more coming.—*Cor. Arizona Citizen.*

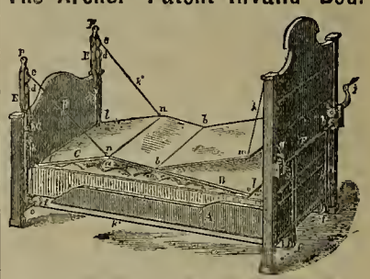
The Archer Patent Invalid Bed.



By simple mechanical attachments the Bed may be elevated, tilted, or adjusted to accommodate the invalid.
For full particulars see Mining and Scientific Press December 27th, 1879.
The adjustable bed bottom is put on top of the mattress, and by means of noiselessly operating cords and pulleys the patient may be put in any desired position.
The bed is adapted for persons in good health who wish an easy position, as well as it is for invalids.
This bed is of the latest improved form, with a view to simplicity, convenience and ease to the occupant.
A limited number of State and County Rights for sale.
Orders for the Patent Bed can be filled immediately.
Satisfaction will be given to those desiring to interest themselves in the manufacture or sale of this article.

Ingersoll Rock Drills.

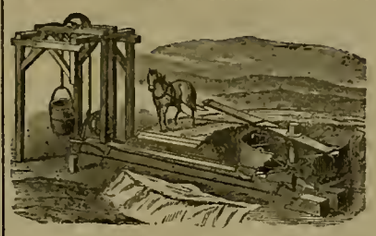
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

REYNOLDS & RIX, 49 Fremont Street, San Francisco.

SHEET IRON PIPE.

FRANCIS SMITH & CO.,

Manufacturers of

THE PATENT CHANNEL IRON WHEELBARROWS.

THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.

SHEET IRON PIPE.

Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe.
Also, Galvanized Iron Boilers, from 25 to 100 Gallons.

Iron Cut, Punched, and Formed for making Pips on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.

Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

Acknowledgement and Thanks.

SAN LORENZO, December 6th, 1877.

MESSRS. DEWEY & CO.—*Gentlemen:* I received the Letters Patent for my invention on the 5th inst., and beg to thank you for the gentlemanly and business-like manner in which you have dealt with me from the beginning of my application. I shall always feel it a pleasure to recommend you to all I come in contact with who need Letters Patent. Respectfully, WM. DALE.

A Card from Architects.

The California Architect and Building Review.

Office, No. 240 Montgomery Street, San Francisco, Cal.

It is with pleasure that we publish the following from prominent Architects in this city:
Believing that a journal of its kind is a necessity on this coast, and judging from what has appeared in the "Quarterly Architectural Review," we are led to believe that the CALIFORNIA ARCHITECT AND BUILDING REVIEW will be worthy of generous support and encouragement. We therefore pledge our cordial sympathies, personally, and hope that the enterprise will receive kindly recognition and liberal support from all Architects and Builders and the public generally. (Signed) David Farquharson, Wright & Sanders, S. H. Williams, Thos. J. Welsh, P. Huerne, John Marquis, B. McDougal & Son, Wm. Mooser, Wm. Curlett, Mecker & Banks, W. C. Hoagland, S. & J. Newsom, B. Henrickson.

LOVELY SEA SHELLS.

California Sea Shells and Mosses.

I will send to any address collections of Sea Shells in 10, 20, 30 and 50-cent packages. Also, collections of most exquisite Sea Mosses for pressing and making wreaths and crosses for framing. Price, 25 cents per box. Stamps taken. Address FLORENCE PERCY, Cordero Valley, San Diego County, Cal.

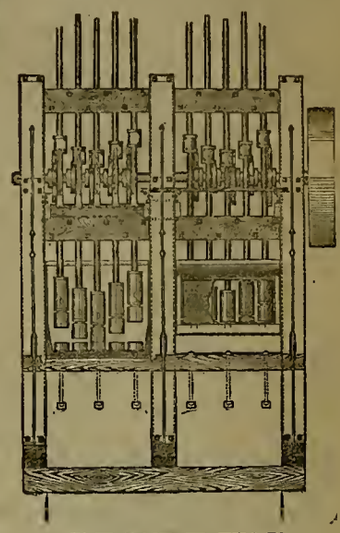
Mining Books.

Orders for Mining and Scientific Books in general will be supplied through this office at published rates.

Machinery.

GOLD AND SILVER
Grinding and Amalgamating MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S
Wrought-Iron Frame
FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.
We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,550.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

Office, No. 320 Sansome street, Room 10.

NOW READY!

OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.

GRIMSHAW on SAWS!

History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.

By ROBERT GRIMSHAW, Ph. D., M. E.,

Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of all U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed
Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid.

ROBERT GRIMSHAW,
624, 626 and 628 Market Street, Philadelphia.
March 10 1880.

PATENTS AND INVENTIONS.

List of U. S. Patents for Pacific Coast Inventors.

From Official Reports for the "Mining and Scientific Press," Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

CENTRAL DRAFT FOR PLOWS.—Louis Begon, San Francisco. Patent No. 227,406. May 11, 1880: The object of this invention is to apply the power used for plowing direct to the center of resistance on the mold board, instead of decomposing said power, as is done at present, in order to resist the pressure of the earth upon the mold board. A plow may be conceived as being a compound and combination of two wedges, one advancing horizontally and raising the furrow slice, while the other, being placed laterally along the beam, throws or shifts said slice usually to the right of the plowman. As the plow advances it is struck by the earth, and a part of the effect of the same being to throw the plow sidewise toward the plowman. To obviate that side pressure the horses are usually hitched up at a point on the regulator, instead of at the end of the beam, and so their united strength is decomposed, and a part of it used to push the end of the beam sidewise to the left in order to balance the side pressure on the mold board; but for such an offset to take place there must be a fulcrum on the other side of the plow. The plow having to be pulled through these opposed pressures, requires more power than it would if the power could be applied more directly at a point on the center of resistance. In this invention an additional beam is employed, which is provided with a strong iron curved standard. Said standard is applied to the back side of mold board, and thus has just the same relative resistance as that of the handle of a common pick or rake.

SCREW PROPELLER.—John B. Ward, San Francisco. Patented April 13, 1880. No. 226,466. This device consists in the employment of a peculiarly formed elastic blade, which is united to the hub, upon which are formed flanges upon the arc of a circle, so as to give the greatest strength at this point. These blades are formed circular, but are with a straight line face, and of a substance of an elastic nature, the outer edge being in the arc of a circle, so as to increase the efficiency of the blade. This form gives the greatest area with the least circumference, and hence the greatest strength for a given surface or gripe. It further relates to certain details of construction in the matter of the point of junction of the blade and hub-flange.

STAIRWAY ELEVATOR.—John I. Tay, Oakland, Cal. Patented May 11, 1880. No. 227,459. This elevator consists in placing at one side of the staircase in convenient position, a small tramway upon which travels a light, peculiarly constructed car, so arranged and connected hy cords with weights, that a person stepping upon the car, may, hy turning handwheels, at little expenditure of power, propel the car up or down as the case may be. Suitable arrangements are made for properly counterbalancing the car; for drawing it either up or down empty to the position of the person desiring to use it; and for the application of a brake for the prevention of accidents.

PLOW.—Louis Bsgon, Sau Francisco. Patented May 11, 1880. No. 227,405. This invention consists in a novel construction of the mold-board of plows, whereby the furrow-slices are turned over and lay in the manner best adapted to the beet plowing. It relates to the geometrical design of the mold- board or plow proper, and not to the beams or handles.

AN outbreak of the San Carlos Indiane, in Arizona, is reported, but the story of the hostiles ou the war path and the fleeing settlers, has no foundation, and appeare to be an exaggeration of one of the incidents of the troubles in New Mexico, located in a place where the first etory had been told. The agent of the Sau Carlos reservation ie a very careful and conscientious officer, and fully understands the importance of kecping a strict watch over his warde. His arrangemeuts for kseping himself informed are perfect, and no considerable number could be away for half a day without the fact coming to his notice.

Our Future.

The coming census will afford data for the thoughtful and curious who wish to speculate on the future prospects and expectations in store for the people of this alrsady grsat country. Nations as well as individuals look to the future and its bright hopss for no small measure of the valus which ths prssent affords them. But as nations continue, whils individuals drop out, its ultimate destiny will ever remain a propsr nbject for speculation and inquiry. Future expectations are gsnerally hased upon past experiences as the safest if not the only guides. This nation's future lies with the coming ages, but we of the present are equally interested in viewing its prospects with hopeful minds. The aspirations of youth ars strengthened hy hright prospects ahead which it seems to realize in advance. No American citizen needs but to reflect on the greatness that is now in store for his country in order to be inspired with a desire to become in all respects worthy of his citizenship. The first great conflict which all new communities are of necessity compelled to eudure against the rude forces of nature is rapidly turning in our favor. The vast increase of material wealth, the generous opportunities afforded for mental attainment and moral growth, is evidence that our past history is a fair specimen of what our future is yst to he. Our rapid increase in wealth, territory and population is without parallel. Less than 50 years ago, statesmen—even our Webster—looked upon the acquisition of the Pacific slope as a matter of no consequence. But the event has fortunately shown that no time was to be lost, as modern science was soon to bring all parts of the world into almost immediate connection. As an integral part of this nation, California, with only a partial development, has risen to an enviable position among the sisterhood of Statcs.

Our boundless mineral wealth and agricultural resources, and rapidly increasing population, guided by that spirit of progress which results from a wise legislation, guiding and fostering legitimate business enterprises, and the invention of time and lahor-saving appliances, must in the natural course of things determine what the future of our Staie shall be. If our State authorities would wisely give their attentiou to the important matter of rceeiving a portion of the vast flood of immigration which is now coming to our shores, one great element of future prosperity would be attained.

The narrow policy which at present leaves thie matter in the hands of a few agricultural colonies, is the one groat misfortune under which we suffer. In this we should emulate the example set us by eome of our sister States, whose Boards of Immigration are actively engaged in accumulating and disseminating valuable information for settlers and capital seeking remunerative investment. These institutions, owing to some unaccountahle apathy or want of foresight, have no adequate representative in our State. There is promise of cessation of that uneasy hankering after a rapid accumulation of wealth, which leads to speculation and unsettles the mind from that even, healthy condition which is so essential to a steady, normal growth. The snicidal hahit of driving husiness along at break-neck speed, regardless of consequences, so as to get all we cau out of it, must be reformed with no sparing hand. Such a rcform would redound greatly to the advantage of this community, saving it from the leveling effects of the blind business manipulations and merciless reign of the salaried officials of villainous joint-stock organizations.

Many of the difficulties which surrounded this subject arose from the indefinite ideas which the public entertained in regard to the rights and duties of stock companies, but recent legislation is tending toward a removal of these difficulties, and to a clearer and more authoritative definition of these rights and duties.

THE Acting Agent of the San Carlos reservatiou writes as follows on May 19th: There has been no outbreak of reservation Indiane on San Pedro, to my knowledge. Eskiminzine and Saguilly have heen here since Thursday. There are seven Indians only absent from San Carlos, and they are at San Pedro and Arivaca with permission to cultivate lands, and I know of none absent with passes.

A *Times* Leadville special says: A company of 100 men will he organized here to-morrow to go into the reservation. Major Kline of the formerly celebrated Buck-tail (Pa.) Regiment, will lead the expedition. It is rumored that Indians were seen in Roaring Forks to-day.

A REPORT to the annual conference of the Mormons says that the Mormon population of Utah is 111,820, that the church in that Territory has lost 600 members and gained 1,500 in a year, and that the church receipts in that period were over $100,000.

AT Havana the desire for a commercial treaty between Cuha and the United States is daily becoming more pronounced. The President of the Board of Commerce has issued a circular advising merchants to use all the means at their disposal to promote the conclusion of a treaty.

ANTIMONY is selling in Liverpool at £71 to £74 per ton for French star regulus.

The Census and the Forests.

More evidencs is received which strengthens the belief hitherto expressed that the census of 1880 will be of great value to the collection and dissemination of information concerning our industrial resources and progress. We have just received a pamphlet-circular from Prof. C. S. Sargent, of Brookline, Mass., who is the special agent of the census to conduct the inquiry into the forest resources of the country. Prof. Sargent is Arnold Professor of Arboriculture in Harvard, and well qualified for the work hs has iu hand. He bas already visited this coast, in pursuit of forest studies, and proposes to come again this summer, when we hope every facility will be afforded him to examine thoroughly our timbered rcgions and ths influences affecting tbeir growth.

The circular issucd by Prof. Sargent is a pamphlet of 94 pages, sach alternate page being hlank, so that it will serve as a note-book for field notes or for othsr annotations. It is entitled "A Catalogue of the Forsst Trees of North America." It is, of coursa, intended only as a means of drawing out information which will make it more complete and correct. We would like to ses a copy in the hands of every student of tree-growth and distribution in the State, in order that all important facts may be secured and incorporated in the revised edition of the catalogue, which will then be a work valuable for all time. We believe that Prof. Sargent desires the co-operation of all who have given attention to this branch of economic botany, and we hope he will secure it. The revieed catalogue is to be joined to hie report on the forest wealth of the United States, now in course of preparation. This report is to have special reference to the geographical distribution of forest trees, with their economic properties and uses. Knowledge of this nature in regard to our trees is still so imperfect that it is impossible to make a catalogue at all exhaustive without the assistauce of local hotanists and others interested in trees and their products in every part of tho country. The catalogue has the common as well as the botanical nameu of the trees, and is therefore intclligible to those not versed in botanical nomeuclature.

The matters on which iuformation is specially desired arc as follows:

1. The extreme geographical range of any species.
2. The rcgion and elevation where any species is principally multiplied and reaches its greatest perfection.
3. The geological formation most favorable to the multiplication and development of any species
4. Dimensions of remarkably developed specimens of any species.
5. The common or local name of any species in addition to those already given.
6. The purposes, however unimportant, for which the wood of any species is employed.
7. Products of any species other than wood, such as tannin, charcoal, dyes, potash, edible fruit, forage, etc.

If the inquiry on these points is thorough and wide observation elicited, as we hope it may be, the result will be of incalculable advantage to the Pacific coast. Our timher resources, from California's coast and Sierra ranges, and northward even to the forests of Alaska, are of. wonderful extent and value, and it would be to the advantage of the whole coast to have them developed and utilized wisely. Already there are considerable exports of saw-mill products to the islands of the Pacific ocean and to the treeless regions of South America, hut the aggregate must be very small when compared with the trade which will ultimately be carried on in these directions. It is true that for the market at present found in this State there is little occasion to increase lumber products, but whsn one views the vast forest resources on our upper coast and remembers that older timber regione are being despoiled of their material very rapidly, it will appear only a question of time when our reserves will be called for and an immense and profitable lumbering business will he done. Such an industry will foster the progrese of the coast in many waye. It will call for more extensive manufactures of iron and eteel, and will both directly and indirectly furnish home markete for a great amount of agricultural produce. As, therefore, an agency looking toward the realization of snch results we are dispoeed to favor the proposed work of the census authoritiee with reference to our forest wealth, and we hope Prof. Sargent will secure such general coöperation among those well informed upon Pacific coast growths that the forthcoming report and catalogue will he as accurate and comprehensive as the best information can make them.

NEW MEXICAN MINES.—We glean from John Fillius, who returned from the Cerrillo mines about three weeks ago, that they are fissure veins in a limestone formation, and drifting, crosscutting, etc., are comparatively easy. The lodes carry low-grade galena averaging about 31 ounces of silver per ton, and carrying from 50% to 65% of lead. Assays range from 8 to 4,120 ounces silver per ton. Carhonate of lead is said to exist there, but it does not contain profitable quantities of silver. Mr. F. is enthusiastic over the facilities for stock raising, but there does not appear to be any special inducements for miners of this section to emigrate to the mines of Cerrillo.—*Colorado Miner.*

TELEGRAPHIC and mail communicatione have been resumed with Hanford, Tulare county.,

News in Brief.

THE slave trade on the Red sea has besn revived.

THE mortality in Paris is creating great alarm.

THE forest fires in New Jersey ars still hurning fiercely.

THE cost of the Afghan war is upward of $65,000,000.

INDIANS ars committing dspredations in western Texas.

THERE ars about 30,000 Chinamen in Peru and more wanted.

THE streets of Honolulu will be shortly lighted with gas.

RUSSIA contemplates sending several men-of-war to the Pacific ocean.

MORE than 100,000 immigrants have arrived at New York since January 1st.

GENERAL MARQUEZ has inaugurated another revolution iu northern Mexico.

SIR BARTLE FRERE bas resigned the Governship of the Cape of Good Hope.

WORK has been rssumed on the Canadian Pacific railroad at Yale, B. C.

A SUB-MARINE cable is to bs laid between ths Philippine islands and Singapore.

THE South Pacific Coast railroad commenced on the 15th to run through trains to Santa Cruz.

THE San Francisco School of Design opened Monday, May 17th, for the summer tsrm.

SEVERAL whits prospsctors were recently massacred on ths Ute reservation in Colorado.

AMONGST the Jews ordsred to leave St. Petersburg, Russia, there is a citizen of the United States.

THE President has nominated N. G. Ordway, of New Hampshire, to he Governor of Dakota.

BY the bursting of an old shell at Nanaimo, B. C., a few days ago, several persons were injured.

ALL of the Chimehnevas Indians in Arizona have surrendered and are now held as prisoners of war.

THE Zurnat tribesmen have fortified Attiuor Pass, Afghanistan, and are holding it with 9,000 men to repel the British.

WHEELER, the last of tho Mendocino outlaws, who was sentenced to be hanged July 2d, committed suicide in his cell Saturday with morphine.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and scienec, by assisting Agents in their labors of canvassing, by lending their influeuce and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
J. F. OSBORNE—San Francisco.

HALL'S VEGETABLE SICILIAN HAIR RENEWER is a scientific combination of some of the most powerful restorative agents in the vegetable kingdom. It restores gray hair to its original color. It makes the scalp white and clean. It cures dandruff and humors, and falling out of the hair. It furnishes the nutritive principle by which the hair is nourished and supported. It makes the hair moist, soft and glossy, and is unsurpassed as a hair dressing. It is the most economical preparation ever offered to the public, as its effects remain a long time, making only an occasional application necessary. It is recommended and used by eminent medical men, and officially endorsed by the State Assayer of Massachusetts. The popularity of Hall's Hair Renewer has increased with the test of many years, both in this country and in foreign lands, and it is now known and used in all the civilized countries of the world.

FOR SALE BY ALL DEALERS.

SANTA CLARA, CAL., APRIL 18, 1880.

MESSRS. DEWEY & CO. *Gentlemen:*—I received the Letters Patent for my improvement in Paper Bag Machines, together with the extra copies that I ordered on the 20th ult. Also a copy each of your most valuable weeklies, containing a *full* description of my invention and notice of patent. You will please accept my thanks for the gentlemanly and business-like manner in which you have dealt with me from the beginning of my application, and feel assured that I shall take pleasure in recommending your firm to all who may wish to procure Letters Patent

Very respectfully yours, ED. O. BENNET.

P. O. BOX 246.

CHAS. C. MCMAHON, agent of the MINING AND SCIENTIFIC PRESS, of San Francisco, spent a few days in town this week. He reports a general revival of the mining interest throughout the State. He represents a live paper in the interest of mining. No miner should be without a good journal devoted to his interest.—*Oroville Register, April 30th.*

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EXTRA COPIES can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Chew JACKSON'S BEST Sweet Navy Tobacco.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official noticee of their companies in this paper, as the cheapest appropriate medium for the same.

Atlanta Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, the ninth day of April, 1880, and the day of sale to Wednesday, the fifth day of May, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, April 29th, 1880, and day of sale to Monday, May 24th, 1880. By order of the Board of Directors. A. F. McGREW, Sec'y.

Office—Room 7, No. 420 Montgomery Street, San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Friday, May 21st, 1880, and day of sale to Wednesday, June 23d, 1880. By order of the Board of Directors. A. F. McGREW, Sec'y.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

Gover Mining and Milling Company.—

Location of principal place of business, San Francisco, California. Location of works, Amador County, near Drytown, California.

Notice is hereby given that at a meeting of the Directors held on the Fifth day of May, 1880, an assessment (No. 42) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, No. 402 Front street, room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Twenty-first day of June, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Wednesday, the Fourteenth day of July, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. O. WILSON, Secretary.

Office—402 Front street, room 8, San Francisco, California.

Palmer Ice and Refrigerating Company.—

Location of principal place of business, San Francisco, California. Location of works, 224 Fremont street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of April, 1880, an assessment (No. 2) of 85 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the Company, No. 303 Montgomery street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 24th day of May, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 17th day of June, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. O. C. PALMER, Secretary.

Office—No. 303 Montgomery St., San Francisco, Cal.

ANNUAL MEETING.

OFFICE OF THE

Pioneer Consolidated Mining Company,

A meeting of the stockholders of the Pioneer Consolidated Mining Company for the election of a Board of Trustees to serve for the ensuing year and for the transaction of such other business as may come before the meeting, will be held on MONDAY, the Twenty-Fourth day of May, 1880, at 2 o'clock P. M., of that day, at the office of the Company, Room 4, 300 California street, San Francisco California. Transfer books will be closed on Friday, the Twenty-First day of May, 1880, at 3 o'clock P. M. J. M. BUFFINGTON, Secretary.

Office—Room 4, 309 California street, San Francisco California.

DIVIDEND NOTICE.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

Rotary Pulverizer,

(WHITE'S IMPROVED,)

For Disintegrating Ores and Other Substances.

GUARANTEED TO BE EQUAL IN CAPACITY TO A

HUNDRED STAMP BATTERY!

IS FITTED UP WITH

Homogeneous Steel Beater Bars.

Found to be more durable than either Hard Steel or Soft Iron. Dry-crushing the hardest rock; will last for months, and without the slightest danger of breakage.

The Pulverizer requires about one-third the power usually expended for the reduction of the same amount of Ore by Stamps.

Price List, Etc., of the White Rotary Pulverizer.

No.	Tons Per Hour.	Inches Diameter.	Revolutions Per Minute.	Horse Power Required.	Shipping Weight.	Lumber Required.	Price.
1	6	56	600	40	12	6,000 ft.	$5,000
2	10	72	470	60	15	9,000 "	8,000
3	16	84	400	75	20	12,000 "	10,000

The Repairs on the Pulverizer will not exceed those of a 10-Stamp Battery.

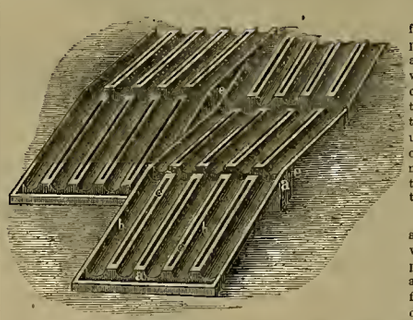
The Shipping Weight of the entire apparatus is not one-eighth of that of Stamp-Mortars required to do an equal amount of work. ☞It can be placed and put running at the Mill in from fifteen to twenty days.

Address GEO. W. WHITE, Inventor.

Manufactured exclusively at the ÆTNA IRON WORKS, 217 Fremont St.

San Francisco, Cal., January 1st, 1880.

Howland's Under-current, Mill and Sluice Riffle.



This invention meets a want which has long been felt by Gravel Miners and Millmen, viz.: that of a simple, cheap Riffle which will save the largest possible amount of gold or sulphurets, with the least possible waste of quicksilver. That this Riffle answers all these conditions will be apparent to any practical man who takes the trouble to examine it. The arrangement of this Riffle is such that there is a strong, unobstructed upper-current to carry off and break up the gravel or cement, and a slow under-current, checked by numerous riffles, which give gold or sulphurets a better opportunity of settling than if they were exposed to the force of the main current.

In this Riffle there are cast troughs for the quicksilver, which extend entirely across the sluice, and while they are so placed that the current will naturally pitch towards them, and give every opportunity for amalgamation, the quicksilver is fully protected from flouring or leakage. There is no mechanical skill required in taking out or replacing the sections.

Full particulars in regard to this invention can be obtained by applying to

STEIGER & KERR, of the Occidental Foundry, 137 First St., S. F.,

Who have the sole right of manufacturing this Riffle, and who will receive and attend to all orders.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

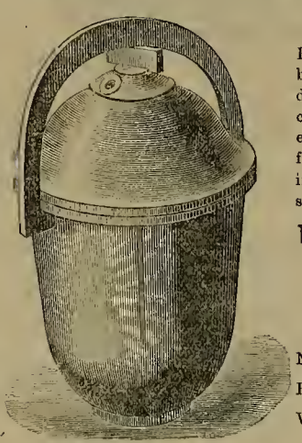
THE NEVADA OVAL TOP RETORT.



The advantage of this Retort over the OLD FLAT PATTERN is, that it can be filled full of Amalgam, thereby holding more than the old style, besides avoiding all danger of an explosion owing to the crown space in the cover which allows for the expansion. They are made extra heavy, WELL GROUND in the joints, and are furnished with a strong Norway clamp, having a wrought iron key which can be driven in or out of place by a single stroke of a hammer.

The Annoying Thumb Screw is Entirely done away with.

We Make Seven Sizes, as follows:

Number or Pints.....	1	2	3	4	5	6	10
Holds Pounds Quicksilver	12½	25	38	50	63	75	125
Weight each.....	10 lbs	15	18	25	31	44	65

TO QUARTZ MINERS.

"The Most Perfect Machine yet Introduced into Mining."

Indorsement—Pool Mine, Hornitos, Mariposa county, Cal., May 10, 1880.

ALMARIN B. PAUL, Esq.—DEAR SIR:—After a trial of your AMERIOANIZED ARASTRA we are prepared to say that it runs with less than five-horse power and its capacity all that is claimed for it, viz: Ten tons per day, receiving ore from No. 20 Screen. It runs splendid, and the more we see of it, the better we like it. It gathers much more float gold than we expected it would, and we cheerfully recommend it to the attention of quartz miners as a most thorough pulverizing, amalgamating and concentrating machine. Yours truly, P. W. JOHNSON & Co.

This Arastra can be seen and circulars had, by applying to ALMARIN B. PAUL,

Reverberatory Roasting Furnaces.

We give engravings of a single roasting furnace taken from Kuetel's "Roasting of Gold and Silver Ores." Figure 1 shows the section and Fig. 2 the ground plan. Reverberatory furnaces is the name applied to all horizontal hearth furnaces provided with grates and fireplace on one side, and a flue connected with a chimney on the other. The draft here is created by the chimney instead of by bellows, as in blast furnaces. Therefore, only such fuel is used which gives a flame, and consequently no charcoal, coke or anthracite is serviceable unless in a gas reverberatory furnace, where gas (carbonic oxide) is produced from charcoal or other fuel—sometimes also by the aid of compressed air—and burned. The reverberatory roasting furnaces are constructed in various ways. There are single furnaces with but one hearth, and double furnaces with two hearths, one above the other. Sometimes above the second hearth there is a third one for the purpose of drying the charge. Long furnaces are preferable.

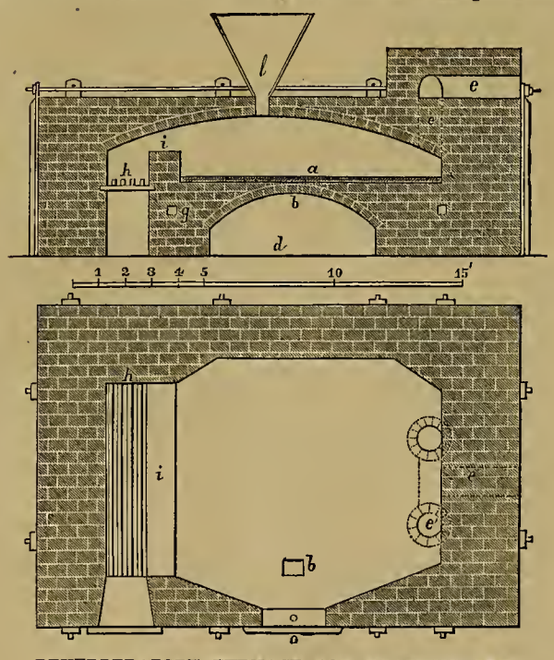
The bottom, *a*, or the hearth, is made of the hardest bricks, laid edgewise, and as close as possible. Some masons lay the bricks flat. This mode is cheaper and quicker, but inferior and less durable than the former way, and requires a more carefully prepared foundation. The very best bricks must be selected for the hearth. *b* shows the discharge hole in front of the hearth. It is more convenient to draw the ore toward the front hole than to have a door for this purpose behind, but circumstances may decide for such discharge doors. The flue, *e*, is in connection with the flue-holes, *c*, in the arch, as indicated by dotted lines in Fig. 3, and is from nine to ten inches in diameter. The flue-holes in the arch have the advantage that no ore can enter when being stirred, as often happens when the flue commences at the hearth. The distance between arch and hearth near the bridge is twenty to twenty-one inches, and near the flue only eight inches. The flue leads into the chimney in any suitable direction, either directly or through a dust chamber. Often the flue is led under the floor (when the chimney is at some distance from the furnaces), and is made wide enough to serve as a dust chamber—say two feet wide and three feet high, or wider if several furnaces are connected therewith. The chimney is from twenty to fifty feet high, and from one and one-half to three or four feet square in the clear. On the top of the chimney an iron cover, controlled by a chain, regulates the draft. This is practicable only when but one furnace is attached to the chimney, otherwise dampers must be provided for each furnace in the flue. The bridge, *i*, is much exposed to injury by fire on one side and by raking on the other. It is, therefore, advantageous if the upper part, or the whole bridge, can be made in two or three parts, and of some fire-proof stone—sandstone, granite or some conglomerate which does not burst when heated. The grates, *h*, are twelve to sixteen inches below the top of the bridge, eighteen inches wide, and from six to seven feet long. The space between the grate-bars is one-fourth to one-half of an inch.

In the roof near to the bridge is an opening four to five inches square, of cast iron, in connection with a funnel, *l*, of sheet iron. This funnel must be large enough to receive one charge of the ore. A slide keeps the ore in the funnel. The roof must be either eight inches thick or the double length of the brick; that is, sixteen inches. Under the hearth there is an arched space, *d*, into which the roasted ore is drawn through the discharge hole, *b*, either directly into an iron car or on an inclined floor, on which the ore slides from underneath the furnace. In front this space is shut up by brick work. For the purpose of easy drying it is well to have open some holes, *g*, for the escape of dampness. It is not necessary to build the block under the hearth solidly of bricks. The space inside is generally filled up with rubbish of bricks and stone, or it is still better to build the floor on arches.

St. Louis is organizing a mining stock exchange.

Our Product of Gold and Silver.

The United States Treasury Department is now engaged, through its Mint Bureau, in collecting statistics from the gold and silver mines in all parts of the country, for the purpose of ascertaining with something like precision our production of the precious metals. Hitherto this important business has been done in an immethodical and perfunctory way, and the figures were only roughly approximate; but now that the task is undertaken by the general Government, we have reason to expect systematic and highly satisfactory results. We learn that the responsible duty of collecting the statistics relating to California, Nevada, Oregon, Idaho, Montana, Colorado, Dakota, Utah, Wyoming and Arizona has been assigned to Mr. A. M. Lawyer, of the United States Branch Mint in San Francisco. Superintendents of mines, or the managers of mining corporations, need have no hesitation in giving full and trustworthy returns, as assurance is given that the details of their statements will not be published, but only



REVERBERATORY FURNACE FOR ROASTING ORE.

the total product of each State and Territory. The official report of these statistics is to be completed next September. In order to obtain the information desired, circulars have been sent to postmasters, registers of United States Land Offices, superintendents of mines and mining experts in each county in every State and Territory, requesting them to forward to Mr. Lawyer the name of every private and incorporated mine which had come to their knowledge, with the address of the manager. By these means the list of private and incorporated mines already obtained embraces over 2,000 names of the superintendents of mines, to whom circulars were subsequently sent, requesting them to give the product of gold and silver for the preceding six months. We are informed that fully 600 have forwarded replies. Now that a good method has been adopted for procuring trustworthy data respecting one of the great industries of the United States—indeed, one of the greatest of the world—it is to be hoped that it will be continued and enlarged, so that hereafter the business man, the legislator and the political economist, shall have certain knowledge respecting our production of gold and silver.

The labor strikes in the north of France are about ended.

Japanese Railroads.

Unlike their Chinese neighbors, the Japanese seem to have a keen appreciation of the advantages of railway communication, and are rapidly extending the system in the various islands of the group. Already two lines of railroad have been completed in the island of Niphon, and a third line is in the course of construction in the island of Jesso, the most northerly of the Japanese group. This latter road will extend from the harbor of Otaru, situated on the west coast of Jesso, to extensive bituminous coal fields in the interior. The estimated length of this line is 54 miles. On Saturday last, Mr. Joseph M. Crawford, formerly of the Texas-Pacific railroad, accompanied by several of his former associates, took his departure on the steamship *Gaelic* for Yokohama, whence he will proceed to the field of the new road. We learn that the rails will be of English make, but that the rolling stock and engines have been already ordered from American manufacturers. The trains will be supplied with the Westinghouse brake, and an improved "spark-catcher." The latter precaution is of the first necessity; for were a chance spark to fall on one of the lightly-constructed and highly inflammable houses by the side of the railroad, entire villages would be swept away, and a natural but intense feeling of hostility would be aroused against the new enterprise.

Paper Boxes from Pulp.—A late invention makes paper boxes directly from paper pulp. Boston takes the lead in the manufacture of these boxes, which are seamless, and can be made to any size or shape. The process, as described, is, that after being dried, the boxes are run through a second machine at the rate of sixty per minute, receiving, under a pressure of four thousand pounds, each embossing as may be necessary. From the time the paper stock is taken from the bales until the perfect box is turned from the machine, manual labor is entirely avoided. By the use of one set of machines, it is said, 30,000 boxes can be produced per day, at less than one-third of the lowest market price of hand-made goods, and doing the work of two hundred hands, as the process is ordinarily conducted. The paper box has come into use for an infinite variety of purposes, and this success is an important contribution to invention.

Frightful Railroad Disaster.

Last Sunday afternoon there occurred the most frightful railroad disaster that has ever happened in California, by which sixteen persons were killed instantly, or have since died of their wounds, and forty odd were more or less seriously wounded. The news of the terrible calamity produced intense excitement in the city, for it was known that a large picnic party—residents of this city, and comprising men, women and children—had gone over the road which was the scene of the disaster.

The accident occurred on the local train of the South Pacific Coast railroad on the route between Santa Cruz and Felton. Attached to the train were three flat open cars, railed at the sides and ends, and filled with seats, each car containing eleven seats. Report says that these seats were not only crowded, but that passengers were standing crowded between them. They were also seated on the railings. The gauge of the road is three feet. The cars are seven feet six inches wide, and the side railing projects four inches, giving a total width of eight feet two inches. This would cause the car to project over the rail about two feet seven inches. Notwithstanding the crowded and "top-heavy" condition of the cars, all went well until the train passed through tunnel No. 7, where the road is downward and curved. It is reasonable to believe that in passing over this curve the cars swayed greatly, and some of the passengers becoming frightened, crowded to the inside and caused the cars to tip and jump the rail. The horror culminated. The unfortunate people were thrown in a heap against the rocky bank, a struggling mass of men, women and children, the cars passing over and cruelly lacerating and crushing those who were near the track.

This appears to be a probable theory of the cause of the disaster, although others are given. It is alleged that neither the engineer, conductor nor the brakemen had ever been over the road before, and did not know the peculiarities of its grades and curves; that after passing through the tunnel and taking the down grade there was a sudden increase of speed, which the brakeman did not or could not control. And it is alleged finally that the train was not supplied with the air-brake, which, in the hands of a skillful engineer, would, most likely, have kept the train under control and prevented the fatal accident. The schedule time on that part of the road is 19 miles per hour up grade, and 20 miles per hour down grade, which is said to have been pronounced a safe rate of speed by competent railroad men. Whether the speed of the train at the time of the accident was in excess of the schedule can only be determined, if at all, after a thorough investigation by the authorities. Nothing less than a full, intelligent and searching investigation will, or ought to satisfy the public, to say nothing of the bereaved families and friends of the victims. Now and henceforth the railroad is the common highway for civilized communities; and those communities will demand, and railroad companies must be prepared to give, absolute assurance of at least ordinary safety to life and limb and property.

An Iron Furnace in California.—The first iron blast furnace in California is now in course of construction at the Clipper Gap iron mountain, on the Central Pacific railroad, 182 miles east of San Francisco. At this point there is an abundance of hematite and magnetic ores, and an almost inexhaustible supply of wood fuel and limestone convenient for flux. Including all contingencies, $12 will cover the cost of pig metal worth $30 at least. This place is destined to be a great iron center. The entire prize is in the hands of men who known how to utilize it, and it is destined to be the parent of many new industries yet to follow, and who can foretell their extent. If we can produce cheap iron there will be nothing to forbid the building of iron ships on the Pacific. We are informed that a furnace is contemplated at Port Townsend, Puget Sound, Washington Territory. Near navigable waters is a vast expanse of very rich bog ore, practically inexhaustible. Iron and magnetic ores abound, as does timber for charcoal.

The Comstock Compared with other Fissures.

In a previous number of the Gold Hill *News* the yield of the twelve ore bodies found in the Comstock between the surface and the 1000 level was compared with the yield of the two ore bodies found between the 1000 and 2000 levels, showing that the latter returned to the stockholders in dividends nearly 400% more than the former, thus leading up to the conclusion that while fewer ore bodies were likely to be uncovered at great depths, they would be found to be both larger in extent and of richer matrix than these nearer the surface, and that, consequently, the prospects of the lode were such that it might be expected to yield more than a fair return for the investments necessary to continue its exploration at still greater depths than prospectings have yet been carried. The object of the present item is to compare the Comstock with other silver-bearing lodes, and by that comparison to show what may be expected of it in the future.

History shows that wherever a true fissure vein has been found it has never been worked out. Such veins have been, in fact, worked for ages without any perceptible diminution in their yield. Where ores have decreased in value, the ore bodies have increased in size, the increase of the one compensating for the loss of the other. Some have even increased their yield, the quality of the ores remaining unchanged. Others have been found to deteriorate from veins of silver to those of baser metals. The latter is, in fact, the most disastrous of all the vicissitudes attendant upon silver mining.

Some of the silver mines of Mexico have been abandoned time after time and have as often been reopened by adventurous speculators and found to yield largely. The reasons for their abandonment have been various. Some have been closed on account of lawsuits, others on account of political changes, others again because the ores became low grade or gave out entirely as was supposed, but when titles have been perfected or peace restored or new methods of working ores invented, whereby those of lower grade have been made to pay, and the mines have been reopened, they have in all cases yielded a fair remuneration for the expense of working them. In some, rich bodies of ore have been discovered where before none were supposed to exist.

The Valenciana mine on the Veta Madre of Guanajuato was reopened in 1760 on a part of the lode considered formerly to be of no value, and at the depth of a few hundred feet a bonanza was struck which yielded, up to 1810, $30,430,290. During that time a place of 7,000 inhabitants sprang up there. Then the rich ore of the mine gave out at the 1200 level. A large shaft was then sunk 2,000 feet and ore found, but of too low grade to pay for working; consequently the mine was abandoned and allowed to fill with water. In 1825 the Anglo-Mexican company drained the mine of water, but the expense of pumping consumed all the profits of mining, and it passed into the hands of the United Mexican company, and has since been made to yield largely.

The Veta Grande, at Zacatecas, from 1548 to 1832, yielded $666,000,000. This lode has about the same dip and is of the same general formation as the Comstock. Its clay selvages inclose large portions of country rock. It is, however, much narrower than the Comstock, varying from a few feet in width to 80 feet at the widest place. Near the surface the ore was exceedingly rich, but became poorer with depth, although more evenly distributed throughout the vein. For some time it was abandoned on this account, but at present is yielding well.

In the two mines above mentioned the ores are of lower grade as the depth is increased, but the equal distribution of the ore throughout the lode, together with the larger amount yielded, make them the sources of an immense production of silver bullion. It is important to note, however, that throughout all the levels of these mines the ores retain their silver-bearing quality. In the central part of Mexico this is also the rule, while further north where ou and near the surface the ores were rich in native silver, the ores grow poorer with depth owing to the predominance of lead, rendering them of baser quality. This is true of mines also in the Carpathian mountains, in the mines of Shemnitz, and in the vein of the Gross Gruhe in Felsobanya, all of which yielded immensely near the surface where they were worked by the Romans. In depth all the ores of these mines, however, changed to base metal ores, and they consequently yield but small profits although worked in the economical manner characteristic of European mining.

The veins of the Hartz mountains show the same deterioration, and it is only on account of the large quantities of low grade ores extracted that they can be worked with profit. The veins of the Hartz mountains have been followed down over 2,000 feet, and those of the Shemnitz nearly 4,000 feet.

In contrast to these mines are those of Freiberg where the ores, like these of the Comstock, increase in richness with depth. The mines of Quatorce, in Mexico, belong to the same class.

The veins in all of these mines, however, are narrow and frequently cross themselves, forming a kind of net-work of fissures. The same is true of the mines of Chanarcillo, in Chile, Quatorco in Mexico, Pasco in Peru, Freiborg in Saxony, Kougsberg in Norway, and Austin in Nevada. All of these, however, more or less resemble the Comstock in retaining the richness of their ores at great depths. In structure the Comstock more closely resembles the veins of Felsobanya and Shemnitz in Hungary, the Veta Madre of Guanajuato, the Veta Grande of Zacatecas, the Biscana de Real del Monte of Mexico, and the Potosi of Peru. They are all remarkable for their size as well as for permanence of their structure.

It is these large veins of Mexico and the Gang-zug of the Germans which have produced most of the silver in the world. These veins all resemble each other and the Comstock in their magnitude, their comparatively recent origin, and in their close connection with volcanic rocks. If we except the lode of Guanajuato, where in entering a different geological formation, a barren zone is reported on good authority, all these veins have been productive of good ores at great depths, although differently distributed in regard to the various levels. In them all the ores of the surface seem to have been concentrated into small bodies, but with greater depths the ore bodies have also increased in size. Unlike the Comstock, however, some of them have developed lower grade ores with increase of depth.

We know that for 2,500 feet the Comstock retains its silver ores, thus resembling the Mexican mines and differing from those of Hungary. Although the ores found on the surface of the Comstock were considered to be very rich, yet in but few instances did they return a greater amount per ton than those below the 1000 level. The average above that level was, as has been shown, $29.65 per ton. The highest for any large quantity was $48; the lowest $7.89 for surface rock. In the middle of the upper portion of the vein the average was $23. Below the 1000 level the average was $61.50. The averages of the Crown Point bonanza was $38 per ton, and of that of the Belcher, $46.50. The average of the Con. Virginia up to Jan. 1, 1878, was $93.70; of the California, up to the same period, $94.65. The ores of the latter mines came from a greater average depth than those of the former. The increased richness of the Comstock ores at increased depths, the character and size of the vein, and the comparisons above made, warrant the following conclusions:

First—The Comstock will continue to carry ore to whatever depth the vein reaches.

Second—That ore will retain its present characteristics.

Third—It is more than probable that extensive bodies of ore of increased richness will be found at greater depths.

Fourth—That these ore bodies are more likely to increase than decrease in size.

Fifth—That the yearly bullion product of the lode will be variable, owing to the rapid extraction and milling of ores when found, and the tedious work of prospecting at great depths.

Sixth—Greater equality in the distribution of ore bodies need not be looked for.

Seventh—That barren sections will be found in the immediate vicinity of ore bodies.

Eighth—That large ore bodies of high grade are more likely to be encountered than a general diffusion of low-grade ores throughout the vein.

Ninth—That barren zones will increase in dimensions as ore bodies increase in size.

Tenth—That for years to come, mining on the Comstock will neither be relinquished nor cease to be a remunerative industry.

Silver Mining in Maine.

Judge Hetzel a few days ago received a letter from a mining superintendent in Maine, who has worked in the mines of this coast. From his description of affairs it would seem that mining in that section is much different from here; in fact it is quite a genteel business and more agreeable than otherwise. He calls his mine the Gilt-edge Silver Stocking, and from present indications the prospects are very encouraging for finding a large body of silver ore. The assays are high and show but little base metal. "We are situated fifty-five miles north of Bangor and only one hundred feet from tide water. I have my own horses and buggy; board in a farm house; pay $3 per week for board, and have the historical spare room to sleep in. The water is deep enough to float the *Great Eastern*; I go fishing and catch perch, shad and lobsters. The climate is delightful and every air is filled with sweet memories of the past. Young ladies are numerous, well educated and lovely in disposition. Such sunsets can be seen in no other place. I am employed by gentlemen, who appreciate what is done for them, and make things pleasant for these with whom they associate. As regards titles to the claims, there can be no dispute. The land was taken up shortly after the *Mayflower* landed our Pilgrim Fathers and has come down from father to son." The writer concludes by saying that he is happy and contented, and never yearns for the return of his experiences on the Pacific coast. Flowers grow at the base of the waste dump of his mine, and the wood-yard is sheltered by weeping willows and waving pines.—*Bodie Free Press.*

Copper Near Mason Valley.—An intelligent American from Pizeu Switch informs the *Esmeralda Herald* that when the projected railroad is completed a large amount of copper ore will be shipped from the hills near Mason Valley for reduction elsewhere. As copper is very high in Eastern markets just now, quite a thriving business may be anticipated by our Pizen Switch neighbors in addition to the lively boom in spuds and fodder which will be sure to follow.

Deep Mining Shafts in Europe.

Twenty years ago the deepest mining shafts in the world reached only about 2,000 feet below the surface. The very deepest, we believe, was a metalliferous mine in Hanover, which had been carried down to the depth of 2,900 feet. The deepest perpendicular shaft today is the Adalbert shaft in a silver-lead mine in Przibram, in Behemia, which, in May last, had reached the depth of 1,000 meters—3,280 feet. The attainment of that depth was made the occasion of three days' festival, and still further noticed by the striking off of a large number of commemorative silver medals, of the value of a florin each. There is no record of the beginning of work on this mine, although its written history goes back to 1527. Quite recently an elegant commemorative volume has also been written and printed, which an English paper before us says is "most interesting to those who have a taste for either the actualities or the antiquities of mining industry."

There are two other localities, however, where a greater depth has been reached than at the Adalbert shaft, but not in a perpendicular line. These are, first, the Rocksalt bore hole, near Sperenberg, not far from Berlin, which a few years ago had been bored to a depth of 4,175 feet; and, secondly, the coal mine at Vivier Lsums, in Belgium, where the miners, by shaft sinking, together with boring, have reached a total depth of 3,542 feet. Taking each singly, the deepest shafts in the world, at the present moment, group themselves according to the following order:

1. The already mentioned Adalbert shaft, 3,280 feet deep. As the top of this shaft is 1,732 feet above the sea level, the bottom is, of course, 1,548 feet below it.

2. Two shafts near Gilly, in Belginm, are sunk to the depth of 2,847 feet. At this depth both were connected by a horizontal drift, from there an exploring shaft was sunk to a further depth of 666 feet, and from there again a trial hole, 49 feet in depth, is put down, so that the total depth reached is 3,542 feet. As they did not, in the bore hole, discover the sought-for coal seam, they have returned to the shaft at the 2847 level.

3. The Eimgkerts shaft of the Lugauer coal mining company, Rhenania, Lugau, in the kingdom of Saxony, is 2,653 feet deep.

4. The Sampson shaft of the Oberhartz lead and silver mining works, near St. Andreasberg, Hanover, has a depth of 2,437 feet, and is at present the deepest shaft of Prussian mining.

5. The winding shaft of the Resebridge colliery, near Wigan, Lancashire, England, has a depth of 2,458 feet. Coal is drawn from the "hanging on" at the 2418 level; the time of the cage running this distance being 55 seconds; the winding rope has, therefore, an average speed of 44 feet per second.

6. A shaft at the coal mines of St. Luke, near St. Chaumont, in the Loire department, France, reaches 2,253 feet.

7. The shaft of the Dunkirk colliery, near Dukinfield, Lancashire, is 2,069 feet deep, but the mining is prosecuted to a further depth of 755 feet by shafts from the lower levels, making a total depth of the mine of 2,824 feet.

8. The deepest shaft of the collieries near Ronchamp, in France, is 1,881 feet. A similar depth has been reached by the argentiferous mine near Kongsberg, in Norway. The mines belonging to the Roroe copper works, in Norway, have worked to the depth of from 2,540 to 4,270 feet.

9. The Amelia shaft, in the mine works near Schemnitz, in Hungary, is 1,782 feet deep.

10. The No. 1 Camphausen shaft, near Fishbach, in the department of the Saarbruck collieries, has now reached the depth of 1,650 feet, and may possibly become the deepest shaft in Prussian coal mining.

Although the depths to which the shafts enumerated have penetrated into the interior of the earth in the art and practice of mining may appear mighty, and may be an expressive witness of the great progress made in mining pursuits; yet, on the other hand, the above results may be considered insignificantly small when we compare them with the extent of the earth's crust and the diameter of the earth.

The deepest bore hole in the world is the artesian spring at Potsdam, in Missouri, which reaches a depth of 5,500 feet.

Copper Mining.—In a recent issue the *News* called attention to the fact that copper mines were in demand in this section, and that that branch of industry promised to greatly increase in the near future. In confirmation, D. H. Jackson, superintendent of the North Bonanza and Flowery mines, has purchased the copper mine in Mason valley, formerly owned by J. Daniels. There is an abundance of very rich ore in the mine. It was formerly worked by the owner and the ore hauled to Dayton for the manufacture of bluestone. There is not a timber in the mine. In extracting the ore Mr. Daniels left great pillars of ore—10 to 15 feet in diameter—as supports. Mr. Jackson will put up a furnace at the mine and smelt the copper, running it into ingots for transportation. An abundance of charcoal can be obtained in the immediate neighborhood of the mine. There is also plenty of water in the vicinity. The only drawback likely to be experienced in copper mining is that when the mines of Lake Superior find competition arising in the west, they will throw a large amount of copper on the market to reduce the price to compel suspension here, where labor and supplies command higher rates than there.—*Gold Hill News.*

Boulder Gold and Silver Mining.

There is authority for saying, says a correspondent of the Boulder *Courier*, that the broad, gold-bearing mineral belt that begins on the northerly side of Boulder county, at Jamestown, Balarat and Ward, and thence trends southwesterly by Gold Dirt and Central City in Gilpin county, and ends at Empire, in Clear Creek county, is not only the best fissure gold mining district in the Rocky mountains, but, for its extent, the most productive known in the world.

The little patch on this belt, of which Central is the center, is the best developed, because the pioneer mining energies of the country early centered there; and centered there because the ores yielded their gold more readily to the crude process of the common stamp mill. But the mining progress in Boulder county has been steadily onward, and it remains to be seen which county has the butt end of the belt. But it becomes us not to boast, as the day is past when "good indications" count for much in mining. What is the annual product of our mines, and what their capacity for increased production?—these are the questions of interest at home, and the questions asked concerning us by those from abroad who would invest.

It is noticeable that at the very time a certain class of miners began to leave this section and run to Leadville and the greener fields of the Gunnison, at that very time the yield of our mines began to augment, and have not yet ceased to increase, month by month. While we wish a fortune to every honest miner who goes to the Gunnison, we have seen too many such stampedes not to know that hardly one in a thousand will draw the coveted prizes. The toil and expense are vastly greater, and the chance of drawing a big prize no better than by investing a few dollars in a Denver lottery.

Yes, these roving pioneers are heroes in their way, but generally enduring hardness for the benefit of those who follow. In mining, one set of men lays the foundation, and another builds thereon. It was said of an ancient people: Their strength is in their rest. This is true of prospecting for the precious metals, and has a good illustration in the example and final fortune of Mr. R. G. Williamson, of this county. It is about 15 years since he set his stake on the sunny slope of Sugar Loaf, supporting himself by a little ranching and a little gulch mining, and all the while prospecting and panning, and learning, and the result appears in the development of one of the very best mines ever discovered in Colorado. His strength has been in his rest. Had he wandered all Colorado over, there is not one chance in a thousand that he would have done as well.

There is a strange fascination about the idea of an adventure to Leadville or the Gunnison, in the hope of happening to the lot of a bonanza king; but it is believed that to-day, in proportion to the number of men engaged, there are more mining fortunes making in this county, by the discovery of rich mines, and by legitimate traffic in mines, passing them into the hands of Eastern men who have money to invest, and like mining property, and have the means to work it to the greatest profit, than are made, or will be made, on the track of the great rush to the southwest.

Pinal Mining District.

If those timid persons who fear for the future of Tucson would give a little attention to the rich deposits that lie close by, heavy deposits from which, in future years, are sure to flow rich streams of bullion, they would save themselves much trouble. There is to-day scarcely a point in the Territory that has been so utterly passed by as the Sierritas, and yet no region has a better formation, or more promising surface veins. The present season, however, promises to witness a radical change. Several claims have recently been found of such apparent excellence as to demand attention, and a constantly increasing activity is to be noted in the working of prospects.

A little southeast of the San Xavier well is a considerable camp, and a number of prospects are showing excellent and steady ore. The Esperanza which lies ten miles south of the well, is being steadily developed and looks finely. From the bottom of the main shaft, and from a drift up the hill from the 100 level, a fine galena ore which assays $100 per ton is coming up, and the erection of smelting works for the mine is only a question of time.

Several fine looking claims near the Esperanza will shortly be in the hands of good working companies.

Two and a half miles west of the Esperanza Messrs. Tarr & Randle are opening up the Providence, an unusually fine looking claim. And still nearer the mountain summit James Blade and others are superintending work that shows ore which men in some big camps would be glad to see.

On the west slope of the range, J. McC. Elliot and others have several claims which show beautiful galena, and the owners think they have the coming bonanza.

There are other properties that will be heard from daily. The motto of the Sierritas seems to be—"Slow, but sure."—*Arizona Star.*

Prof. Proctor says that he finds the interest in scientific matters much more widely spread in America than in England, more people attending lectures here and reading and thinking intelligently upon these subjects.

MECHANICAL PROGRESS.

An Interesting Experiment.

A trial of Dr. Charles Holland's hydro-carbon retort was made lately on the Long Island railroad, between Long Island City and College Point. The invention, which consists of an apparatus for the decomposition of water into oxygen and hydrogen, and the incandescence of these two gases with the aid of superheated steam, with the carbon of petroleum or naphtha, so that a combustion, which is almost perfect, is obtained, was applied to the boilers of the great locomotive "Hempstead," which is one of the largest locomotives in the United States. Very little alteration of the engine was necessary. J. W. Houchin & Son, the Brooklyn engineers, were in charge of the arrangements, but they had to do little more than place the retort in the fire box and connect it with the naphtha tank in the tender. There were 180 jets of a flame at white heat in the retort, and the flames on trial experiments made before the train was started were turned off and on almost instantaneously. When the train was put under way the advantages of the retort became instantly apparent. There was little smell from the engine and no smoke, and of course no cinders or sparks. During this trial trip an estimate of the amount of naphtha consumed was made, and it was found that the cost was 7½ cents for a run of 6 miles, which is much less than the consumption of coal would amount to. Engineer Edward Harris, who ran the train, said that he was perfectly satisfied with the working of the retort. One of the advantages claimed for the retort system is that when no power is needed, as on down grades, the fire can be cut off and the fuel saved. So far as the application of the retorts is concerned, Dr. Holland says that they can be fitted to any engine, and the experiment clearly showed that the difference in the manner of furnishing the motive power made no difference in the manner of controlling the engine.

In connection with the above it may be interesting to state that the Germans appear to be making rapid progress in applying gas firing to steam boilers. Herr G. Liegel, of Strausleud, announces that by a system developed by him he has obtained very favorable results. During an experiment lasting 72 hours, he evaporated in a boiler having a heating surface of 27.1 square feet, 9,766 pounds of water, having an average temperature of 62 degrees. In order to do this he used 1,058 pounds of coke. Taking into account that 164 pounds of ashes were left behind, it will be seen that 894 pounds of carbon were actually used, so that 10.92 pounds of water were evaporated for every pound of carbon, which, if the hydrogen in the coal, 0.56, be taken into account, would yield a useful effect of 82.3%

What Old Triangular Files can be Used For.

In many small shops, but more particularly in the shop of the jobbing gunsmith, where there is more or less saw filing done, there soon collects quite an amount of worn-out three square or triangular files. When worn, they are generally thrown aside as worthless but very little except for old steel, but their sphere of usefulness need not end here.

Probably one of the most curious uses to which such a file can be put is that it can be made into a very good glass cutter. Grind the three sides at the point smooth, so that the teeth are obliterated. Grind the sides flat, but shape the point curved or convex. To use it, hold the tool so that one of these sharp rounded edges will bear upon the glass, and with a little pressure draw it steadily over the glass. The result is a slight scratch or cut, and by using a little force the glass will break where this scratch is seen.

If the teeth of an old file be removed by grinding, and the taper shape be preserved, it will make a passable hand reamer. If the point be made obtuse or "stunt," it forms a convenient substitute for a hand countersink. If the tool is put in a hole that is to be enlarged it will be observed that there is an equal bearing at the three points, which gives a steady hold on the metal to be removed. Now turn the tool a little so that it will cut. Observe the position and shape of this cutting edge. To the initiated it will present about the same form as that of the cutting edge of the tool used by the machinist to cut iron in the lathe.

WELDING TUBES AND TIRES.—Krupp, the great steel worker of Germany, has recently patented a new method of welding tubes and tires, which is based upon what appears to be an excellent idea, as follows: He draws the tube over one pair of ordinary rolls, and then heats the whole length of the portion to be welded by a special contrivance, which is a portable fire box, into which air is so blown that the heat is directed against the weld. After the necessary heat is attained the rolls are set in motion, and the place to be welded is repeatedly drawn through them.

A LOCOMOTIVE working by means of compressed air has been designed by Colonel Beaumont, an English engineer, who claims that such an engine would be able to accomplish a journey of 10 miles without renewing the charge of air, and drawing two loaded carriages.

Cushioning the Reciprocating Parts of Steam Engines.

Mr. Charles E. Emery, a civil engineer of New York, in a recent discussion on the above subject, sums up the principal considerations relating thereto as follows:

The clearance spaces at each end of a steam cylinder include the clearance proper, as well as the passages and other spaces between the valve and the piston at the end of its stroke. These must evidently be filled at every stroke with steam at the maximum pressure admitted. This may be done in two ways, viz., by admission of steam directly from the boiler or by closing the exhaust passage before the end of the stroke, so that the back pressure vapor will be compressed and the clearance spaces filled with cushioned steam equal, as nearly as practicable, to the initial steam pressure in cylinder. In the first case the cost is the quantity of steam taken from the boiler to fill the clearance spaces, and in the second the quantity of steam required in that particular engine to do the work of compression, supposing the net power furnished to be the same in each case. Generally the second plan will have the advantage, for the reason that the steam required to furnish the additional power will be worked expansively. There can be no economy of steam by cushioning when there is no expansion, and the full theoretical economy due to cushioning is not attained unless the steam is expanded down to the back pressure where the compression begins, which is undesirable on account of the losses due to interior cylinder condensation during extreme expansion. Hence, in practice it rarely occurs that the energy absorbed in cushioning is entirely utilized during the return stroke. Again, cushioning is an indirect operation, so the economy resulting therefrom should be charged with a portion of the friction of the engine, since the total load is increased for the same net load. Cushioning also increases the average back pressure, which, under certain circumstances, may be a disadvantage. Moreover, in balancing advantages it should be borne in mind that, if there be no cushion, the steam in clearances taken directly from boiler would do some work in an expansive engine. All these and other conditions must be fully considered to ascertain accurately the economy of cushioning, and until some one takes the time to formulate them, the common-sense view must prevail that cushioning is in general productive of a small economy of steam; that at least it causes no loss within the limits available with ordinary valve gear, and therefore may be used to any practical extent to produce desired mechanical effects. In practice the question of economy becomes of secondary importance compared with the mechanical advantages, particularly for high-speed engines.

A CHANCE FOR INVENTORS.—The German Railroad Union, in offering prizes for the six years ending July 5, 1881, suggests the especial desirability of devising the following improvements: 1. The invention of a locomotive tender or car wheel of simple but safe design, by which the loosening of tires will be effectively prevented. 2. The invention of a simple apparatus, which can be depended upon under all circumstances, which will render it possible for train-men on different parts of a long train to communicate with the engine-man. 3. The invention of a cheap but reliable signal apparatus for the automatic blocking of trains which follow each other closely upon the open road, for regulating and rendering safe the traffic on crowded sections of the road. 4. The invention of apparatus which will make it possible for a train-man, with the ordinary form of brake, to apply the brakes simultaneously on two adjacent cars. This is required especially for freight cars.

SODA ASH IN STEAM BOILERS.—At a recent meeting of one of the English technical societies, Mr. Peter Spence, a well-known manufacturer, affirmed that no boiler on his works had been chipped for the past 15 years. This he explained on the ground that he had kept the *feed water* alkaline by the addition, from time to time, of a little carbonate of soda or soda-ash.

A SHIP RAILROAD TO BE TRIED.—M. Danhourg, a French engineer, is about to test the feasibility of transporting large vessels over land. An experimental railway is shortly to be constructed at Argenteuil, upon which it is proposed to take up from the river a 2,000-ton ship and transport it to another point upon the same stream.

AMERICAN STANDARD GAUGES.—An indication of the passage of American machine practice from an art into a science is the rise of several firms who make a speciality of standard gauges. They turn out collars and plugs ground to an exact thousandth of an inch—dimensions formerly so small as to be relegated to the physical laboratory for measure.

STILL COMING.—A silk manufacturer, of Macclesfield, England, has determined to establish silk works at Patterson, N. J., to be run with American-built machinery. He will bring over several hundred expert silk workers from England.

SCIENTIFIC PROGRESS.

Temperature of Soil During Winter.

Very careful experiments were made in the *Jardin des Plantes*, at Paris, during the past winter to detect the differences of temperature at moderate depths, beneath the surface of the soil, under different conditions. The severe winter and unusual snowfall there, greatly aided the experiments. It was ascertained that grass roots exerted a marked effect in the temperature.

A striking difference was observed between the results obtained in soil covered with grass and those obtained below a bare surface of the ground. In the former, before as well as after the snowfall, at all depths below that of 5 centimeters, the temperature never descended below 0° C. Registering 3.5° at the depth of 5 centimetere on Nov. 26th, it slowly sank to 0.18° on Dec. 14th. The presence of grass appeared to effectually protect the earth beneath it from freezing at the lowest temperatures attained in that climate. Quite different results, however, were yielded in the absence of grass. In this case, at a depth of 5 centimeters, the thermometer sank below zero on Nov. 27th. Two days later it registered —2.6°. On Dec. 3d, just before the snowfall, it reached its minimum of —3.17°. After being covered with snow it registered —0.8°, and later —1.4°. The snow here appears to act in a certain measure as a screen against changes in temperature, but its conductive properties are still too marked to prevent these changes from being felt sensibly at a certain depth in the earth. In the case of the agriculturist, this slow conduction, when united to the still slower conductive properties of a tolerably thick layer of dead shoots of cereal crops sown in autumn, may frequently insure immunity from freezing to the roots below the surface.

VESBIUM, AN ALLEGED NEW ELEMENT.—In the *Chemical News* we find an abstract of a paper read before the Neapolitan Academy of Sciences, by Signor A Scacchi, on the composition of certain green and yellow incrustations which appear in certain fissures in the Vesuvian lavas of the year 1631. These incrustations consist of silicates containing copper, lead, and a body which he considers to be new, and which he proposes to call "Vesbium," from the ancient name of Vesuvius. The small quantities of this substance have permitted only a preliminary examination. It appears, however, to be a metallic acid of a red color, giving colorless alkaline salts, which turn yellow on the addition of an acid. The silver salt is red or orange; the copper salt a yellowish green. Sulphureted hydrogen gives a brown precipitate, and a blue liquid which is rendered brown by zinc. Before the blow-pipe it communicates to microcosmic salt a yellow color in the outer flame, and a green in the inner. The author does not believe in the presence of molybdenium or vanadium, though the presence of the latter seems to be indicated. Further investigation will be required to determine the genuineness of this alleged discovery.

SALICYLIC ACID AS A FRUIT PRESERVATIVE.—The British *Magazine of Pharmacy*, mourning over the bruised condition to which careless packing reduces many of the "magnificent apples that are imported from America to find their places on the dessert-table in England," and which necessitates their speedy consumption to avoid rotting, makes the suggestion that the effects of any rough handling in shipping will be harmless, if the fruit is carefully wrapped in paper previously saturated with a strong solution of salicylic acid, and dried.

RECIPES FOR THE HECTOGRAPH.—The convenient gelantine copying plate that has lately come into very general use may be made, according to Paris *La Nature*, after either of the following recipes, namely: gelatine (white glue), 100 parts; water, 379; glycerine, 375, kaolin, 50. Or, gelantine, 100; dextrine, 100; glycerine, 1,000; sulphate of barium, *ad lib.* Or, gelantine, 100; glycerine, 1,200; sulphate of barium paste, washed by decantation, 500 cubic centimeters. Or, gelantine, 1; glycerine, 4; water, 2.

NEW METHOD OF REFINING IRON.—It is reported that Mr. Krupp, of Essen fame, has obtained a patent for refining pig by means of iron oxide. The action takes place in a cupola lined with basic bricks in graphite. By this method, it is claimed, the greater part of the silicon, sulphur and phosphorus are removed, without at all interfering with the carbon.

RAPID GROWTH OF FUNGI.—A Norwich botanist amazed the other day at the rapid growth of a fungus, calculated that it had developed 10,000,000 cells in one day, or 116 cells a second. Prof. Gray, however, cites an instance where a century plant formed 2,000,000,000 cells in 24 hours, or 231,481 a second.

VALENTINITE.—The mineral valentinite, Sb_2O_3, hitherto unreported from the United States, occurs on antimonial ore at the Bagdad mine, Tempiute, Nevada, in radiated tufts of white fibers four m. m. in length.

THE Society of Natural History, at San Deigo, is doing good work in the direction of original research in that section of the State. Among other matters of scientific interest brought before it at its last meeting, May 7th, Miss Rosa Smith made a communication descriptive of a species of fish—a scaly Blenny—which she had caught in the tide pool near La Hoya, and which has been found to be new to science. All of the specimens had been sent to the United States National Museum at Washington. The fish is a small one measuring two and one-eighth inches in total length, and belongs to the genus *Cremnobates*. The specimens agree in some particular with the *Cremnobates monophthalmus*, a species taken on the Pacific coast of Central America, and described by Gunther, but somewhat more closely with Steindachner's description of *C. affinis*, a species considered by him as doubtfully distinct from *C. Monophthalmus*, Prof. Jordan considering the characteristics of this fish especially distinct from any hitherto known, has given it the name of *Cremnobates corallinæ*. Miss S. would have chosen the specific name "*integripinnis*," meaning entire fin, which would have been descriptive of the main character which distinguishes the San Diegan specimen from these already described.

CROOKES' VACUUM.—In his experiments upon radiant matter, Crookes required a vacuum of a millionth of an atmosphere. It was obtained by a combination of Geissler's and Sprengel's mercurial exhausters, and measured by McLeod's gauge. Warren de la Rue estimates that the gauge will correctly record a vacuum of one fifteen-millionth of an atmosphere. Precipitated sulphur was used by Crookes in order to absorb the mercurial vapors; metallic copper, reduced from its oxide, to absorb the sulphurous vapors, and sulphuric anhydride to absorb the vapor of water. A small radiometer was employed to show the progress of the vacuum, and a Plucker tube for a similar purpose, the spectrum of the electric spark changing with the degree of rarefaction.—*Ann. de Chim. et de Phys.*

NAGYAGITE.—In his pamphlet on "The Mineral Resources of North Carolina," Dr. F. A. Genth records the occurrence of nagyagite, a telluride of lead with nine to ten per cent. of gold, at King's mountain, N. C. An examination of the tellurium mineral in some specimens of the ore from there, recently donated to the Geological Cabinet, by Arthur Macy, E. M., superintendent of the King's Mountain mining company, shows that it contains no gold, and is therefore altaite, the simple lead telluride. The ore consists of free gold, with small amounts of argentiferous galena and blende, with this altaite and iron pyrites, the vein filling being of silicious limestone.

SULPHUROUS ACID.—The *British Medical Journal* reports the publication, by Prof. Gamgee, of a new and convenient mode of using sulphurous acid, the disinfecting qualities of which are universally known. Cold alcohol, the Professor asserts, will dissolve 300 times its own volume of the gas; and a fluid possessing such powers of concentration cannot but be as efficient as it is portable and convenient. A few drops of the sulphureted alcohol in the bottom of a trunk will disinfect any clothing that may be put into it; and fungous germs, such as must in casks, etc., may be destroyed by the use of a very small quantity.

CONCERNING ANOTHER ALLEGED NEW ELEMENT.—Norwegium found in the red nickel pyrites of krageroe. Dahll has communicated some additional facts. He finds it white, not very ductile, specific gravity 9.44, melts at 350°, and dissolves in nitric acid with a blue color, which becomes green on dilution. The solutions are precipitated green by alkalies, but the precipitate is dissolved in excess with blue color. Sulphureted hydrogen gives a permanent brown precipitate. Before the blow-pipe it gives yellow glasses, which become blue on cooling, and on charcoal with soda it forms a yellowish-green coating.

SUPERNUMERARY RAINBOWS.—When a rainbow is very brilliant secondary or supplemental rainbows are often seen near the center of the arch. Observers have generally supposed that the reduplication is never visible near the ends of the arch; but Montigny, according to a recent publication of the Academy of Belgium, saw on August last two ordinary bows with four supernumerary arches, reaching near the ground. In this case these were evidently two distinct layers of rain clouds, and the supplementary bows seemed to be formed in the lower layer.

A SOLVENT FOR CARBON.—In one of the last numbers of *Nature* we are informed that Dr. Sidney Marsden has discovered a substance in which carbon is soluble, and from which part crystallizes out in the graphitic form, the rest in the adamantine form. The crystals of the latter variety are said to be octohedra (visible, however, only by the microscope), and possess sufficient hardness to scratch sapphire.

FRENCH APPRECIATION.—The appreciation of the French for the cultivation of science in other countries is shown best perhaps by the following classification of the *foreign associates and correspondents* of the Academy, namely: Great Britain, 21; Germany, 17; United States, 8; Russia, 6; Switzerland, 6; Scandinavian countries, 5; Italy, 4; Belgium and Holland, 4; Austria, 2, and Brazil, 1.

THE annual election of the Pacific Mail will take place May 26th. It is believed that Jay Gould and his railroad friends will obtain the control.

MINING STOCKHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in Mining and Scientific Press and other S. F. Journals

ASSESSMENTS—STOCKS ON THE LISTS OF THE BOARDS.

The Mining Share Market.

The transactions in the mining share market during the week compare most unfavorably with those of the previous week. The dullness has been general and unrelieved by any noteworthy incident. There was "nothing stirring but stagnation." There has not been a week during the prolonged dullness of the market, in which the daily sales were so light. The Comstocks were not in demand, and the calls for outside shares were few and far between. And yet it is noticeable that the tone of dealers is not despondent; for the least ripple brings them to the surface full of life and readiness to take the offered prize. It is idle to speculate on the causes which depress the market at present, for no man can add to his knowledge of the "way" of the stock market by taking thought. Let him be patient, and wait and hope.

The dullness of the mining share market offers a marked contrast to the renewed and general activity at the mines. The Comstock has never been in such splendid condition for the development of ore bodies and for systematic and economical work. Almost the same may be said of the principal ontside districts—notahly Eureka, Bodie and Candelaria. In nearly all the mining counties in this State, in several of which mining had heen long neglected, the activity partakes of a vcritable "hoom" and the output of the precious metals promises to be large. These facts ought to, and they douhtless will, shortly rehahilitate the share market.

IN the estimation of the miners of Butte, Montana, Yo-go and No-go are synonymous terms, to be applied to the newly discovered mines away off east, t'other side of anywhere. At least that is what the Butte *Miner* tells us ahout it.

PLACER mining operations are quite active in the vicinity of Silver Bow, Montana, and at Rocker a large numher of Chinamen are working ground.

Bullion Shipments.*

Since our last issne, we have noticed the following hullion shipments:

Northern Belle, May 17, $8,400, May 23, $10,588; Paradise Co., May 24, $1,500; Bodie Con., May 25, $8,000; Gold Hill (Quartzhurg, I. T.), May 20, $3,100; Richmond, May 26, $17,748, valne of hars; Contention, May 15, har No. 100, a total of $206,000 since March 8; Hillside, May 25, $3,100.

*Desiring to make our list of Bullion Shipments as complete as possible, we will ba thankful to receive from mining Superintendents and Secretaries notice of all bullion shipments from their respective mines.

THE WAUGAMANN DRY WASHER.—This new dry washing machine is now on exhihition at No. 2 Sumner street, off Montgomery, in the hasement. It is owned by Waugamann & Barber, who will take pleasure in exhihiting its workings to those interested in this class of machines. Several of these machines are now in Arizona, and good reports are received from them. A manufactory is to he started in this city shortly; hut at present there are a numher on hand ready for sale. It is intended for dry placer mining particularly, hut may he used for concentrating tailings, etc. The machine is intended to he run hy hand, and is of a portahle character. We shall shortly describe and illustrate this machiue, when we will give more particulars.

CITY HALL ARTESIAN WELL.—The tests made on the City Hall artesian well, to determine the quantity of water it is capable of supplying, show the following results for eight days, commencing on May 8th, together with the nnmher of hours of pumping each day: Six and a half hours pumping brought 47,760 gallons to the surface; six and a quarter hours, 45,000 gallons; eight hours, 49,200 gallons; eight and a half hours, 52,104 gallons; eight and a half hours, 64,560 gallons; nine hours, 68,160 gallons, and nine hours on the last day, 66,960 gallons

MINING SUMMARY.

The following is mostly condensed from journals publisbed in the interinr, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

GOVER.—Amador City *Dispatch*, May 22: The Gover mill is only kept running part of the time, owing to the scarcity of rock. The ore that is being crushed, bowever, is of a very fine quality.

THE Yellow Jacket, at Drytown, bad ite first clean-up last Tuesday or Wednesday, and the yield was very satisfactory to the owners.

THE Little Amador mine is still closed down, and it is not yet known when it will start up again.

TEAMSTERS have again commenced hauling timbers, lagging and wood to the Bunker Hill mine, whicb had entirely exhausted the supply ou hand.

VOLCANO ITEMS.—*Ledger*, May 22: Our town has been full of quartz men the past few days. Strikes and rumors of strikes ou every hand. James M. Hannaford, of the Downs mine, with the Hon. Mr. Downs himself, are here at the present writing, rumor says, looking out the site of a mill. Two air compressors have been received by the Volcano gold gravel mining company, and are being put in place. The Stewart & Gillick has been sold to Mr. Lyle, formerly of tha firm of Jennings & Brewster, of San Francieco. We are not posted on the price, but tha sale comprises mill and mine.

PLYMOUTH NOTES.—Amador City *Sentinel*, May 20: Ground has been broken for the shaft of the Pacific company, east of the Empire. Extensive works will be erected upon this claim. Wa understand that Mr. Hayward is the owner of the greater portion of the stock of tbo Pacific.

BUTTE

NEW MINING BOAT.—*Mercury*, May 21: C. R. Clark, of San Francisco, bas been in Oroville for a week or so back looking for a location for a mining boat. He represents the Roy Stone hydraulic mining and dredging company, of Hartford, Connecticut. James C. Gray made a proposition to the gentleman which he regarded in a favorable light, and we apprehend that the new enterprise will shortly ba set in operation. This boat is claimed to ba entirely different from any yet introduced on this coast.

CALAVERAS.

MINING ITEMS.—Calaveras *Chroniele*, May 22: We learn that the mill on tha Livermore mina, Whisky Slide district, is being repaired, and that active oncrations are soon to be renawed in tbe mine itself. There is a genuine quartz boom in progress in this county, suro. Work is being resumed in mines that have laid idla for indefinite periode, and new developments are constantly being made. Dave Lampson le running a tunnal undar the old Pacific Slide, or near it, in Rich gulch. He says that prospects are encouraging. Tha ground is getting a little softer, and the gravel begins to show gold.

GWIN MINE.—We are pleased to be able to record very encouraging intelligence from the Gwin mine—news of no less importance than that pay ore has been etruck in the 600 leval, south. Our information is that the ledge is wide and the rock rich. A large amount of a fair quality of ore has been taken from the 500 level, eouth, and nnw tha striking of the cbute in the 600 level is very strong evidenca of a great ore body south of the old workings.

EL DORADO.

GRIFFITH CON.—*Republican*, May 20: Rock is now being taken from tha Griffith Con., near Diamond Springs. There ie a large body of ore in sight. A drift is now being run at a deptb of 40 ft, and as soon as tbe volume of water is lessened, sinking will be continued.

GREENWOOD MINES.—Mr. Leavitt tells us that his company will commence on tha Pilot Hill mines during this week, and that they intend giving them a good trial. Also that they intend putting up sulpburet works here forthwith, to enable the miners to test the value of their sulphurets in both quartz and seam diggings in this neighborhood.

THE Kelsey gold and silver mine is shut down for nonpayment. No blame can bo attacbed to Superintendent Hodga. The capitalists below have an idea that tbe poor miners require no pay for their work.

Now that tha weather bas become settled and tha roads good, there is a freshly-awakened interest in our mining industries that bids fair to make things exceedingly lively in a month or two.

INYO.

MINING ITEMS.—*Independent*, May 15: The developments of the winter in tha old Black Warrior gold mine, in the mountains to the west of Big Pine, have been of unusual importance. The district will boom ahead during the summer, as the plentitude of water will allow more extensiva workings of the rich placer claims. Mr. Wm. Crapo has had a good force at work on tbe Crapo property —the old Buena Vieta ledge at Cerro Gordo—drifting into its immensa croppings preparatory to sinking. The outcrop is visible as far as Buena Vista mountain can be seen, and consists of an ore body 300 ft in length and from 30 to 50 ft wide, sampling $102 per ton in silver and gold. It would require years for a 20-stamp mill to make a respectable hole in this bonanza.

IN FULL BLAST.—Inyo *Independent*, May 22: It is pleasant once more to note that two of the Darwin furnaces are once more in full blast, and both running beautifully. These are tha Defiance, under Supt. John Gorman and foreman Martin Mee, and the New Coso, we presume under Supt. J. J. Williams. The Custer has produced about 10 tons of bullion every 24 hours. The New Coso commenced running on the same date, and is making a splendid run. The town is quite lively, and will continue so for tho balance of the month.

MONO.

NORTH FORK DISTRICT.—Mammoth City *Herald*, May 15: Tom Agnew, who has just returned from this district, informs us that the mines in that locality on which work has been prosecuted during the past wintar ara all looking remarkably well. Most of the work which has been done is tunneling. In several of these tunnels ledges of good mineral-bearing quartz have been encountered, but in no case have the main ore bodies been struck. It is confidently expected that a great amount of work will be done this season. Two men have gone out to the settlement in the western valley in order to bring in a supply train as soon as possible. The isolated inhabitants have all enjoyed good health, and having laid in a sufficiency of the necessaries of lifa before the snow fell, have not suffered. Mr. Agnew, John Kehoe and others will soon go over and commence operations on their mines.

BODIE MINE.—*News*, May 23: No mine in Bodie district attracts as much attention from the mining public as the Bodie. Ore bodies of nearly pura gold have been opened and extracted. The stock has fluctuated from $30 to $2, $4, $6 and $7, caused by working out ore bodies in sight, and having no reserves—and not, as many suppose, from the mine being worked out. To-day, tha Bodie stands second only to the Standard. Tha works of the Bodie are well arranged for working the mine in a most effectual and economical manuer. The blacksmith ebop is large and roomy, and fitted up with every convenience for good work. The hoisting engine is a 50-horse locomotive, that does tha work of hoisting with ease. The air compressor engina is a 60-borse power—steam cylinder, 14 inches in diametar, 32 stroke. The compressor is 12-inch, Scott, Prescott & Co. makers. It furnishes air to run the pump and hoisting engine on the lower levels.

NOONDAY.—The incline from the 512 level is now down 10 ft. Tha watar bas retarded progress of the work somewhat. In the nortb drift, vein No. 2, same level, has been advanced 19 ft, and south drift, same vein and level, 10 ft during tbe past week. The excavation for machinery on the 512 level is being made with all possibla dispatch. The station preparatory to crossouting from the 512 level is about completed. On the 412 level the north drift on vein No. 1 was advanced during the week 13 ft; the south

drift 4 ft. Are now crosscutting the vein at that end of the south drift. The vein is somewbat broken. The crosscut is in 15 ft and the footwall not yet reached. Work on vein No. 1, 412 level, has been suspended, and the force transferred to the incline, 510 level. Stopes No. 2, north drift, 312 level, are looking well. The east crosscut from south end of main south drift, 312 level, has been advanced 12 ft. This will shortly cut a vein cut 100 and 300 ft north, finding good ore in both places. The No. 2 vein, 362 level, is now connected with the 212 level by an upraise. The south stopes of the 212 level are looking well.

ADDENDA.—Work in this mine is making the usual good progress. The shaft is now down to the 500 level and a station set is being put in place at this point. The shaft will be continued 20 ft further in depth, and used for a sump. This will be completed by next Saturday, when a crosscut from the 500 level will be started to cut the Addenda ledge. From the pitch of the ledge in the winze of the old works, 460 level, this crosscut cannot have more than 20 ft to run to intersect it, when the work of drifting on the ledge, upraising to the winze of the old works and preparing for the extraction of ore will be pressed forward with all the vigor for which the management is noted. The prospects of the Addenda are brilliant, and when fully prepared to work their ores, another dividend-paying mine will be added to the Bodie list.

UNIVERSITY.—The shaft is now down 32 ft below the 510 level in a vein porphyry formation, strongly impregnated with sulphurets of iron and carrying bunches and seams of good ore. The west crosscut is now in a distance of 65 ft from the shaft, the formation being of a most favorable mineral-bearing character. There is a slight seepage of water, indicative of the near approach to the ledge. The west crosscut is now in 50 ft. The rock is hard, but works well, and seams of clay and quartz are continually coming in. The formation is of iron-stained porphyry. The skip has been altered to a cage and another deck is soon to be added, making it a double deck cage, which will facilitate both the extraction of ore and debris. The machinery is all in good order and perfect system prevails.

MONO.—Work at the Mono is making good progress, and notwithstanding the heavy flow of water the pumps handle it with ease. The north drift from the east crosscut, 600 level, is now in 25 ft. This drift will be run to the boundary line between the Mono and Bodie, where a joint crosscut will be driven to the east line of their ground to thoroughly prospect it at this point. At the surface everything is in perfect working order. The Box furnace is giving perfect satisfaction, saving from 8 to 10 cords of wood per day. Formerly from 20 to 24 cords of wood per day were used, while at the present time from 12 to 14 cords are consumed.

TIOGA.—During the week we have added 14 ft to the length of north lateral drift No. 1, 800 level, making its total length 24 ft. The upraise on the vein from this drift is now 12 ft in height, with the vein in the top looking well. West crosscut, same level, was advanced 13 ft. Assays had from the quartz and porphyry passed through during the week range from $15 to $125 per ton; the average being about 4-5 gold and 4-5 silver. Have timbered 47 ft of the Syndicate tunnel during the week, and expect to finish the drain and the timbering of this drift within the coming week.

BOOKER.—Under the efficient management of Col. Ellsworth, the work of development in this mine is making fine progress. The east crosscut, 500 level, is now in 75 ft. The rock works well. There is now a steady flow of water, but it has decreased very materially since pumping recommenced. The pumps handle it easily, working six strokes per minute. At the surface everything is in perfect working order. There is scarcely a jar perceptible in working the pumping engine.

BODIE BLUFF.—The north drift, 200 level, has been advanced 18 ft the past week. The ledge is continually improving as advance is made, and is now compact and solid and increases daily in width. The ore is bright and lively, giving good assays. The south drift, same level, is now in 18 ft. The ledge looks about the same as in the north drift. The ground in both drifts works well. At the surface everything is in good order, indicating fine management.

SOUTH BODIE.—Work in the east crosscut, 500 level, is making fair progress, considering the character of the ground. The rock is very hard and breaks short, otherwise the mineral-bearing indications remain unchanged. There is a slight seepage of water in the face of this crosscut. They are working 3 8-hour shifts and pressing developments as rapidly as possible. At the surface the machinery is in good order and works well.

GOODSHAW.—Work on the Goodshaw is being pressed with all possible vigor. The east crosscut, 600 level, has been advanced during the week 20 ft; total length, 122 ft. The formation is of the most favorable mineral-bearing character. The west crosscut, same level, has been advanced 7 ft. The rock is hard, and are working but one man—single-hand drill—on a shift. Total length, 40 ft. At the surface everything is in perfect working order.

BONIE TUNNEL.—Advance made in the main tunnel for the past week, 13 ft. The formation continues of the same favorable mineral-bearing character as in the last 100 ft. The south drift on No. 7 ledge has been advanced 11 ft—single-hand day shift—for the week. They are simply stripping the ledge and taking out only such ore as falls in the work, which continues to average good milling ore. The air pipe is all laid, giving a fine ventilation to all parts of the mine.

SOUTH STANDARD.—The work of repairing the engine and boilers was completed on Thursday and sinking resumed, since which time fair progress has been made. The surface water continues to retard operations in the shaft to some extent. It is, however, decreasing daily, and in a short time will be entirely drained. The formation in the bottom of the shaft is very favorable, being quartz, clay and porphyry. The machinery is now working well and gives good satisfaction.

ORIGINAL SUMMIT.—The east crosscut on the 200 level is now in 43 ft. The rock is very hard, and progress necessarily slow. This crosscut will be continued until the east ledge is cut, which it is expected will be at about 20 ft, when that ledge will be developed and sinking for a lower level commenced.

NEVADA.

GRAVEL MINES.—Nevada City *Transcript*, May 23: Numerous gravel mining companies at Sierra City are making arrangements to incorporate, and several have done so already within a few months. It is figured out by old prospectors that at least 3 very rich blue lead channels course through the high ridges above that mining camp.

NEVADA CITY MINE.—As developments progress in the north drift of the 2d level of the Nevada City mine, the character of the ledge improves. The chute that yielded 300 tons of $30-rock in the first level is found to be of equally good appearance below.

THE hydraulic miners on the Ridge are happy at the prospect of plenty of water the coming season. The mines are now running full blast.

MINING ITEM.—Steam was raised in the boilers of the Fortuna mining company yesterday afternoon for the first time, and the work of pumping out the incline was begun. As soon as the workings are dry, the extraction of ore from the 1st level and sinking for a 2d level will be commenced.

PLACER.

MILLS AT EMIGRANT GAP.—Cor. Placer *Herald*, May 22: The quartz mills around here will run this season—the Diamond Creek, Yuba and Lindsey. Mr. Jones ran a tunnel and struck a 3-ft ledge in the bottom, carrying considerable sulphurets and showing the gold plainly.

CONSIDERABLE excitement prevails respecting quartz ledges hereabouts, several of which have been located recently; one on the trail leading to Iowa Hill, by Capt. Anderson; another, by the same party, at Secretown; another, which crosses Squire's canyon (which has paid, and is still paying, very rich), by Carr, McIntosh and Kopp.

IOWA HILL NEWS.—The Orion has been running steadily for the past 10 days. Superintendent Anderson reports the boxes looking better than he has seen them look, after the same number of days run, since the mine has been operated. The Morning Star has had new Giants put in place. A large amount of gravel has been washed at the Mitchler mine during the past two weeks, and the sluices look as well as usual. Jo. Pritchard cleaned up after a short run at his mine, and says he is well pleased with the results, and the gravel improves as he works north. The shaft at the Aurora caved several times during the past 10 days, causing much delay and annoyance. The shaft had to be abandoned for the present, and the District is being washed through an open cut. The Woodbine is being opened in good shape with both bedrock tunnel and open cuts. A large amount of gravel has been washed. The boxes look well and considerable coarse gold is to be seen in bedrock cuts. The Olencoe, a drift mine, north of the Wolverine, has been refitted, and is now being worked by Messrs. Jolly & Southwick. Pay gravel has been struck in this mine, and as soon as the dump is built, washing will commence. Considerable gravel is being washed from the Barber mine, and should the water season be a late one, the county road will have to be moved out of the way. The Homeward Bound is running in good shape and washing gravel fast. The Watt Brothers' mine, on Mount Pleasant flat, fronting on Indian canyon, and running back to the Succor Flat mine, on the main ridge, has been drifted in front and which paid rich in early days, is being reopened with a bedrock tunnel. Good prospects have been found and all the indications, both in the character of the gold and gravel, leads to the belief that this and the Succor Flat channel are one and the same. The Trio mine, at Bird's flat, has been fitted up for hydraulicing, and is now running in good shape. At Wisconsin and Prospect hills the hydraulic mines are all running in full blast. The Harmon property, with Zurmuehler's ditch, is bonded by Eastern parties.

PLUMAS.

BELL MINE.—*National*, May 15: The first clean-up of the Bell mill, since the "new departure," was made this week, and resulted satisfactorily. The mill ran three days on rock that was not considered good, as it was thought best to put through some of the poorer rock first, and get everything into good order before crushing the first-class ore. During the three days about 45 tons of rock was crushed, resulting in a clean-up of between 90 and 100 ounces of amalgam, or between $500 and $600. Mr ff. N. Brown, the new amalgamator, has adopted a process entirely different from any heretofore used in the mill, and the result indicates that much gold has been lost in the working heretofore. Mr. Bell is pleased with the prospects of the mine, as he is satisfied that they have plenty of rock which will pay better than that crushed in this run.

BIG MINING ENTERPRISE.—Plumas *National*, May 22: Mr. H. C. Newberry is now in the lower country making the preliminary arrangements for a mining enterprise, which bids fair to be one of the most successful hydraulic operations in the mountains. He contemplates bringing the water of Taylor creek to the Deadwood Channel country, at an altitude which will give all necessary pressure. The surveys recently made by Surveyor Keddie, have demonstrated the practicability of the project, and there is every reason to think that it will be carried forward. The vast extent of rich gravel which would be attainable if the water was brought on, makes the result a certainty, and Mr. Newberry has surely "got on the right string," if he can bring to bear the capital necessary to the work.

BELL MINE.—The clean-up spoken of last week, resulted fully as satisfactorily as was anticipated, between $500 and $600 being taken from 45 tons of rock. The mill was started up again on Sunday, and the indications are that the results from this run will be a decided improvement on the last.

STRUCK IT.—Two young men, named King and Neseman, have discovered a valuable gravel claim in a gulch which puts into Mohawk valley on the south side, near Mrs. King's ranch. They made from $5 to $10 per day to the man as long as they had water, and are now bringing in a ditch to work the claim.

SIERRA.

SCALES' DIGGINGS.—Cor. *Mountain Messenger*, May 22: The depth of the snow has not at any time exceeded 11 ft, and now we have not over 5 ft. Snow at the Mt. Pleasant ranch about 6 ft, while on the summit, 2½ miles from here, it averages from 25 to 30 ft in depth where it has drifted. Fairplay mines are in full blast, employing about 16 hands. The Cleveland company is employing 20 hands, and the Union Hill company about 18 hands. These companies have very rocky ground, and have to use derricks run by water power to remove the rocks. It is wonderful to see the enormous amount of rocks removed in a day by a few of these derricks. The length of the water season this year will hardly come up to the average.

MINING ITEMS.—*Mountain Messenger*, May 22: Dr. Biber has employed f. G. Jones to survey the Forest Queen quartz claim, located just south of town, and has a party in the field doing the work. The American Hill mining company is in full blast, piping off large quantities of dirt with plenty of water; working 2 monitors. They expect to do well this season. Dr. Biber is busy with his men preparing to prospect the Forest Queen quartz ledges, just south of town. He has 2 large ledges in sight, the rock of which he assures us prospects well. A piece of gold weighing $75 was taken from De Long's diggings in Hog canyon, a few days since. We understand that the Savage company has let a contract to run their bedrock tunnel to a gentleman from Virginia City. It is rumored that the contract price is $20 per ft.

LEDGES.—Nevada City *Transcript*, May 22: Rich quartz ledges have recently been discovered near Allegbany, and the country along the creeks le located for miles. The Savage gravel mining company, composed of leading Virginia City capitalists, whose mine is located on the ridge near Sierra City, has let a contract for 200 ft of tunnel at $20 per ft to John Herby. Considering the formation is the hardest quartzite rock, the price is reasonable enough. The North fork gravel mine, at Forest City, is not paying at present, but another rich strike may be looked for at an early day. The last clean-up was surprisingly large. This claim so far has been "spotted," but the owners are sanguine of eventually finding a branch of the main blue lead channel which will fully equal in richness any heretofore developed. Thousands upon thousands of dollars have been expended on this mine.

TRINITY.

FOREST FORKS.—Cor. Trinity *Journal*, May 22: Here at Forest Forks the late severe storms have delayed everybody, but now all are at work again with prospects of a very large run of water. Slide Creek gold mining company some three weeks since had a great slide, carrying away over 125 ft of their flume, which took some 10 or 12 days to repair the damages done. They are at work again. Their last clean-up was better than any previous, having cleaned 18 ounces in 6 days' run—a very fair showing, as they have only four men in the claim. Their bank is now about 40 ft high, of which 15 to 18 ft is wash gravel. It just requires their rigging to work such a bank, and as their dump is very high they are probably doing more work than any four men in the county. Messrs. Brooks & Sherwood are building a house and getting ready for a good season's work. They have two ledges. Specimens were found some years ago that weighed 18 ounces; and one found two years ago by Mr. Brown weighed 13 ounces. Some very nice specimens have recently been found, two by Mr. Brown last week weighing respectively $10 and $8; and one the same week by Mr. Guillaume of $16—all on Pony creek. Mr. Brown is very lucky with finding large specimens. He has dug out five pieces this winter worth $46. Another large piece was taken out last summer. I do not know the exact value, not having seen it, but it is said that it was over $200. The great *desideratum* of this place is a few men with sufficient capital to rig claims with pipes and giants. Such claims would pay well where the method now employed—ground sluicing—fails to pay, the result being that those claims only are worked where the boulders are not too heavy to handle. It is a positive fact that there is more gold on New river than any other of the numerous streams of these regions. In the same volume of gravel the difference being that in ground sluicing in most places more gravel is washed out in a given time than is done here. And if it pays now how will it be when claims are rigged so that most of the boulders are sent through the flumes? The result obtained by Slide creek shows.

TUOLUMNE.

OLSEN MINE.—Tuolumne *Independent*, May 22: The mine is in active operation, 21 men being engaged erecting the hoisting works and putting the engine in place, making roads, etc., while several carpenters are at work erecting a fine 2-story building, to be used when finished for a lodging house, thus making Golden City quite a lively place again. A 10-stamp mill has been constructed in San Francisco, with a capacity for crushing 30 tons a day, which will be forwarded now shortly, and erected for convenience of water power on the Tuolumne river, about 5 miles distant. The ore will be carried there at first in wagons, which in time will undoubtedly be superseded by a tramway, connecting the mine with the mill. The ore body is from 10 to 18 ft in width, and has been prospected 230 ft; how far beyond it extends is not known, but will soon be prospected. The decomposed mass coming from the bottom of the shaft, upon being prospected in a pan, showed free gold in large quantities.

THE Perera claim, at Jamestown, is a recent discovery and is not yet developed. The ledge is in the nature of seams, ranging from f to 4 inches in width, some of which is very rich.

NEVADA.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, May 26: The north drift on the 2500 level, running from the main east drift on that level, 350 ft east of the incline, is in 90 ft, and continues in heavy vein material of a very promising character. The drift sent in from the face of the main crosscut east penetrated a total distance of 240 ft and found some water.

UNION CON.—In the drift to connect No. 1 winze on the 2500 level with the station of the Sierra Nevada incline, some narrow streaks of fair grade ore have been encountered, but not of sufficient strength to pay to assort out, nor rich enough to raise the quartz passed through to milling ore.

BELCHER.—In pushing the south drift on the 3000 level ahead some quartz of a bright, lively and promising character has been encountered. Work in this direction is being urged forward with all the energy possible.

CALIFORNIA.—The winze from the 2000 level has connected with the raise from the 2100 level, and now the ore known to be in this part of the mine can be reached and extracted.

SIERRA NEVADA.—The drill having been sent ahead in the west crosscut, 2300 level, a total of 58 ft and finding no water to binder, the crosscut is being pushed ahead; total length, 70 ft.

YELLOW JACKET.—The station at the 2328 level, corresponding with the 2700 level of Crown Point and the 2760 level of the Belcher, has been completed and the drift started to connect with those levels.

MEXICAN.—The north drift on the 2500 level has attained a total length from the Ophir line of 160 ft, and is still in vein material.

SILVER HILL.—The crosscut east, 1300 level, from the drift south, is now in hard rock, carrying stringers of quartz. It has passed through some streaks of good quartz giving fine assays. There is another formation ahead still more promising.

BULLION.—The east drift from the station on the 2450 level of the double incline winze had last evening been extended 30 ft. To meet this drift, one had been started from the Ward shaft, 2300 level, and run 15 ft. These workings will be connected as soon as possible, and all work thereafter be done through that shaft.

UNION SHAFT.—The placing of the sinking pump in the shaft will necessitate the carrying of the sump to a greater distance below the 2500 level than was originally intended, since that pump is itself 35 ft long and must be worked entirely below the station.

NORTH BONANZA.—The north drift, 600 level, is averaging 5 ft per day, and is in a most promising formation.

OVERMAN.—Crosscut No. 4 is making rapid progress east on the 1900 level; total length, 112 ft; the face in good vein material.

CON. VIRGINIA.—East crosscut, 2300' level, joint with California, has attained a length of 150 ft, and continues in heavy vein material. The drift south on this level is now 60 ft in length and in vein matter.

ALTA.—The west crosscut on the 1950 level is now 300 ft from the lateral drift and still in vein material. The diamond drill and crosscut opposite were sent in 432 ft.

NEW YORK.—The drift south along the new ore body is being pushed steadily, and the formation still continues to look and promise well.

SUTRO TUNNEL.—North lateral branch is now 260 ft into California ground; total length, 3073 ft. South lateral branch 396 ft into Bullion ground and in decomposed quartz.

ANDES.—Working between the 2d and 3d levels, 300 ft below the surface, and getting good indications of ore.

EUREKA DISTRICT.

WALES CON.—Eureka *Sentinel*, May 21: Our reporter has just visited the Wales Con. and found their new hoisting works very complete. The building has a frontage of 54 ft, in which are situated the blacksmith shop, carpenter shop, and also a circular saw, for the purpose of cutting wood for the engine. The engine is rated for a capacity to sink 1,000 ft. The shaft is a double compartment one, 150 ft deep, and is well timbered and cribbed. A large amount of work has been done in the way of running drifts, crosscuts and winzes. Two shifts of men are now employed. The principal work being done now is the sinking of the compartment shaft, which is to be sunk 150 ft deeper than at present, so as to connect with the 300-ft winze.

MINING ITEMS.—The owners of the Phil Sheridan mine, on Ruby hill, are about to let a contract for sinking a shaft and prospecting the mine. All the vacant ground on McCoy hill, on the west side of New York canyon, has been located during the past month, and a number of locations have been made along the footbills on the western side of Prospect mountain. George K. McCullough has opened up a fine body of rich milling ore in the Reeves & Berry, at Spring valley. Richard Charnock has several tons of very fine ore on the dump of the North Star mine.

ARIZONA.

BABOQUIVARI DISTRICT.—Tucson *Record*, May 22: Six tons of ore from the Alta mine, Baboquivari district, worked at the Arivaca mill, gave a yield of about $200 per ton. The mine is bonded for a sum reported as $30,000 to San Francisco parties. Col. Woods is preparing to take ore out of the Oriental, having sent sacks out for the purpose of containing the ore. The mine has a shaft 28 ft, and the dump carries about 25 tons of high grade ore. Everything is looking lively and business-like in the district. Several of the best mines are being worked by three shifts, and developments are of the most favorable character. This is probably the highest grade district in the county, and the ore veins are large as well.

FINAL DISTRICT.—*Drift*, May 15: The Belcher mine is the property of Wheeler, Doran and Graham. It is in view from Final, about two miles distant. There is a tunnel in 100 ft, a shaft 50 ft connecting with the tunnel; another prospect shaft on the ledge is 60 ft deep. The pay ore is near 4 ft in width at the bottom of shaft No. 2. Over 100 tons of ore on the dump assays from $50 to $1,000.

SILVER BELT DISTRICT.—*Arizona Star:* From the Silver Belt district, we saw some splendid specimens of gray copper ores brought in by Messrs. Rea and Swan. This camp is situated about 40 miles southwest of this place, and 16 miles from the nearest point to the railroad, in what is known as the Young American copper mountains. The locations are held principally by Messrs. Shaw, Fish & Co., who have bounded three of their group: the Arizona, Old Boot and Blue Coat, to Samuel Hughes, for $12,000. They have at least 300 tons of ore on the dumps of these mines. The deepest shaft is not down over 10 ft, which assays, on an average, 50% copper, and $50 to $60 in silver. The ledges seem to vary from 4 to 10 ft in width. These enormous veins or deposits run parallel, and several are embraced in one claim. Messrs. Rea and Swan own the Scout mine, near the Boot. A tunnel has been run into the lead, opening a solid mass of the same kind of ore the entire length of the tunnel without yet reaching the hanging wall. Tons of high grade cropping can be picked up on the surface for several hundred ft along the ledge, indicating that immense bodies of ore must lie beneath. Messrs. Pby, Sault & Co. have also some promising ledges of the same class of metal, and are working them with promising results. Their claims all lie within a radius of a mile, and promise to be one of the biggest things of the kind in southern Arizona, and from its close proximity to railroad communication, greatly increases their value, and we congratulate the owners on their good fortune. All facility for mining in this locality is reasonably convenient.

Miners' Strikes.

The telegraph informs us that on Wednesday last some 2,700 miners struck at Leadville, demanding an advance of from $3 to $4 per day. They held a meeting and visited the mines, compelling ths other miners to quit work. Several mines have refused to accede to their demands. The arms of the several Leadville military orgauizations are in the hands of the strikers.

There had been little or nothing rumored as to the movement until it developed itself. The wages paid are from $3 to $3.50 per day. At seven o'clock 400 men appeard at the Chrysolite mine and ordered' out the men. After some consultation, the demand was complisd with, and the men joined the strikers, who proceeded to the Iron, Carbonate and Breece Hills mines.

On Wednesday night there was not a man at any of the mines. It is estimated that 5,000 men are participating in the movement, while perhaps 3,000 other miner are remaining quiet at their homes. All the prominent mines are strongly guarded. The excitsment is feverish. Michael Mooney a Mollie Maguire from Pennsylvania, is at the head of the movement Thus far there has been no violence, and it is hoped that no serious results will follow, although the managers are generally showing their resolution to not yield to the demands of the strikers.

They are having trouble at Phillipsburg, Montana, about the Trout mine, belonging to the Northwestern company. As we understand the matter from the local papers, the company failed to pay the workmen, and the employees took possession of the mine in July, 1879. One John Caplice, of the firm of Caplice & Smith, made a proposition to the miners, saying that the company owed the firm of Caplice & Smith about $3,000; that he would go East and try to raise the money to pay the employees their wages, and if the company would not furnish the necessary amount that he would not accept the position, hut would come back and co-operate with the men, work the property and pay themselvcs out of the net proceeds of the mine and mill, which was accepted and no objection offered. The firm came into possession of the mine hy suit and attachment. There is now a disagreement between the miners and Caplice. The miners have possession of the mine. The Sheriff's officers who went to arrest the men holding forcible possession of the mine were unahls to dispossess them and did not serve the papers. The mail carrier states that the prevailing impression in Phillipshurg is that the men will resist to the last any effort to compel their surrender. They are now said to hs working the mine, their numher having been reinforced sufficiently to enahle them to keep a strong guard on the surface. There are no fewer than 60 men in present possession. What course the court will pnrsue in snforcing its mandate is not positively known, hut it is thought likely that Judge Galhraith will call on Governor Potts for troops.

The strike at Omaha at ths smelting works is over, and work was resumed on Monday the 24th inst. On Sunday the strikers voted to accept the compromise proposition of an average advance of ahout five per cent., common laborers to receive $1.65 for 10 hours, their former pay having been $1.37 for nine hours. The compromise was hrought ahout hy arhitration hetween the strikers' committee and the managers and Governor Nance. The strikers, about 200 in all, have been out nearly three weeks. They are all to he taken hack, that being a condition precedent to acceptation of the compromise.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department No. 10, San Francisco:

FAIR VIOLA M. CO.—May 26th. Object: To operate in Arizona. Capital, $10,000,000. Directors—L. M. Pearlman, James L. King, James M. Vizina, A. B. Hull and Henry Ingraham.

HIGHLAND M. CO.—Object: To operate in Lincoln county, Nevada. Capital, $10,000,000. Directors—Henry Mayers, A. Rickert, A. H. Rutherford, Albert Meyer and Julius Haumeister.

PACIFIC COAST APPROPRIATIONS.—The following items for the Pacific coast are in the Sundry Civil hill reported May 22d: For the completion of the Appraisers' huilding in San Francisco, $3,500; for completing the lighthouse with fog-signal at Admiralty inlet, W. T., and for huilding steam-tender for general service on the Pacific coast, $45,000; to enahle the Secretary of the Treasury to use revenue cutters for the protection of Government interests on Seal island and the enforcement of the law in Alaska, $20,000; for the appraisement and sale of the Fort Dalles Military Reservation in Oregon, and other abandoned military reservations, $5,000.

Nevada's First Nugget.

An interesting correspondence has lately passed between Eliot Lord, of the United States Geologic Survey, and John Orr, the first discoverer of gold in the State of Nevada. Under the supervision of the Director of the Geologic Survey, a history of

The Comstock Discovery

And mining developmente on the east slope of Nevada, is being prepared. Mr. Orr, at present residing at Duncan's Mills, Sonoma county, has in his possession the first gold nugget known to have been found in Nevada, and the inquiries of Mr. Lord have been in relation to the circumstances of its discovery, and the possibility of securing it from Mr. Orr, by donation or purchase, for the collection of minerals in the National Museum, at Washington. In conversation with Mr. Orr, a day or two ago, he stated the facts relating to the discovery. He started with a large train to come across the plains in 1849. Unusually severe weather was encountered, the roads were bad and they were compelled to spend the winter at Salt Lake. He left for California on the first wagon train from Salt Lake in the spring of 1850, but the desert was not crossed until the last of May, because of high waters, and the fact that their road had to be cut through the snow until the Humboldt was reached. Orr had a partner named Nick Kelly, after whom Kelly's ravine is named, and in the company was also one William Prouse, now living in Nurh City, about 40 miles southeast of Salt Lake. Prouse had worked in the mines in this State, before gold was discovered in Coloma, and was a good prospector. One early day of May, 1850, the train stopped on the edge of what is now known as Gold canyon, near the Carson river, to let the animals feed on some bunch grass found growing amongst the sage brush. Prouse at noontime took a milk-pan, and going down to the gulch, began washing dirt, in

A Few Minutes Getting Color

To the value of a few cents. Orr then named the place Gold canyon, still retained. Orr was keeping a rude chart of the country traveled over, taking bearings only north and south, and estimating the distances traveled every day. Gold canyon was marked on the chart which was lost by Mr. Orr in 1855, while returning East to be married. The train soon after resumed travel, going to the head of the Carson valley. There was met a party of seven, who had left the train at the sink of the Humboldt, intending to go in advance to California and select good locations for the remainder of the party. They had been unable to cross the country, and had been lost in the snow in the mountains four or five days, unable to find the divide to Hangtown, and seeking Carson to recuperate. A stay in Carson for three weeks followed, when Orr, Kelly and several others returned to Gold canyon and resumed prospecting. Kelly and Orr went up the canyon until a little fork was reached, when work was begun. The party had few tools, and

Orr Had Nothing but a Butcher-Knife.

While Kelly was working, Orr noticed a very narrow place at the fork, where the water barely covered a slab of slate rock. Idly he examined it, and noticing a small crevice near the edge, drove the butcher-knife into it, breaking out a piece. The water running over it washed away the underlying dirt, and in a few seconds Orr discovered a golden nugget where the rock had covered. It was quickly removed and afterwards found to weigh $8.25. This was on the 1st of June, 1850, nearly 30 years ago. Prospecting was continued, and though gold dust was found in several places throughout the canyon, Orr's was the only nugget found. The party lacked tools and provisions, and being bent on reaching California, abandoned the canyon and arrived at Leek Springs, July 4, 1850. Orr offered the nugget to Kelly, who refused to accept it, and as it was the first piece of gold he ever dug, Orr, for a few years kept it as a souvenir on that account. Of late years inquiry as to the

First Discovery of Gold in Nevada.

And the settlement of the discovery upon Mr. Orr and his nugget, have induced him to state that the nugget is not for sale, nor will it be donated to any museum. He has four grown sons, and will keep it for them, to be passed down as an heirloom. Mr. Lord writes that the survey in their contemplated work will acknowledge the first discovery as stated above. *Alta.*

Heating Boilers by Electricity.— We take the following from the *Electrician:* "Mr. Charles Davis, of Paris, has conceived the bright idea of heating ordinary steam boilers, by winding them spirally with platinum wires, and sending through the wires a current of sufficient strength to boil the water. Mr. Davis, however, has omitted to state how much platinum wire he will require, and whether he expects to buy it second-hand; also, how he is going to insulate his wire electrically from the boiler, and yet heat the latter; also, how he intende to produce the requisite amount of electricity, and lastly, at what cost per horse-power he intends to furnish the steam."

Action of Ozone on Metals.—Silver is said to quickly assume a coat of black oxide under the action of ozone. Gold and platinum, however, remain unaffected.

Arizona Placers.

The *Arizona Sentinel* says: Until very recently the attention of mining men from abroad has been directed principally to the more remote portion of the Territory; lately, however, it seems to have been discovered that extensive fields for profitable investments and lucrative mining operations have been passed over unnoticed in this immediate vicinity. That valuable mines of gold, silver, copper and lead, exist on both sides of the Colorado river and in close proximity to it, from this point up as far as the Great canyon, is a fact which we are pleased to notice has become patent to many who have sought points of investment hundreds of miles east of here without success. In addition to the many mines now in successful operation near town, there are other valuable discoveries being made every day; many of those mines and new discoveries are within a comparatively short distance of the river, thus affording advantages in the matter of economical working which a large proportion of the mines in the interior of the Territory can never enjoy. In addition to the numerous ledges of mineral, occurring throughout the mountain ranges along the Colorado, there are immense fields of placers that are beginning to attract merited attention; these placer fields may be found almost everywhere along the foothills of all the mountain ranges, and in the mesas and plateaus of the adjacent valleys, and consist of decomposed party and debris from the mountain, the depth of the accumulation being from a few inches to several feet. Papagos and Yackee Indians by their primitive method of dry washing have for years been obtaining gold in sufficient quantities to afford them ample sustenance, although only the coarser or heaviest portions are collected by their crude method of extraction—the fine particles, or flour gold, contained in the dirt, they cannot save. A knowledge of the existence of these placers, and their great extent, have induced a few gentlemen in San Francisco to organize a company, with a view to testing this dirt and gravel by actual work, and for the past month they have been carrying on their investigations upon the placer mesas along the Gila river at a point about 16 miles east from here; their working tests so far have shown that the dirt contains from 50 cts. to $1.50 per ton in fine gold. The company have secured by location large tracts for future workings, and the superintendent has proceeded to San Francisco for the purpose of procuring additional machinery, necessary for extensive operations on the Gila, but also in the vicinity of Plumoso, Agua Merva, Tyson's Wells and other points where the ground is almost unlimited in extent, and of greater richness than that which they have recently explored along the Gila.

More Gold Mines.

The gold camp ten miles east of this city no longer maintains a monopoly in the line of gold discoveries. Doe Cahezas has been chief, and its mines have been yielding the auriferous for years past. The Chericachuas have had spurts for excitements, and the Mule Pass mountains also hold valuable gold mines, but now comes like a meteor a new field that for brilliant, sparkling specimens, takes the belt.

The country is situated about on the boundary line of Sonora, a line that from current reports is not a fixed immovable line like the equator, but a line that is said to switch about like a cow's tail in fly time, from one side to the other, but always with the design to have mines on the Arizona side, so as to be regulated by our laws, and the mescal distillery on the Sonora side, where the U. S. Revenue laws can't "pull" them.

To be more exact these new gold discoveries are between the San Jose and Mule Pass mountains, in the foothills in line between the mountains. They were first discovered some time ago, and have been worked by Mr. Slaughter, the great cattle man, for several months, and an arastra has been in use to reduce the ore. And his mines upon the northeast point of the San Jose mountains, and the new discoveries are several miles away in the foothills towards the Mule Pass mountains. They were discovered by Peter Egloff, and located in connection with C. Anshutz and our friend "Kentuck." The vein runs northeast and southwest, is in quartz and lies in contact between granite and gneissoid slates, and averages, as far as shown, about two feet wide. We were shown an ore sack full of specimens, every one of which had gold specks on it, and some of them were rich. Many of the specimens had nuggets of gold in the quartz that showed as large as a grain of wheat. We took one specimen that showed no gold to the eye, and had it assayed by Mr. Bacou and got a result of $248.08 in gold, and $6.23 in silver. The veins are marked by an iron-stained black quartz cropping, and the ore is in a fine sugar-grained quartz with iron, and at times a little galena mixed in. Mr. Slaughter at his mine has a shaft 30 feet deep, and a vein from 2 to 3 feet wide and has good results from his arastra.—*Tombstone Nugget.*

The production of petroleum now exceeds 65,000 barrels daily. The stock in the United Pipe Lines is over 9,000,000 barrels, and notwithstanding 1,500,000 barrels of tankage are under contract and in process of construction by the lines, there is danger that they will not be able to take care of all the oil offered, and that some of it must run to waste.

Too Much Unprofitable Pumping.

Although by good management the Belcher, Imperial, Bullion and Yellow Jacket companies are able to handle all the water now flowing into their lower levels, it is beginning to be seen that it is a business that hardly pays for the outlay of coin, muscle and steam. Besides, it is full of risk. In order to handle this influx of water it is necessary to run the pumps so rapidly that there is great danger of breaking the rods. Such an accident would not only be expensive, but also would occasion delay and further complications. To run the hoisting tanks as rapidly as is now being done at the Yellow Jacket shaft is hard on the cables, as it is liable to cut the filling out of them.

It would be better to plug up all drill holes and reduce the influx of water as much as possible at every point, keeping it so reduced until the Yellow Jacket pumps are ready to start up. There is other work that can be profitably done in the interim. We understand that some of the drill holes, if not all, will to-day be plugged on the 3000 level of the Belcher.

This will relieve the Jacket and Imperial greatly. What with pumping water from the Bullion and with handling their own, the Imperial folks are just now in such a situation that it will not do for them to start another inch anywhere. The flow in the Bullion was a good deal increased yesterday at the point where the station is being cut out on the 2450 level, and things are now at such a pass that about the only occupation of the several companies of this group is the very unprofitable one of pumping water. The water cannot be economically handled, and all that can be plugged up and kept back should be so secured for the time being, as when the big pumps start up at the Yellow Jacket it can be snatched out in short order.

The first thing to be done at the Belcher is to connect the Crown Point on the 3000 level and get a good strong current of air into that sweltering region. This done crosscutting can be comfortably proceeded with. It is probable that the vein to the eastward of the main north and south drift will drain out by the time the connection is made with the Crown Point, even though all the drill holes are plugged, as there are many natural leaks that will bring out a great quantity of water. By bottling up the water on the Belcher 3000 level the pumps of that company will be able to relieve the Yellow Jacket folks to such an extent that they will be able to resume work in the bottom of their shaft.—*Virginia Enterprise.*

Locomotives and Conflagrations.—The great forest fires which have recently swept over thousands of acres in New Jersey were not all caused by sparks from locomotives, but it is alleged that several of them were, and especially one of the most destructive of those which made last week so terrible to the residents of New Jersey. The fact that many of the fires have raged along the line of railways is made one of the foundations for the assertion that sparks from locomotives were the origin of them. The oil fires of the Bradford district in Pennsylvania, too, are said to have been caused, in several instances, by sparks from locomotives, and it is plain that an investigation as to the part of locomotives in starting conflagrations should be made. If in seasons of drouth forests are much imperilled by passing locomotives, especial precaution should be provided against the evil, and some system of protection against fires from locomotive sparks should speedily be devised and adopted in the oil regions. If investigation reveals that fires from locomotive sparks are more frequent than has been commonly supposed, the fact will suggest an important opportunity to inventive genius. How to construct a locomotive so that the emission of dangerous sparks will be impossible, is a question which some inventor may find profit in pushing to an investigation it has not yet received. The owners of pine and cedar groves in Ocean, Burlington, Atlantic, Cape May and Cumberland counties, New Jersey, are especially eager for inventive activity in that direction.—*N. Y. Mail, May 10th.*

Mining Rulings.—A Washington correspondent of the Salt Lake *Tribune*, writing to that paper, says: The Commissioner of the General Land Office, in reply to a letter from Park City, Utah, says he knows of no law which exempts unpatented mining property from execution, and that the United States mining law does not prohibit the same party from holding more than one claim on the same lode. The Land Commissioner says, in reply to a letter from Idaho, that a party is not authorized to go within the claim and possession of another party and discover a ledge on which he may base a location. Hence his location would be void, and so far as this office is concerned, the location of a third party upon a ledge outside the first location but within the second, would probably be recognized as legal. The matter, however, would doubtless be adjudicated in the courts whose decision this office would only be called upon to execute in the event of application for a patent. Second—A locator's record should conform to the actual location on the ground and the only proper method to correct a mistake in this matter would be to make a new record. Third—It cannot properly be stated just how far a locator may deviate from the plain requirements of section 2,624 of United States Revised Statutes in making his location and yet save his claim. Strict compliance with the law is the only security with a locator.

Improved Method of Diving and Staying Under Water.

The apparatus now in use for supplying air to divers engaged in sub-marine operations is both cumbrous and unsafe, the air-tube limiting the movements of the diver, and, by its liability to become entangled and crushed, causing a risk that the supply of air for respiration may be cut off altogether. A new method, in which these drawbacks are escaped by dispensing entirely with the air-tube and pumps, has been invented by a Mr. Fleuss in England, and lately exhibited at the Royal Polytechnic Institute in London. Dr. B. W. Richardson was given an opportunity to closely watch its operation, and from his description we glean the following account of the experiments: The peculiarity of the method consists in the diver taking a full supply of air-food down with him, which dispenses with pumping, no help being needed except a signal-man and cord. Mr. Fleuss is both inventor and diver. He descends into the water in an ordinary diver's dress. It consists of helmet, breastplate and common water-tight armings and leggings. On his shoulders he carries a weight of ninety-six pounds, and on his boots twenty pounds. A light cord is attached to the helmet for signaling to the person above. Before the mask is closed and the helmet adjusted, an "ori-nasal mouth-piece," with a breathing-tube of an inch bore proceeding downward, is firmly tied over the mouth and nose. Dr. Richardson carefully observed two experiments, one of twenty minutes' length, and another of an hour; and was assured by the diver that when under water he breathed as freely and easily as in the air. This was confirmed by his appearance and condition at the end of the longest experiment. He moved about the floor of the tank, picked up coins, and could lie down and get up without difficulty. The exact mode by which breathing is effected Mr. Fleuss declares to be simple, though it still remains a secret; but it is wholly carried on within the apparatus, not even the expired air becoming apparent in the water. The facts demonstrate that, without assistance from above, a man who has had no previous experience of diving or remaining under water can take down with him sufficient oxygen to live there easily for an hour; and but for the cold the diver asserted that he could have remained another hour and a quarter, and that he could easily arrange to remain four hours. Depth he said would make no difference as to breathing within the apparatus. Dr. Richardson is enthusiastic over the practical possibilities of the discovery. If a man can thus take his stock of breathing material with him and live for hours without external access of air, he may extend the field of his industries and investigations into the deep sea, or the most rarified atmospheres, into mines filled with choke damp, or amid the suffocating smoke of conflagrations, without fear of consequences.

Mining Resources of Amador County.

Amador county, named like other counties of this State, after one of the early California families of Spanish origin, has El Dorado county on the north, Alpine on the east, Calaveras on the south and San Joaquin on the west. It has a conformation long and narrow, in its geology and topography. In soil, climate, timber and other natural resources, it is unexcelled. The proportion of farming land is great. The eastern section of the county is very rugged and broken, reaching an altitude of between four and five thousand feet. In a metalliferous point of view it is for its size an important county, a belt of auriferous earth and rock about twelve miles wide running entirely across its lower and more populous part. Along the westerly edge of this belt rest the *vera madre*, in which lie some of the most profitable and largely productive quartz mines in the State. Quartz mining is full of of instructive and encouraging lessons to all who are now engaged or who may contemplate engaging in it. It has already been explained that there is one leading quartz vein, or rather system of veins, running longitudinally across and very near the center, laterally considered, of the great gold-bearing belt of California. There are other subordinate groups of veins running parallel to and on either side of the main vein, the distance separating them varying from two or three to ten or twelve miles. Although the intervening space frequently contains valuable lodes and masses of quartz, the most largely productive and permanent deposits of auriferous ore are usually found along these parallel channels, occurring in bunches known as chimney, or chutes, which are very unevenly distributed, apparently without reference to system or regularity, as some portions of these veins are rich in precious metal, while others are barren—even all semblance of a lode for a long distance entirely disappearing. This grand central vein is generally called the mother lode. In stating that this lode is more productive than any other, it is meant that it affords a greater amount of pay rock, and it can be extracted at less cost than that found in smaller veins, encased in harder varieties of metamorphic rock; not that the ore is of richer quality, as it is in fact of a lower grade than California ore generally. With this much of premise, it will be understood that the operation of quartz mining and milling is confined to certain belts of the State, though occasionally extensive and profitable fields for carrying on the business present themselves in regions far removed from the mother lode. These are termed outside districts.

Oregon Mining Interests.

We take the following from the *Bedrock Democrat:* Important as the miniag interests are to every one in Baker county, in fact in all eastern Oregon, it must be exceedingly gratifying to them to know, that with the opening of the season, extensive operations are being commenced in more than one of the very largo and valuable tracts which Eastern capitalists have of late sought for investments.

During the week we noticed that the Placer Gold Mining Co. of eastern Oregon had commenced work on their splendid property on Clarks' creek. This company have acquired a very extensive and valuable claim, comprising 384 acres and including over 40 miles of ditches, with an exclusive ownership in all the water rights and privileges, thus giving them entire control over anything of value in that locality.

It is several years since first experienced miners discovered the great richness of this locality; but curious as it may seem, but few have prosecuted the discovery with any vigor; notwithstanding this, it is a well established fact that in no single instance where developments have been made have the parties failed to obtain the most substantial results; out of what might be esteemed even insignificant claims, reasonable fortunes have been acquired, and every test has established the fact that the richest deposits of Baker county lie at the disposal of this company awaiting development.

The resident manager, Mr. Wm. D. Kennedy, is pushing forward operations with that energy which is characteristic of Chicago men; the repairs and enlargement of the Clarks Creek ditch are almost completed, the piping is being set in place, and two "giants" will shortly demonstrate the power of hydraulics. The large ditch, known as the Burnt River ditch, is also to be put in complete order, and though this work will involve considerable outlay, yet the investment will be a mere bagatelle compared with the revenue which must accrue from the thorough equipment of this great enterprise.

While from the narrow-minded standpoint of some, it might be a source of regret that the splendid results which undoubtedly must flow from this magnificent enterprise should fall into the hands of the irrepressible Chicagoan, yet to us it as a matter of sincere congratulation that at last vim and energy are to supplant lethargy and apathy, and the untold wealth of eastern Oregon brought to the surface by that same pluck and grit which burned down and rebuilt one of the liveliest cities in the universe in about the same time that it would take the average Oregonian to arrive at a well-conceived idea. We say God speed to all who come among us in association with legitimate enterprise, and to none that have so far come can we so cheerfully extend a welcome as to the company above referred to; its directory is composed of "solid men"—men whose names are a credit and endorsement to any company. We may have more to notice in this connection.

RAMSEY'S CANYON.—Mr. Jas. McGarey came in town last evening, just from Ramsey's canyon. He and partners have a number of claims there which make a fine showing. The ledges are large and well defined, carrying principally silver and copper. On the Central mine they are down 20 feet, and assays made recently give returns of $181.45 in silver. The copper glance carries $183.03 silver and about 70% of copper; this is a recent discovery. The Green Carbonate mine carries in silver $162.61 and 25% copper. Another late discovery is called the Gold Quartz, and carries gold and silver, principally the former, $17.11. Wood, water and grass are plentiful, the district in respect to these advantages being one of the most favored in the Territory. The veins give every evidence of permanency, and even if no increase is obtained in richness of ore in most of them a fortune is assured to the owners. W. E. Garrett, one of Arizona'e pioneers and an experienced prospector, is quite an enthusiast and feels that he is now on the eve of realizing upon his years of toil in the Territory. Considerable work is going on and there is not an idle man in the camp. Ben Williams, Esq., is there working a force of men on the Wisconsin mine, the sale of which was lately mentioned as being made to an incorporation of Eastern men and our own citizens. We understand that $25,000 has been set aside for the erection of furnaces.—*Tucson Record.*

A NEW ORE BREAKER.—There is being erected at Maltman'e sulphuret works near Nevada City a Forster combined ore crusher and pulverizer, which arrived Sunday from the manufactory at Pittsburg, Pa. It will be ready to start up next week. It is an exceedingly simple piece of mechanism, but to the eyes of a casual observer appears to possess those features so long sought for in connection with dry crushers. Geo. G. Allen of the Nevada foundry is agent for the Pacific coast for the machine. The one received will be in operation next week. If it proves a success, Mr. Allen will probably begin the manufacture of them, the cost of transportation across the continent being too great to admit of their introduction otherwise. The whole affair is very compact, being only six feet in length. The manufacturers claim that the different sizes will break and pulverize from one to three tons of ore per hour.—*Nevada Transcript.*

USEFUL INFORMATION.

Judging about Sizes, Distances and Hights.

Every observing person must have noticed that our judgment in regard to the size, distance or hight of objects is often erroneous, in case we are not familiar with either of them. Usually it is an under-estimate—that means, we think the object smaller, nearer, or lower than it really is, and this fact explains a great many peculiarities which have been the subject of dispute. Such as why the moon looks larger when near the horizon than when high up in the sky. The reasons of this and many other illusions about size and distance are as follows:

Man is accustomed to move on the earth's surface, and in this way trained to judge about distances and sizes as long as they are seen in a horizontal or nearly horizontal direction. But as soon as they are seen far above or deep below, he is at a loss to judge, and more so if no intermediate object furnishes him a scale to judge by.

A man of ordinary hight, say 5½ feet, is, at a distance of 315 feet, seen under an angle of one degree; and when he is on the ground, in a horizontal direction from us, so that we can judge of his distance according to our experience, he will appear of ordinary size; but if he is seen under such surroundings as to make him appear farther off, he will appear taller, as experience has taught us that when a man is farther off than 400 feet and seen under an angle of one degree, he must be above the ordinary size. We judge, as it were, instinctively about this, without thinking about actual distances or angles of one or more degrees. Place this same man high up on a tower or other elevation, without changing his distance of 315 feet from us, and we will no more realize the distance he is at, but under-estimate it by the absence of intermediate objects; and having the impression that he is nearer than he really is, he appears to us quite small, as experience has impressed us that a man must be uncommonly small when he is so near and seen under so small an angle. We do not think, and much less calculate about it, but judge by the more superficial impressions, because when we investigate and begin to reason about it the illusion disappears in most cases.

It is easy to give illustrations of this general principle. A flag, wind-vane or other ornament on a tower or other very high building, is always much larger than it appears from below. Very few people believe that the arrow serving for a wind-vane on the postoffice, New York, is 16 feet long; the men working at the suspension bridge over East river look surprisingly small to such persons as are unaccustomed to see very elevated objects. The Palisades along the Hudson river are always under-estimated in regard to their hight by those who see them from a distance and do not realize the great width of that river; they therefore judge them to be, say, about 100 to 150 feet high, but when their attention is called to the two and three-story houses at their base, and which they at first think to be dog kennels, they have a base of comparison, and at last recognize that the hight must be 400 or 500, and in some places 600 feet, a hight which is only fully recognized when ascending one of the pathways leading to the top. Some of the most striking illustrations of this illusion are found along the banks of the river Rhine, in Germany, where in some of the colossal quarries, the men at work look like mere pigmies, for the simple reason that the distance of the mountain is under-estimated, and consequently its hight, and also that of the men.

A SELF-LEVELING berth, is the new name given to a novel device, which the inventor thinks will do away with sea-sickness to the person who occupies it. One of these devices is about to be tried on a steamer from New York. A paper of that city speaks of it as follows: A few days ago a company was invited to visit the *City of Alexandria*, in the harbor of New York, into which the new contrivance has been introduced. The spectators of its working were satisfied that it was a success. These berths are of the ordinary size. They are attached both above and below to universal joints, and are weighted underneath by crescent-shaped cylinders of iron. This arrangement is designed to keep the berths perpetually level, no matter what angle the vessel herself may take. To further maintain the berths in their orbit, and prevent sudden changes of position, they are provided with spiral springs. It is said to be the intention of the company to which the *City of Alexander* belongs to introduce these berths into all its vessels. A few years since a ship was built in London with its entire cabin constructed upon this principle; but it proved a failure as a ship, met with disaster on its first trip, and was never tried as a test for the working of its self-leveling cabin, or the effects of that principle in avoiding sea-sickness. It is the opinion of the writer that the sea-sickness comes chiefly from the lifting and dropping of a vessel in a rough sea, and that consequently a mere self-leveling cabin or berth will have no effect in preventing sea-sickness.

A BUILDING OF PAPER.—The dome of the Troy Polytechnic Institute's observatory is 29 feet in diameter, and made of paper, reduced by pressure to the hardness of wood, and one-sixth of an inch in thickness. Its weight is only one-tenth of the usual material, and it is so nicely adjusted that a child can turn it.

HOW SHEET LEAD IS MADE IN CHINA.—The making of sheet lead for the lining of tea chests, etc., is a somewhat important industry of Hong Kong. It is made principally in sundry establishments to the westward. On entering one, workmen will be seen with shears busily employed in cutting out the sheets of lead into the required sizes and shapes. The shears are simply a large pair of sciesors, firmly fixed to a solid block of wood some two feet in hight. The lower blade of the shears terminates in a square piece of iron, instead of being pointed, as is the upper blade. The sheets of lead will also be observed to be of small size and somewhat irregular in shape, and this arises from the method of manufacture, as will subsequently be seen. Going further into the shop will be seen an iron pan raised 12 inches or so above the ground and carefully finished off. Beneath this iron pan is a furnace, and at the side of the pan next the wall is the flue communicating with it. In this pan the lead is melted, and when judged to be hot enough, the workman takes two of the large square paving tiles, which may be seen almost anywhere in the colony, and these are then smoothly and carefully covered with several layers of unsized paper. Having placed these two tiles before him, one above the other, the workman raises the upper tile with his left hand, and, taking a ladle of the proper size in his right, he dips it in the melted lead and then pours its contents on to the lower tile. He then drops the upper tile and quickly presses the lead out into the form of a sheet. The paper being a bad conductor of heat, the lead does not solidify immediately it leaves the ladle, and, as by long practice the workman always ladles out exactly the same quantity of lead, the sheets made vary but little either in size or thickness.

THE HUMAN EAR.—Imagine two harps in a room, with the same number of strings, and each string perfectly attuned to a corresponding string in the other. Touch a string in one, and the corresponding string in the other will give out the same sound. Try another string, and its corresponding tone will be sounded. So with all the strings. So with any combination of the strings. It would not matter how you played the one harp, the other would respond. No doubt the response would be weaker. That is what one would expect; but the response, as regards pitch and quality, would be almost perfect. Now, substitute for one harp a human ear, and the conditions would, according to theory, be the same, except that the responsive mechanism of the ear is much smaller than that of the responsive harp. In the ear there are minute chords, rods, or something, in such a state of tension as to be tuned to tones of various pitch; sound a tone, its corresponding rod or chord in the ear will respond, perhaps feebly, but still with energy sufficient to excite the nerve-filament connected with it; the result is a nervous current to the brain, and a sensation of a tone a particular pitch.—*Good Words.*

GOOD HEALTH.

SUGGESTIONS TO FAT PEOPLE.—No doubt it is unpleasant to be exceedingly obese; but the morbid dread of fat which has in recent years become fashionable, has, according to the London *Lancet*, no foundation in physiological fact. Fat answers two purposes; it acts as a non-conducting envelope for the body, and protects it from too rapid loss of heat, and it serves as a store of fuel. In the course of exhausting diseases it not unfrequently happens that the life of a patient may be prolonged until the reserve of fat is exhausted, and then he dies of inanition. Fats supply the material of the heating process, on which vitality mainly depends. In great excess it is inconvenient; but the external layings on of fat is no certain measure of the internal development of adipose tissue; much less does a tendency to grow fat imply or even suggest a tendency to what is known as "fatty degeneration." It is time to speak out on this point, as the most absurd notions seem to prevail. Again, it is not true that special forms of food determine fat. That is an old and exploded notion. Some organisms will make fat, let them be fed on the leanest and scantiest and least saccharine description of food, while others will not be fattened, let them feed with the most "fattening" of diets. The matter is one in regard to which it is supremely desirable and politic to be natural, adapting the food taken to the requirements of health rather than substance. Simple food, sufficient exercise and regular habits, with moderation in the use of stimulants, compose the maximum of a safe and healthy way of life.

SPRING DISEASES.—A very large amount of the discomfort, lassitude, depression and actual sickness which prevails in the spring can be modified or wholly avoided by the exercise of a little reflection and self-denial. One of the main objects of eating in winter time is to keep us warm, and to that end, provident nature gives a vigorous appetite in cold weather, but if as warm weather approaches we eat with the appetite of winter, the system not having time to adapt the appetite to the temperature, mischief will follow as inevitably as if a locomotive is diminished in speed one-half while the fires are kept burning as fiercely as when it was moving at the utmost allowed rapidity. A prompt diminution at each meal of one-third of the amount eaten in winter, beginning before April in the latitude of New York, and earlier further south, would diminish spring diseases to an incalculable extent.—*Ex.*

Women's Tendency to Obesity.

A year or two ago the New York *Times* started the question, Are not American women losing their thinness? and expressed the belief that they were losing it steadily and perceptibly. Observation shows that it is so, especially in large cities, where there is more ease and material comfort, more freedom from anxiety and petty care, than there can be in the country. Our women do not look as they used to 25 or even 15 years since. Their proportions have visibly increased, as most any one may see who will use his eyes. New York will serve as an example. Formerly, a really stout woman there was pretty apt to be a foreigner. Now, stout native women are very common, well-nigh too common to be agreeable. And round plump women of Anglo-Saxon blood and origin are conspicuously plenty. They are numerous on the promenade, at places of amusement, at private entertainments. Fullness of contour is no longer the dividing line between other nationalities and our own. We are getting more and more like the rest of the civilized world.

The pallid complexions, narrow chests, flat bosoms and angular figures of which we were wont to hear so much, are now hardly perceptible. They diminish every year, proving that the general health of the country is far better than it has been, and that we more clearly understand nature and nature's laws. The present danger is that women may acquire more adipose matter than may be attractive. The tendency is obviously in that direction. It may not be a great while before they shall compete in corpulency with their English, French and German sisters, not to name those of other lands. It appears to be the rule that women, in and after middle life, grow stout when they are comfortably circumstanced and mentally at rest; and there is no manifest reason why Americans should be an exception. We hope they will stop short of European redundancy (any degree of thinness is preferable to obesity), but whether they do or not, the meagerness of the daughters of the Republic is unquestionably a thing of the past.

IS SMOKING INJURIOUS?—The excessive indulgences in any appetite is injurious, but it has long been a question whether the moderate use of tobacco in any of the customary forms is attended with deleterious effects. Here is an item on this head that can be taken for what it is worth: At Yale college each class is graded in divisions according to scholarship, the best scholars being in the first, and so on down to the fourth, where they are rated "not too good," "yet good enough" to keep in the ranks. In the Junior class it was found that only 10 out of 40 in the first division were addicted to smoking; 18 out of 37 in the second; 20 out of 27 in the third, and 22 out of 26 in the fourth. The proportion of smokers, it will be observed, increases in regular ratio with the falling off in scholarship. The inference is against the smokers, but it is not certain that there are not other causes to account for the falling off in mental ability. It is not unusual for people to reform their vices as they grow older, and this might to some extent account for the advance in scholarship of the first division of the Yale junior class.

CLEAN BEDS.—A writer in the *Congregational* writes intelligently on this topic and on clothing as follows: "It must be a false idea of neatness which demands that beds should be made soon after being vacated. Let it be remembered that more than three-fifths of the solids and liquids taken into the stomach should pass off through the pores of the skin—7,000,000 in number—and that this escape is the most rapid during the night, while warm in bed. At least one-half of the waste and putrid matter (from 20 to 30 ounces in the night), must become more or less tangled in the bedding—of course, soiling it—and a part of this may become re-absorbed by the skin, if it is allowed to come in contact with it on the next night, as it must if the bedding is not exposed for a few hours in the air and light. We may well imitate the Dutch example of placing each bedding on two chairs near the window, in the sunlight; or in the window, that the best purifier known—the light of the sun—may dissipate their impurities, or neutralize them. At least three hours on the average is as short exposure as is compatible with neatness."

GLYCERINE IN DIPHTHERIA.—According to *Medizin Zeitung*, of Vienna, Prof. Clar's success with the use of glycerine in diphtheria admits of no doubt. He first prescribes a gentle aperient, either in the form of a manna draft, or of a few grains of calomel, which last he holds to be a powerful antiphlogistic remedy, and when properly used, of great value. Coincidentally he directs cold compresses or cloths to the neck and head, or even to the chest, carefully renovated according to the elevation or depression of the temperature, cold or iced water being at the same time given as a drink, and then commences at once the use of iron-glycerine, which consists of two ounces of anhydrous glycerine and 20 drops of the liquor sesqui-chloride of iron. Of this mixture, half a teaspoonful is given every half hour throughout the day and night. As soon as the symptoms appear to be mitigated, the quantity is diminished to a teaspoonful every second hour, and in the intermediate period, a mixture composed of glycerine two ounces, borax two grains, is similarly given by a teaspoonful at a time. The iron-glycerine is progressively given at longer periods, and is gradually replaced by the borax-glycerine.

The Week.

Delightful weather has been the charming feature of the city dnring tbe week. From all parts of the State come the cheering news of a hounding activity on vineyard, and farm and in mining camp; and a prospect of a rich harveet of grain and fruit and an increased yield of gold from placer, gravel-bank and quartz vein, bas seldom heen better. Indeed, so auspicious is the season that the yield of the great products of our State bid fair to eurpass that of any former year. Some elight damage may be done to grain by the fierce "norther" which has hlown for two days, and extended along the coast several hundred milee and ewept over the hroad valleye of the State. The "norther" occurs regularly in May. It ie not an unmixed evil, and has been well characterized as a "fly. ing sanitary commission." The hot dessicating wind ahsorhe a vast amonnt of precious water, hut it also licks up and dries etagnant and miasmatic pools and thus removes the eource of diease and death. Rain may follow the norther, and canse some fluttering to the alwaye anxious baymaker.

It is a noteworthy featnre that mining operations over the entire Pacific slope are carried on with renewed vigor and intelligence, and our mining summary will he found full and interesting.

The most notable and the saddest event of tbe week was the fatal wrecking of an excurseion train on the S. P. C. railroad, on Sunday 23d inst., by which 18 persons were killed and 40 odd eeriously wounded. The cause of the disaster is now under investigation.

The proceeding hefore the Superior Court to impeach Mayor Kalloch for alleged misdemeanor, wae dismissed on Thnrsday, on the ground that the acts alleged were not done in his official capacity.

The shipments of bullion and the condition of the mining share market will be found in the proper columns.

Mining and Railroad Shares.

That there has heen and still is more or less prejudice among men in the Atlantic cities against mining shares, either as a means of speculation or as an investment, is a patent fact. The men who delight in ventures in railroad stocks, look with distrust on the shares of even the hest managed and successful gold or silver mining company. Why should this prsjudice exist among Eastsrn capitalists? Is there any inherent quality in the business of mining for gold, silver or copper; any peculiar ethics in the management of a gold or silver mining company, or in the manipulation of its stock, which renders it less securs as an investment, or the chances of profit in speculating in its shares less than in railroads? This prejudice is peculiar to American capitalists. It certainly does not exist in England, the center of capital, and our great commercial, manufacturing and mining rival; for her capitalists have sought for investments in the gold and silver mines of every country (ws hold a pretty sum of British cash on that account,) and the mining stocks of the world are quoted daily at the exchange in her capital. This prejudice must arise from habit. Eastern men are used to railway stocks; they are not used to mining stocks. Some thoughtless people say that there are fluctuations and uncertainties attending gold and silver mining operations and ventures in mining ehares which do not attach to the railroad business; hut a little time devoted to a comparison of the two enterprises, hoth as regards their ahility and profitable results, would not sbow to the disadvantage of mines and mining eharee. What is the present condition of the railroad etock market? Have its fluctuatione and uncertainties ever been eurpassed hy the mining etock market? The railroad stock market, remarks the Boston *Economist*, "is evidently in a had way. After nearly a year of inflated prices, reaction has come, and for weeke the papers have heen talking ahout the great depression, as if it was some sort of geological or atmospheric phenomenon. The fact is, the market is flat—not alone hecause it is hammered so, but hecause it has been found impossihle longer to sustain the prices of last autnmn and winter. In view, then, of thie general collapse along the line of railroad stocks, would it not he well for investors to turn their minds to mining securities? Here ie an almost fresh field for investment or speculation, which, with a yearly bullion product of $100,000,000 as a hasis, and securitiee selling at one-half or two-thirds their actual value, ought to be a tempting one.

Bad Timbering.

It behooves miners to he as carefnl ahout timhering while only opening their mines, as when everything ie in good working order. After a mine has been partly opened, but insufficiently timbered, if new people take hold of it they must, to put tbe mine in proper shape, retimber it. Mine owners wbo allow otbers to work under a lease, sbould look sbarp after them in this respect, for they almost always have the eole ohject in view of working out a pocket, and getting the money as eoon as possihle, rather than looking for future developments.

Capitalists don't run very hard after a mine in which it will he necessary for them to replace every timher hefore getting any returns, or heing ahle to work the mine systematically. Judicious work in timhering is a very important conederation. These facts are just heginning to he realized in eome localities. The Georgetown (Col.) *Miner* says that if all the profitable mines in Clear Creek county had been timhered on the same hasis as the Freeland, onr mining interests would have presented a very different aspect at the present time. It is nseless to conceal the fact that amid a general desire to accumulate wealth rapidly, without the least considerathone of suhsequent development, the timbering of eome excellent mines in this locality has heen sadly overlooked. The consequence is that a number of minee which have yielded handsomely, and would continue to do so with proper development, are now dormant from the fact that an enormous expense would he incurred hefore they could he placed in a secure condition for further workinge.

THE HOARDING OF SILVER.—The pressure of the silver hoard in the vaults of the National treasnry must, it would seem, find further scope before long, either in additional vaults or in the stream of husiness and commercial activity. On the 22d inst., Secretary Sherman sent to the House of Representatives a letter from Assistant Treasurer Hillhouse, at New York, giving the information that tbe additional amount of silver he can receive will not exceed $10,000,000, which amount, added to the eum on hand, would give a total of $28,000,000. The silver now in the vaults of the treasury at New York weighs 500 tons. Mr. Hillhouse adde: "I take the liherty of calling your attention to the matter, as there seems to he no disposition on the part of Congress to etop further coinage of silver. If it is to go on at the rate of $2,000,000 a month, the question of how we are to dispose of it with our present facilities will soon he a pressing one."

Arizona.—No. 5.

The principal tributary of the Colorado is

The Gila

Which rising in New Mexico flows westerly in a devious course of npwards of 400 miles until it joins the Colorado at Yuma, thus dividing ths Territory into two unequal portions. At various points along its course, notably at Florence, are considerahle tracts of rich agricultural lands which have yielded abundant crops wherever they have hsen brought under irrigation.

The chief conflusnts of the Gila are ths San Pedro on the south and Salt river on the north, the former rising in Sonora and flowing northwesterly about 130 miles, empties into the Gila ahout 40 miles ahove Florsnce. Although ths lands along its horder are not anywhere excslled in fertility, thsy are especially noted for the prevalence of a species of fever and ague which for a portion of the ysar almost prohihits ths presence of white residents. It is believed, however, that the disease is here especially virulent on account of the heavy growth of indigenous canss, gourd vines and willows, and that it will gradually disappear as thess are rooted out to make room for wheat fields and orchards.

The Salinas

Or Salt river is especially interesting in view of the facts that it drains a most prolific mineral region and that its agricultural lande are the most extensive and important of any in the Territory. It is so named becanse of the hrackishness of the lower portion of its etream, caused hy several groupe of ealine springs which are located and discharge iuto it at various points along ite course, the principal of them being oppoeite the northern hase of the Apache mountains. The salt in this stream ie not found to he in the least prejudicial to ite use for irrigating, while those accuetomed to drinking it prefer it to any other.

This river runs nearly due west and is formed hy the junction of a numher of streams draining the plateau region of northern Arizona. The chief of these are Black river, with Bonita fork, White river—rising in the White mountains—Carrigo, Cihicu, Canyon and Cherry creeks. West of these comes Tonto creek, draining Tonto basin, a promising mineral region, and finally the Rio Verde, a considerahle stream from the northern mountains.

The foregoing northern confluents of Salt river have longer courses and drain a larger country than do Pinal, Pinto and other southern tributaries. From the mouth of White river to Pinal creek, a distance of some sixty miles, tbe river flows through hox canyons; it tben widens out, forming a considerahle and quite fertile valley running down as far as Tonto creek, ahout 12 milee immediately helow which it is again confined in a very rugged canyon formed by the juxtaposition of the main peaks of the Superstition mountains on the eouth and a prominent cluster known as the Four Peake on the north. Thence released it flows on through an improving section to the thriving settlement of Tempe, receives the waters of the Verde, smiles on the fields of Phœnix and reacbes the Gila.

Other trihutaries of the Gila are San Carlos creek, rising in the White mountains near the Black river, and uniting with the Gila at San Carlos, the head-quarters of tbe Apache reservation, Aqua Fria creek, which, flowing likewise from the north, joins tbe main river at the northeastern angle of the great hend, near the confluence of Salt river, and Haseayampa creek, also from the north, its mouth at the northwest angle of the great bend of the Gila. The two last creeks, running, respectively, west and east of the Bradshaw mountains, drain the mining region south of Preecott.

The Santa Cruz river rising in Sonora, and the Sonoita and Sopori creeks, drain the region of the Santa Rita, Patagonia, Atascosa, and other mountains south of Tncson, and their valleys contain much fertile and some wooded land. Notwithstanding the confluence of some other creeks, the Santa Cruz sinks and is lost in the plaine a few milee northwest of Tucson, hut is supposed to run underground in a northwesterly direction from thence to near Maricopa Wells, on the Gila.

The larger portion of the minee hitherto developed, and the most important agricultural districts, are situated upon the Gila and its confluents.

For more than a hundred milee north of the Gila, the arid plaine of Arizona are nnwatered hy a eingle permanent river. The Bill Williams fork which joine the Colorado at Aubrey, is formed by the junction of the Big Sandy from the north, and the Santa Maria river and Burro creek from the northwest, and in its lower course rune parallel with the Gila. The remaining confluents of the Colorado belong to the plateau and canyon region of northern and northeastern Arizona, and are Kanah Wasb from the north, and Cataract creek and the Colorado Chiquito from the eoutb. The latter, a considerahle river, with numeroue affluents, has its head-waters in the White mountains near those of the affinents of Salt river, and is hordered in its uppsr course by land sufficiently fertile to entice numerous families of Mormons and Gentiles to eettle thereon. Its course is southeast to northwest, and it is more than 200 milee in length.

Description by Counties.

In order to give a hetter idea of tbe extent and varied character of the conntry, a short description of eacb county, including a sketcb of its towns and settlemsnts, and hrisf mention of its chief mines and lsading agricultural resources, will he given.

Arizona is divided into seven countiss—Yavapai, Apachs, Mohave, Yuma, Maricopa, Pinal and Pima. Its principal towns ars Tucson (capital of the Territory and of Pima county), Prsscott (for a sbort tims tbe seat of govsrnment of the Territory, and the county sest of Yavapai), Phœnix, Yuma and Florence (the county seats of Maricopa, Yuma and Pinal counties respectively) and ths new mining settlement of Tombstone, in Pima county.

Extensive plscers exist in the Santa Rita mountains, and over large areas in the western part of the country, notably in the vicinity of Gila City. But the difficulty of introducing water has hitherto prevented their bsing worked, excspt in a small way hy Indians and Mexicans, hy dry washing. A company, recently organized in this city, is now engaged in experimsnting with a dry washing machine on the gravsl nsar Gila City with the most flattering prospects of success. Should any means of handling profitably in a dry way the auriferous gravsl deposits of the Territory bs devised, enormous increase of the bullion product would he the immsdiate result.

Pima

The greater portion of southern Arizona is included in Pima county, which runs northward to the Gila at its eastern extremity, but for most of ite length is eeparated from that river hy Pinal and Maricopa counties. Its weetern extremity ie somewhat eimilar to the Gila bottom, hut its central and eastern portions are mountainous. Its chief rivers are the San Pedro and Santa Cruz; its chief valleys those of these rivers, and the Sulphur Springs and San Simon valleys. In this, the most populous county, are the oldest as well as most of the newest mines of Arizona; and the oldest and newest of the large towns. The valleys, especially those of the San Pedro and of the Santa Cruz, are very fertile, aud the mountains hear a tolerahle supply of timher. The mineral resources of the county are enormous and varied including gold, silver, copper, lead, coal (at Arivaipa canyon), salt, gypsum, etc.

The oldest, largest, and in many respects most interesting of Arizonian towns, is Tucson, formerly the Presidio de Tuquisou, founded certainly not later than 1769, and, according to some accounts, older than New York. The valley around is said to have been eettled in 1560. Tucson, the capital of the Territory, is situated upon the Santa Cruz, and probahly now contains about 8,000 people, a large proportion of whom are Mexicans. The streete are narrow, and the houses, except the more modern ones, are one-story adohes, while tbe Mexican part of the population is to a great extent picturesquely dirty and thriftless looking. The Mexicans ehow little of the pure Spanieh type, having the hroad, red face, which speaks of Indian blood. Now that the railway is opened, population is rapidly pouring in from California, and much of the merchandise comes along the railway. Previously all merchandise came over the horder from Sonora, a far more practicahle route than across the Colorado desert from California.

South of Tucson, and etretching thence eastward is a considerahle tract which for more than a bundred years has heen cultivated hy the Papago Indians. Some of the farms have heen continuously worked during tbe whole of this period, and as yet sbow no signs of exhaustion, producing two crops every year.

Oranges, lemone, figs, almonds, and all the fruits and nuts of the tropics and semi-tropios can be grown here. Water is obtained from the Santa Cruz river, and, where this is not available, by sinking artesian wells. Within the Papago reservation, and about nine miles from Tucson, etands still in tolerahly good preservation and used for divine service, the old Mission San Xavier del Bac, one of the three founded hy the Jesuite for the conversion of the Indians.

The Papagos, who reside in southern Arizona and northern Mexico, are a superior tribe of Indians; and those who were converted hy the Jesuit fathers etill remain faithful to the Catholic church, and have besn hy their hravery and trustworthiness the chief hulwark of the town of Tucson against tbe treacheroue Apache. They numher ahout five thousand. The valleys south of Tucson are fertile, and the mountaine wooded. Besides the valley of tbe Santa Cruz there ie the Sonoita valley, twenty to twenty-five milee long, and covered with a heavy growth of timher, ash, cottonwood, etc. Orchards succeed well in thie valley; apples, peaches and pears have heen planted, and thue Tncson can he supplied with temperate as well as with tropical fruits. Hay-ranches and gardens extend for some miles along the road from Tucson to Mariposa.

GROWTH OF YOUNG PINES.—It is encouraging, says the Reno *Gazette*, to observe that quite a thrifty growth of youngpines is springing up on the mountains between Steamboat and Virginia. In most places they have attained a hight of 20 feet. Higher on the sides of the canyons they grow more slowly, and gradually dwindle in eize and numher until, at a line about 7,000 feet ahove sea level, they disappear almost entirely. There are very few cedar or fir shoote coming up. These mountains were covered with trees 20 years ago, but all bave disappeared, and even the etumpe and roots have been grubbed np by the Italians and Chinamen.

Hydraulics.

(Written for the PRESS by A. MYERS, Hydraulic Engineer.)

The subject of hydraulics is of greater importance to this coast than perhaps to any portion of our Union. First, because of the scarcity of water during a large portion of the year; second, because of the great altitude of the majority of the falls of water, and thirdly, on account of the value of the enterprises usually employing this branch of engineering.

On account of the scarcity of water during a large portion of the year, many of our mills and factories are compelled to use steam power a part of the year, whereas if they understood the best methods of applying water and employed the most economical hydraulic motors they would be able, in many instances, to dispense with their engine altogether, or at most not be required to use it more than a few months. The use of water as a motor has not been studied as a science generally, but those having water power have accepted most any suggestion that had been first proposed without investigating its merits or ascertaining the facts concerning its highest utility.

Men have jumped at conclusions, hence many of otherwise promising enterprises have proved disagreeable and expensive failures. All this has resulted from absolute ignorance of the science of hydraulics. We mention two instances of such examples that have come under our observation:

A wealthy company determined to build a flour mill on a valuable water power in a growing young city. They were assured by, as they supposed, competent judges that they had ample power and fall to drive at least five run of burrs and all the machinery necessary for a flour mill of that capacity. They employed a first-class millwright, as they supposed, who, by the way, was a member of the Legislature from a distant county of the State, and of course he ought to know. His plans were approved and the building commenced. Other millwrights were employed, consultations among men were frequent, but as is customary among mechanics the work was done according to order. The building was erected, and as it had been all *fitted together first*, it came together after some few alterations. The machinery was ordered from the East, and the manufacturers of the burrs were ordered to make one burr for each set to run one way and the other the opposite way for the other side of the same shaft, for each shaft was to drive two pair of burrs. Also a new and improved dress was required to be put into two pair of the burrs—*an idea* of the boss builder and contractor. He would not order the water wheels from the East, for he had an "*idea of his own*," and he could make as good water wheels as ever were made. Four 48-inch wheels were made and brought to the mill. An old millwright who saw them before they were put in the penstock, said "that there would be no harm to worship them, for there was nothing like them in heaven above or in the earth beneath." Previous to their construction a young hydraulic engineer had met the boss and tried to show him that the wheels he was building would not do, and to convince him of the fact made a calculation to show him how much water each wheel would use, and concluded that each wheel would use more water than there was in the race, and that each wheel would only make so many revolutions under the head. But he *knowed* better. After the conversation was over he slipped the paper into his vest pocket, for on it was a calculation he did not know how to make, and that was to get the revolutions of his wheels under the head.

When the wheels were put in *the mill would not go!* The water all ran through one wheel, and all that vast mill was a stupendous failure. The burrs had to be redressed at the mill; one new wheel was purchased the same size as the other four, and it drove all the mill and made a success of it; but not without immense loss to the company and until a competent millwright took hold of the job, and the former member of the Legislature was sent home to brood over the misfortunes of unappreciated genius.

The other was a case where the parties wished to erect a 20-stamp quartz mill. They had 115 feet fall of water, and ordered by telegraph a 30-inch wheel. The water was to be conveyed to the wheel by a *six-inch pipe*. The party of whom the wheel was ordered happened in the neighborhood, and on inquiry found out the conditions of the water power, and succeeded in convincing the parties that their millwright had made a great blunder, and ordered a wheel very much smaller in size and a pipe ten times the capacity of the previous one, and the mill was a success.

Necessity of Care in Calculations.

Where care is used in investigation of the actual value of the pounds of power in any given mill privilege by a competent hydraulic engineer, no risk at all need be run to secure absolute success in the enterprise.

There are, however, many on this coast who claim to know all about hydraulics, and will give their opinion about the merits of this or that proposition who cannot in a dozen months calculate the spouting velocity of water under a sixteen-foot head, or tell by calculation how many revolutions any sized water-wheel would make under that head. But their opinion is based on something they once saw or heard some one tell about. No man is a competent millwright who cannot make the calculations necessary for his work. He who cannot is only a jour. and no mechanic. Where water is scarce the exact facts ought to be known. First—What is the hight of fall that can be secured in fact? Second—What is the actual number of cubic feet of water per minute? This will determine the actual horse power that can be depended on, and will determine the capacity of the mill to be built. Or if the quantity of water is variable, then what is the smallest quantity at the lowest stage of water and the opposite items? Then build to suit the circumstances.

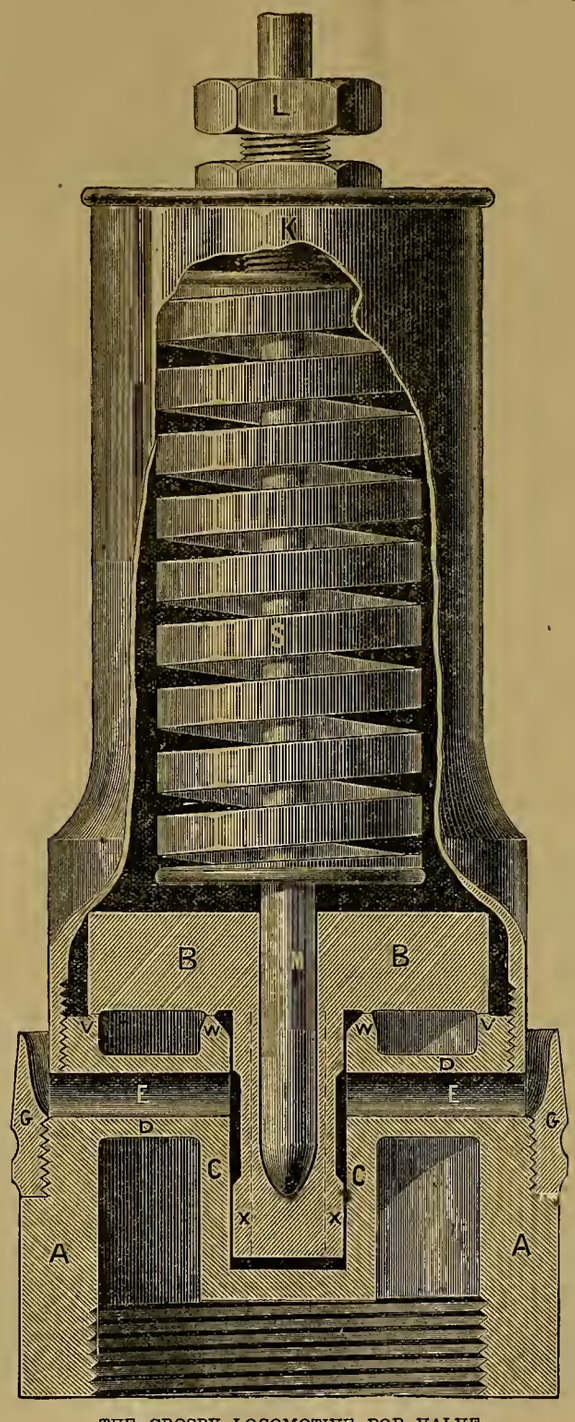
If the lowest or smallest quantity of water is determined, then a mill of that capacity can run all the time, and if a sufficient quantity can be secured to increase the capacity, and it will pay to build for part of a year's work, then build in view of that fact. Where water is scarce and the fall moderate or high, no flumes should be constructed at all, but iron pipes used, which are cheaper than any flume, the size and capacity of which could be determined by a competent engineer. This is of vital importance. None but one of experience can direct in this matter without jeopardizing the success of the enterprise.

The Altitude of Falls is Often Wonderful on this Coast.

There are hundreds of small streams in our mountain regions flowing from great hights, and often, in a distance of one-fourth to a half mile, fall a hundred feet or more. All these streams afford wonderful water power, and are allowed to run to waste for want of a proper knowledge of their value. As a general thing any quantity of water that will flow through a box one foot square, with an ordinary grade of one-fourth of an inch to the rod, will yield a handsome power, if conducted to a reasonable altitude. For instance, such a quantity of water under thirty feet fall will give about ten-horse power and drive a small country mill, or will give sufficient power for a five-stamp quartz mill. Said water conducted to 100 feet fall will give over forty-horse power, and so on to various hights. But all these facts should be submitted to a competent hydraulic engineer. In general, civil engineers have not sufficient information on hydraulics to give an intelligent answer to the questions which enter into these calculations.

Most civil engineers are lamentably ignorant on hydraulic subjects. There is more to be realized from special application to one part of an occupation than can be expected from one who possesses only a general information in regard to the whole of it.

Enterprise on this coast costs money. On account of our distance from the centers of trade, we are compelled to pay high prices for all kinds of machinery, as well as high rates of wages for all kinds of skilled labor, thus making enterprises on this coast, which, under ordinary circumstances, would be but light here, cost a small fortune. Hence when these enterprises are begun, if due care is observed in all the appointments, success may reasonably be expected, otherwise a vast failure, and a struggle for years to repair the damage. Incompetent persons will give advice when none of the essential data are at hand to determine what may be the results. Every man should be able to give a reason for his opinion, and that based on figures which will not lie.



THE CROSBY LOCOMOTIVE POP VALVE.

Hydraulic Difficulties.

When the hardy miner discovered that water was essential to the mining industry, to the vast majority of them it was a new element to deal with, and little was known of its merits or the difficulty of handling it. Consequently their inexperience gave them untold troubles and expense. To wash gravel in an ordinary rocker or sluice box there was no difficulty, but when they began to want it applied for hydraulic mining that was another thing; heuce, curious and wonderful were the devices employed. Soon it was discovered that water led to an elevation and conducted through pipes could be made effective, but how large and how strong was not thought of. Necessity required them to get on with as little expense as possible; hence their pipes were small in diameter and of light iron. The pressure was sometimes considerable, but their work was, they thought, effectual. Not knowing their losses, they thought they were doing well. Their pipes were soon destroyed and new ones required before those had been paid for.

Necessity and experience taught them better. Soon men of more knowledge and scientific skill showed them their error, and proposed very much larger pipes and very much stronger ones.

These were adopted, and the results were wonderful. More than ten times the force was added to the jet of water, and tons of ground were sluiced where pounds were before. Rocks of enormous size were caused to roll away from in front of the nozzle of the "little giant."

[To be Continued.]

The Crosby Locomotive Pop Valve.

We give on this page an engraving representing a full sized (2½-inch) Crosby adjustable pop valve, as designed for locomotive use. Each of these valves is tested under steam pressure and set to open at the exact point desired, and is adjusted to close at about two pounds reduction ordinarily. Both of these points can be readily changed without removing it from the boiler or reducing steam. The following explanation will make the working of the valve easily understood: The valve proper, *BB*, rests upon two flat annular seats, *VV* and *WW*, on the same plane, and is held down against the pressure of steam by the steel spiral spring, *S*. The tension of this spring is caused by screwing down the threaded bolt, *L*, at the top of the cylinder, *K*. The area contained between the seats, *W* and *V*, is what the steam pressure acts upon, ordinarily, to overcome the resistance of the spring. The area contained within the smaller seat, *WW*, is not acted upon at all until the valve is open. The large valve, *VV*, is formed on the upper edge of the shell or body of the valve, *AA*. The smaller seat, *WW*, is formed on the upper edge of a cylindrical chamber or well, *CC*, which is situated in the center of the body of the valve, and is held in its place by four arms, *DD*, radiating horizontally at right angles to each other and connecting it with the body of the valve. These arms are hollow and form four passages, *EE*, for the escape of the steam or other fluid from the well into the air when the valve is open. This well is deepened so as to allow the wings, *XX*, of the valve proper to project down into it far enough to act as guides. The area of the apertures, at the outer ends of the passages through the arms, is reduced more or less at will by screwing up or down the adjustable ring, *GG*.

When the pressure under the valve is within about one pound of the maximum pressure required, the valve will open slightly and allow the steam to escape under the larger seat into the cylinder, thence into the air; the steam is also forced under the smaller seat into the well and thence through the passages in the arms into the air. When the pressure attains the exact maximum point the valve is lifted so as to force the steam into the well faster than it can escape through the apertures in the arms. A pressure will then accumulate under the inner seat in excess of what is required to overcome the resistance of the spring and at once forces the valve wide open and relieves the boiler. The valve there at once slowly settles down and so continues until the area of the opening, under the inner seat is smaller than the area of the apertures in the arms for the escape of steam; the pressure then ceases and the valve promptly closes. The points of opening and closing are easily adjusted; the former by screwing the threaded bolt at the top of the cylinder either up or down, and the latter by screwing up or down the ring surrounding the outside shell or body of the valve. Messrs. Parke & Lacy, 21 and 23 Fremont St., are agents for the valve for this coast.

REVIVAL OF MINING.—All signs in New York city, says the *Mail*, indicate a speedy and great revival of mining interests. We observe that there is a steady increase of private companies. There are over a hundred good mines held in this city, which are being mined and developed as investments and properties. For convenience the owners have incorporated them, but the stock is not obtainable. This fact is a gratifying one, as it shows clearly that the prejudice against mining as a legitimate business pursuit is vanishing utterly.

Globe District.

At no time since the creation of the world has Globe district shown such evidences of thrift as now. Every where is heard the sharp clink of the resounding hammer and drill head, and detonating Hereules and Giant powder as it veins the throbbing air with glittering and somber precious metals. All are happy, and no truthful miner who rcalizes that he has a soul to save will say, "I hold over you Pard."

We have heen puzzled to know why it was that Providence, in His beneficent wisdom, made his plant here pay from the grass roots down, and will still be at a loss to know why it is that Globe district is more favored in that respect than any other bonanza district in America, unless it was His knowledge of the fact that citizens of the district would erect a M. E. chureh that would comfortahly seat a thousand. Every camp of the district is filled with light-hearted miners, who know that the good time is near, and others have fixed the date when fortunc will smilingly come with hoth hands full and release them from hegrimmed lahor, and throw an old shoe after them for luck, as they go their several ways to greet the girls they left behind them; others who had given bonds to society, by taking a wife, hefore leaving the happy haunts of men, where they sometimes see a circus, will, in their heart of hearts, bless the "plant" and guiding star that led them hither where they so quickly filled their cornucopias, not for themselves alone, but for the comfort and gratification of those who are dearer to them than all the world besides. Globe district is a great big "dimple in the mountain," and until recently has heen *a terra-incognita* except to pioneers who would hreast a mountain trail, no matter how steep or long, to satisfy the truth or falsity of a whisper that their efforts would be rewarded hy discoveries of rich ledges. or pay dirt in placer diggings, "just over there." To such men the world owes its knowledge of the existence of this great mineral helt, and for finding passable roads into it, and establishing short paths to school. Without them there would be no railroad loop like that between Kern valley and the Mohave desert to point to as exhihitiog "a remarkable triumph of engineering science." Their discoveries created the necessities for railroads, the steam engine and quartz battery; they cleave and tunnel mountains, precede science, and open the way for the mechanic and artisan; and while parting the fringe of civilization preparatory to another step in an unexplored country, they are bnt seeking another jewel to place in the diadem of eivilization. No one of this class were more courageous or deserving of their country's merited regard than W. A. Holmes, William Hope and others of the first that made a halt, a camp and a mining location in (now) Globe district. —*Silver Belt.*

THE "GEM" GOLD MINE.—This property is situated ahout three miles from Pinal city, in the Queen canyon, with a good road almost to the mouth of the tunnel, and is part of the Wideawake company's property. The explorations consist of a tunnel of 300 feet, the ledge showing a width of five and one-half feet in the tunnel. A cross-cut is beingrun to the main ledge which shows ahout 8,000 tons on the surface where the vein crops out five feet wide, averaging $50 in gold. The Wideawake prospecting and mining company have now operated in Pioneer district for the past three years, and have during that doubtful and often stormy period, never failed to pay their hands, which we regret to say has not always been the case with companies. They have now a magnificent property, which is evidently appreciated on the San Francisco Stock Exchange—the shares having risen from 7 cents to $2, within the past year—and a further rise may be confidently looked for on the erection of reduction works. Although no free gold whatever has yet been brought to sight, the ore has proved, on assays, to contain from $50 to $852 in gold, and $133 in silver. On striking the main ledge, the San Francisco gentlemen, who constitute the company, will certainly erect a mill, the site for which is within 100 feet of the mine.—*Pinal Drill.*

EDISON'S LATEST.—Edison proposes a still bolder scheme. He would insulate the track, "on tar, rubher or something," and pump the electricity into it from engines placed say ten miles apart. From the charged rails the mysterious fluid would pass through the driving wheels to the machinery and after doing its work escape again to the rails. He believes that he can thus "drive a train 25 miles an hour over an uneven country, without grading the road bed at all, and he estimates the cost of a light road of this character at about one-fourth that of the average narrow gauge road. This sounds like a wild statement, but who knows what science may yet accomplish?

BULLION TAX.—The following is the tax return of hullion on the mines of Lincoln county for the quarter ending March 31st, 1880:

Great Eastern S. M. Co.	$ 38.46	$ 1.31
Brisacher & Co	179.92	6.12
Meadow Valley S. M. Co	805.42	26.38
National mine	96.50	3.28
Queen of May mine	95.10	3.23
Raymond & Ely mine	4845.02	164.73
Unknown mine	667.00	22.70
Valley M. & M. Co	980.00	33.32
Volcano mine	145.70	4.95
Raymond & Ely, tailings	105.00	3.57
Total tax		$260.59

RAILROAD ASSESSMENTS.—In Sacramento county the railroads are assessed by the State Board of Equalization as follows: Central Pacific, $830,724; California Pacific, $8,005; Amador Branch, $199,500; Sacramento and Placerville, $330,688. In Amador: Amador Branch, $84,000. In Butte: Central Pacific, $911,880; California Northern, $107,794. In Calaveras: Stockton and Copperopolis, $8,837. In Colusa: Northern railway, $600,760. In El Dorado: Sacramento and Placerville, $208,413. In Nevada: Central Pacific, $612,986; Nevada County Narrow-Gauge, $188,826. In Placer: Central Pacific, $2,284,766; Nevada County Narrow-Gauge, $37,403. In Shasta: Central Pacific, $380,963. In Sierra: Central Pacific, $43,567. In Solano: California Pacific, $640,462; Northern Pacific, $221,367; Vaca Valley, $188,600. In Sonoma: S. F. & N. Pacific, $1,066,533; North Pacific Coast, $146,959. In Sutter: Central Pacific, $202,640. In Tehama: Central Pacific, $821,502. In Yolo: California Pacific, $496,358; Northern railway, $270,995; Vaca Valley, $107,025. In Yuha: Central Pacific, $321,589; California Northern, $89,208.

THE *Inyo Independent* gives the following approximate altitudes of the various places named, in feet above sea level: Virginia City, Nev., 6,026; Aurora, 7,765; Bodie (Maine street), 8,500; Caudelaria, 5,842: Columbus, 4,922; Silver peak, 5,014; Summit between Silver peak and Lida, 7,682; Lida valley, 6,486; Buster mine, 8,072; Fish Lake valley, about 5,600; Gilbert's ranch, Deep Spring valley, 6,150; Summit pass on the White mountains between Deep Spring and Big Pine, 8,900; Owens River hridge, near Big Pine, 4,416; Independence, Inyo county, 4,000.

IN 1849, when gold was discovered in California, there was not hetween the Missouri river and the Pacilic ocean, or from Manitoha to Sonora, over 25,000 persons of Caucasian stock, and not-3,000, all told, speakingin English as the tongue of their nativity. Now there are 3,000,000 persons in the same area; there are 10,000 miles of railroad, and nearly twice that of telegraph; there is a property valuation of at least $3,000,000,000, six prosperous States and nine Territories, growing in wealth and population, now producing in the precions metals at least $85,000,000 annually, and also embracing the three largest wheat-growing States in the Union.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued. wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Concentration of Ores (of all kinds), including the Chloriuation Process for Gold-bearing Sulphurets, Arseniurets, and Cold and Silver Ores generally, witb 120 Lithographic Diagrame. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounde throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery etc., which alone are of the greatest value. PRICE, $7.50

ROASTING OF COLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. 1880.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 156 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, $3.00 coin, postage free.

AUDIPHONES For Deaf People.

NOW READY!
OF IMMENSE PRACTICAL VALUE TO EVERY SAW USER.
GRIMSHAW on SAWS!
History, Development and Action; Classification and Comparison; Manufacture, Care and Use of SAWS of all kinds. Quarto. 234 Illustrations.
By ROBERT GRIMSHAW, Ph. D., M. E.,
Member of the Jury on Wood-working Machinery at Paris Exposition of 1878.

This thorough work, impartially written in a clear, simple and practical style, treats the Saw scientifically, analyzing its action and work, and describing, under the leading classes of Reciprocating and Continuous Acting Saws, the various kinds of large and small hand, sash, Mulay, jig, drag, circular, cylinder and band Saws, as now and formerly used for crosscutting, ripping, scroll-cutting, and all other sawing operations in wood, stone and metal, ice, ivory, etc., in this country and abroad. With appendices concerning the details of manufacture, setting, swaging, gumming, filing, etc., tables of gauges, log measurements from 10 to 24 feet, and from 12 to 96 inches, lists of al U. S. Patents on Saws from 1790 to 1880, and other valuable information. Elegantly printed on extra heavy paper, wide margin, copiously indexed

Owing to an increase of nearly 100% in number of pages and illustrations since first projected, the price is this date made $2.50, postage paid.

W. BRUCKNER'S

ROASTING FURNACE
AND
Ore Pulverizers.

(Awarded the Premium Gold Medal at Naples, Italy.)

The furnace is especially adapted for roasting rebellious ores; there are more than fifty in use in Colorado, giving perfect satisfaction.
The Ore Pulverizer is built in different sizes. It is preferable to Stamp Mills because it requires less power and less repairs than Stamps. No extra expense for setting up, and no foundation. Less weight and less cost than stamps.
Furnished also in sections for packing.

Ingersoll Rock Drills.

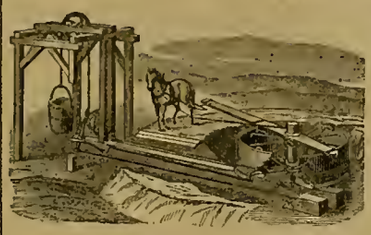
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing

ORES SAMPLED, TESTED, ASSAYED.

Mines and Mining in Tuolumne County.

EDITORS PRESS:—With tbe genial weather, an abundance of water and some oonsiderahle investment of outside capital, we have to report a rather active condition of affairs, and a generally cheerful outlook for the mining interests of Tuolumne county. During the past winter tbis industry languished, the deep snow and the cold weather preventing much work being done. But for this season of inactivity we hope to make up before the summer is over, operations on many quartz claims having this spring been commenced for the first time, while on othere they have been renowed or extended. Then, the plentiful flow of water, hesides filling the ditches and insuring a full supply for all, has afforded means for washing in . localities where only at long intervals any work could be done. Much gold will this year be gathered from the gulches hereahout that still pay good wages, as they could he worked only in seasone like the present when free water was to be had in ahundance. It looks now as if more gold would be taken out in Tuolumne this summer than during any summer for many yeare past. To particularize a little the following may be noted as indicating what is heing done here in tbe way of

Quartz Prospecting and Mining.

And, firet, it may be premised that we have bere, as in Calaveras on the north and Mariposa on the eouth, two quartz-bearing helts traversing the county in a generally north and south direction, and separated from each other by a space of ahout 14 miles. The most westerly of these systems, which carries the so-called Mother Lode and its attendant ore deposits, occurs mostly in the slates, while the other occurs mostly in granite, though the walls of both are in placee composed of these rocks alternately. Standing in or near the west-lying eyetem the most prominent minee are the App, Heslep, Silver, Harrie, Rawhide, Patterson, Waters, etc., the leading properties along the other bslt, if we extend it according to the view of most miners, being the Ferguson, Mt. Jefferson, Buchanan, Spring Gulch, Star King, Coneuello, New Albany, Eureka, Mastodon, Louisiana, Soulsby, Confidence, Hazle Dell, Evans, etc. There are, of course, many good quartz claims lying outside both thesc systems, it being open to question whether some of those above mentioned can, strictly epeaking, be considered as belonging to either. All, however, lie in or near the path of one or the other of these mineralized zones, partaking of the characteristics of that to which they respectively appertain.

The first quartz mining done in this county was on some of these claims located along the Mother Lode, the several enterprises here set on foot having met with varying fortunes. For the first few years these ventures, as was the case elsewhere throughout the county, were generally prosperous. Then ensued an era of embarrassment and stoppage, caused mostly by inexperience, prevailing high prices and imperfect machinery, which troubles were sometimee aggravated by an indifferent or perhaps a really bad management. This era of suspension and disaster covered a period of several years, after which things began to mend, and for the past year or two have heen all the while growing better. As evidence of tbis we have the fact that active operations have been, or shortly will be, resumed in nearly every case where they had been suspended.

Resuscitated Properties, Live Mines, Etc.

Without reciting every instance that might justly be classified under this head, the following examples will serve to ehow how much is being done and how general the resumption of quartz mining has of late been in Tuolumne county. The Confidence mine, after a brilliant caresr followed by a long interregnum, is again running its 40-stamp mill and making a monthly production of $80,000, which there is every reason to helieve can be kept up for a long time to come. Of the Ferguson mine, just over the line in Mariposa, very nearly tho eame may be eaid, except that the product made here is not quite so large. The Mount Jefferson, Spring Gulch, Star King, Coneuello, New Albany, Louisiana, Soulsby, Live Oak, Evans, and Riverside mills are all running, except perhaps one or two that may have shut down for temporary purposes. These mines, which are all on or near the easterly ore channel, are well opened up, have much ore in sight, and are outfitted with mills carrying from five to thirty etamps each. In the same channel are located a number of claims on which much work has been done and valuable ore developments made, and from some of which a great deal of bullion has in former daye been taken out. In this list is included the Buchanan, Eureka, and the Hazle Dell, on all of which mills were once put up and run with profit till affairs took an evil turn, caused by the exhaustion of the ore chute, influx of water, dissensions among owners, etc. Every one of these mines could, with a small amount of money, be put on a paying basis and for years be run with satisfactory results. Then there are here other mines, like the Lady Washington and Mastodon, that, having already been partially opened, could at little expenss be effectually explored, and with every prospect of developiug into remunerative properties.

On the Mother Lode

There has, in like manner, occurred some, thougb perhaps not quite so marked a revival of quartz mining, nearly every prominent claim there bsing now worked or prspared for active operations. Without pursuing the subject further in detail, it may he stated that, whereas, there were four years ago not ovsr half a dozen quartz mills running in this county there are now at least fivs times that number in successful opsration, some of those lately put up heing establisbmente of large capacity.

And the Cause.

That so many improvements could not have heen made and so much progress effected here in mining without the aid of money from outside sources, it ie needless to say. To this sort of assistance euch advancement of our mining interests has, in fact, been mainly due; the capital invested having heen mostly furnished by California parties. Some of it has, however, been derived from New York, Boston and a little also from England. There has been some money lost here in mines, but lese I helieve than in any other county in California. Be this as it may, of one thing I am sure, the investments made here in mining enterprises and properties of late, will prove safe and good ones. To this remark I do not think there are any exceptions. Among the Californians who have recently put in their money here will be found some of the most shrewd and cautious operators in the State. Thus far they expreos themselves as being more than satisfied, and I predict that there will for the next few years be more California capital invested in our home mines—more even in this county alone than in countries outside. And while parties on this ooast have generally fared so well here, other purchasere have had no cause for complaint, certain New Yorkers having gotten {hold of some especially good properties. An association styled the Boston and Pacific Mining and Investing Company, have also just consummated a bargain for eome mines in this neighborhood on terme that are here considered exceptionally favorable. I am not advised as to the full extent of their purchase, but know of my own knowledge that it includes several minee of unquestionable merit with others of very great promise. One of the propertiee secured by these eharp people ie outtitted with a mill and noted for carrying about tbe best grade of ore of any mine in the county. Some of the parties selling are already filled with miegivings, believing that they parted with their property for hardly a tithe of its value. But the buyers in negotiating th eir purchases enjoyed peculiar advantages, having for advisere men thoroughly familiar with the character of the minee here, while for all they bought they paid the cash or its equivalent. This company appears to be made up of live men who intend to open up and equip their mines in the beet possible etyle and run them for all they are worth. It is here believed that a great euccess awaits them. At any rate they in common with all other enterprising and energetic inveetors have the best wishes, ae they will always secure the hearty co-operation of every resident miner and well wisher of— OLD TUOLUMNE.

Sonora, Cal., May 25, 1880.

VINICULTURAL COMMISSION.—The meeting of the Vinicultural Commission held in tbis city on Monday results in permanent organization and preparation for work. A. Harasthy, of this city was cbosen President of tbe commission, and Dr. J. I. Bleasdale appointed Secretary. The commission is now coneidering tbe selection of rooms for a permanent headquarters in this city. Dr. Bleasdale has made a long study of the ecientific and practical features of viniculture and has occupied important positions as an expert in these matters in Australia. He is also familiar with the practices of the European vignerons. He is certainly possessed of experience and observation which qualify him for valuable work in the position to which he has been assigned by the commission. As yet the commission is but getting into ebape for action. We trust useful results of its labors will soon appear.

A PIONEER GONE.—We are called upon to announce the eudden demise of Cbarlce Green Gould a native of New Jersey. Mr. Gould passed away very enddenly, being sick only about a week. It was a forcible reminder of the uncertainties of life, ae it seems but yesterday eince he was pursuing his trade as carpenter in our office. Mr. G. left but few relations, his nephew (our mailing clerk) being the nearest in thie State. He was respected hy those who knew him as an honest and npright citizsn, and to his friends and relations there is a void left which will be hard to fill.

ACCORDING to the Truckee *Republican* nearly all the snow-shede between thie point and Blue Canyon will be rebuilt or repaired this summer. They have done service so long that the timbers need replacing. The work this time, we understand, will be made etronger and more capable of resisting the heavy fall of snow than tbe present sheds. It is a big job and will require the outlay of a large sum, but it will give employment to a large force of men. It will require an immense amouut of timber, and will help to make things generally lively bere.

THE Ophir ehaft will be cloeed about the 15th of June, at which time tbe mine will be in connection with tbe C. and C. shaft. Thereafter all work in the Ophir will be prosecuted through the C. and C. sbaft.

Ocean or Rail.

There is reported an increasing disposition among those bringing merchandise to this coast to patronize the car rather than the keel. It is said that by entering into contracts for exclusive overland transportation merchants can obtain low rates; which, in connection with the fact that they can save much time whicb would be consumed in a sea voyage, and thus sooner realize upon purchases at the East or ahroad, makes it a present advantage to them to ehip by rail rather than hy water. It is cbaracteristic of Californians to seize tbe present opportunity without much regard for future results or consequences, and this matter of all rail shipments eeeme to be a new manifestation of this disposition.

We are led to allusion to this suhject from the fact that our agricultural prosperity depends to such great extent upon abundant facility for ocean transportation. The cheap carriage of grain to the English and continental markets ie absolutely indispensahle to our prosperity as a State. Every shilling added to the cost of ocean freights ie a ehilling added to the cost of grain laid down abroad, and it is not added to the price obtained there, but ie taken from the reward of the producer for his labor here. Raise ocean freights and you lower the price whicb the shipper will pay our farmers. Wheat growing is a business upon a very narrow margin generally; it is a hnsiuess in which all quarters of the globe compete with us. If our meane of cheap transportation by sea are circumscribed or reduced in any way, we come hurdened to the contest.

It cannot be doubted that the tendency of our merchants to dispense with ocean carriage bither of the goods they purchase abroad, will make it impossible for ship owners to obtain cargoes for thie port which would pay them even in part for the inward voyage, and if they come here in ballast thie expense must be euper-imposed upon what would otherwise be a fair recompenee for the outward voyage. In other worde, as it appears, our wheat growers would have to etand the ship's expense for a round trip with the owner's profit added, instead of dividing this with the merchant who brings in goods for eale to our producers. Our grain growers cannot stand such an affliction. They cannot afford to pay what would be equivalent to the cost of doubling the distance hence to Europe, and than returning tribute for overland transportion of the supplies they require. This would be burning the candle at both ends. It ie hard enough to eustain a single illumination. The resnlt would be that the money which the farmer would receive for his crops would be less than the cost of production, and our grand producing interest which is now the backbone of our proeperity and progress, would no longer give livelihood to those who are laboring hard and untiringly for the modest measure of success which they now ohtain.

Ie argument needed to point tbe application of such truisms to the importers of merchandise who now seem prone to dispense with ocean carriage? It is necessary to cito the fact that the farmer is now the main reliance of those who deal in merchandise or manufactures in this State. If farmers are prosperous, if they obtain paying prices for their produce, they have money with which to obtain purchased comforts and necessaries from those who live by selling them. If the farmers have money the country merchant drives a thriving trade; if the country merchant eells well, the city importer makes quick and easy collections, and his profits accumulate. Reverse the picture; rob the producer of hie reward, and the whole mechaniem of trade moves with crying bearings, or not at all. Of what advantage then will it be to the merchant, if he saves a little per cent. and a little time by withdrawing hie patronage from the eailor whose eervices are indispensable to our prosperity as a grain-ehipping country?

This suhject is one which, upon its face, demands the attention of all who are interested in our leading industry. It would be well for farmers to discuss it, and to demonstrate to the merchant that his policy is euicidal. The merchant often needs a hint of this kind, for in his zeal to catch a present profit he is apt to overlook the influence of this act. We regard the matter of much importance to our readers, and may rccur to it.

IMPORTANT FIND OF IRON ORE.—Some residents of Seattle, W. T., recently discovered a mountain of brown hematite iron ore, which is pronounced by competent judgss to be equal to the best specimens of Lake Superior ore. It is variously eetimated to contain from 75% to 80% of pure iron by men experienced in such matters. Two sacks of the ore were brought to town, and during the early part of the week it will be smelted so as to ascertain the exact quality. The mountain is so located that the ore could be shoveled directly into the hold of the biggest vessel tbat floats without any transportation. The discoverere think they have got a better thing than a rich claim on Ruby, and if the ore turns out as rich as it is now suppoeed to be they undoubtedly have. The great intereet awakened in the manufacture of iron in western Washington will doubtless lead to the discovery of valuable deposite of the same mineral in other localities.—*Seattle Intelligencer.*

FAMINE is decimating the population of Asiatic Turkey.

News in Brief.

IN all Europe and America 63,631 breweries produce yearly 3,480,000,000 gallons of beer.

MANY Jesuits will leavs Italy for America as soon as the decrees against them are enforced.

NEW ORLEANS has shipped to France and Italy within a year 2,400,000 gallons of cotton seed oil.

THE quantity of cotton consumed in the world in 1878 was 54 timee greater than in 1778.

THE Southern Pacific railroad will pay taxee on more than $750,000 in San Bernardino county alone.

THE Chinese Embassy is at Mazatlan, Mexico. It is so numerous that no hotel can contain it.

THE New York Supreme Court has refused Mrs. Belva Lockwood admission to practice at its bar.

THIRTEEN train-wreckere in Spain have been sentenced to death and thirteen to twenty yeare imprisonment.

THE U. S revenue cutter *Corwin* sailed May 22d with supplies for whalers and the *Jeannette* exploring steamer.

THE Kansas extension of the St. Louis and S. F. railroad is completed to Wichita, 500 miles from St. Louis.

A RAILROAD will be constructed between Matamoras and Monterey, and between the latter place and Saltillo in Mexico.

SMITH, the defaulting Treasurer of North Andover, Mass., has been sentenced to eix years at hard labor in the State Prison.

ONE THOUSAND wagon loads of emigrauts are waiting on the borders of the Ute Reservation in Colorado for permission to enter.

MAJOR JOHN T. HARROLD has recovered $30,000 damages from the New York Elevated railroad for injuries eustained in a collision.

ANOTHER barn was hurned in the euhurbs of this city May 25th, being the third within two daye, the euppoeed work of incendiaries.

PRADO, the President of Peru, has arrived in New York. He says that his mission has failed and tbat he will not return to Peru.

ON Friday, 21st inst., the schooner *Joseph*, from this port for Navarro river, went ashore on Bodega head. The crew reachcd shore in safety.

THE question of the election of a colored Bishop was indefinitely postponded in the M. E. Confcrence at Cincinnati by a vote of 229 to 139.

FARMERS in Tulare county fear that the labor necessary to harvest their crops will be scarce, even at $3 per day, the rate which they propose offering.

TUESDAY morning, 25th inst., the elevator at Bauer, Torbriner & Co's etore, 547 Market street, fell a distance of 25 feet, seriously injuring 5 young women.

THE work of completing the branch State prison at Folsom has been commenced, and will be done, as far as possible, by convicte from San Quentin.

THE first passenger train ran over the Utah Southern to Milford, May 12th. Gov. Murray and party visited the mines of the Milford camp, and explored the horn eilver ore body.

HENRY CLAY, a grandson of tbe famous Senator, will accompany the Howgate Arctic Expedition as an aid to Lieut. Howgate. Mr. Clay, who is known in Kentucky as "Young Harry Clay," ie 29 years of age.

THE tunnel under the Hudson is being pushed at the rate of three feet a day by three shifts. It will cost $10,000,000, and the company anticipate having it completed in time for the great World's Fair in New York in 1883.

LARGE numbers of prospectors are reported to be leaving Leadville, Colorado, on their way to the Gunnison country. The roade from all directions are lined with wagons, and partiee mounted and on foot in quest of the new mining region.

AT Barcelona (Spain) on the 22d inst., 1,000 cotton epinners wrecked and set fire to a mill, but the police and military checked the fire and arreste6 the leaders of the mob. The Prefect of Police has issued a decree to dissolve every trade union in Catalonia.

PRESIDENT HAYES and his Cabinet and Governor Lorne, of Canada, will be invited to attend the celebration of the 250th anniversary of the eettlement of Boston, to take place on the 17th of September. The city has appropriated $25,000 for the celebration.

A CHINAMAN has been appointed a Deputy Sheriff in New York. This ie the firet case where a native of China has ever held any kind of an office in this country. He was appointed at his own request, for the protection of his countrymen in the Chinese quarter of New York.

AT the Cabinet meeting, May 25th, the only matter under conaideration was the request of the S. P. Railroad Co. for the use of troops to aid the Marshal in serving the process of the Courts. After discuseion the snbject was referred to the Attorney-General for his decision.

A MEETING was held at Stockton on Monday night to further a project for constructing a narrow-gauge railroad from Stockton to Bodie, there to connect with a projected narrow-gauge system for the State of Nevada. It was announced that Eastsrn capital will back the scheme.

A MAN in New Orleans has for pets a host of big and little spiders. He first became enamored of them on account of their thrift, courage, industry and skill. He has at length become so engrossed with them as pets that he epends his whole time with them, and does not care to see visitors.

OUR AGENTS.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

W. A. Holland—San Mateo county.

Quinine and Arsenic

Form the basis of many of the Agus Remedies in the market, and are the last resort of physicians and people who know no better medicine to employ for this distressing complaint. The effects of either of these drugs are destructive to the system, producing headache, intestinal disorders, vertigo, dizziness, ringing in the ears, and depression of the constitutional health. Ayer's Ague Cure is a vegetable discovery, containing neither quinine, arsenic, nor any deleterious ingredient, and is an infallible and rapid cure for every form of Fever and Ague. Its effects are permanent and certain, and no injury can result from its use. Besides being a positive cure for Fever and Ague in all its forms, it is also a superior remedy for Liver Complaints. It is an excellent tonic and preventive, as well as cure, of all complaints peculiar to malarious, marshy and miasmatic districts. By direct action on the liver and biliary apparatus, it stimulates the system to a vigorous, healthy condition.

For Sale by all Dealers.

Fresh attractions are constantly added to Woodward's Gardens, among which is Prof. Gruhor's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

Extra Copies can usually be had of each issue of this paper, if ordered early. Price, 10 cents, postpaid.

Chew Jackson's Best Sweet Navy Tobacco.

Mining and Other Companies.

Persons interested in incorporated ehares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

DIVIDEND NOTICE.

OFFICE OF THE

Eureka Consolidated Mining Company,

Nevada Block, Room No. 37, San Francisco, May 15, 1880. At a meeting of the Board of Directors of the above named Company, held this day, a Dividend (No. 55) of Fifty Cents (50c) per share was declared, payable on THURSDAY, May 20, 1880. Transfer books closed until 21st instant.

W. W. TRAYLOR, Secretary.

Atlanta Mining Company.—Location of

principal place of business, San Francisco, California. Location of works, West Tintic Mining District, Juab County, Utah.

Notice is hereby given that at a meeting of the Board of Directors, held on the Second day of January, 1880, an assessment (No. 1) of Five Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, room 7, No. 420 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the Fifth (5th) day of February, 1880, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Friday, the Twenty-Seventh (27th) day of February, 1880, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Thursday, February 26th, 1880, and the day of sale to Monday, the 22nd day of March, 1880. By order of the Board of Directors.

A. F McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

POSTPONEMENT.—The delinquent day of the above named Company is hereby postponed until Wednesday, the 17th day of March, 1880, and the day of sale to Saturday, the 10th day of April, 1880. By order of the Board of Directors.

A. F. McGREW, Secretary.

Office—Room 7, No. 420 Montgomery St., San Francisco, California.

Entirely different from other Saws. When dull, sharp teeth, which only cost a trifle, can be inserted in a few minutes, without taking the saw off of the mandrel, and no skill is required in doing it. Send for Catalogue showing their vast superiority. More of them are being sold than of any other kind, and we are altering all other kinds to the Chisel Tooth.
